Introduced Bill and Mary Gates

PDF of book : [HB0053][GDrive]

"Their daughter Mary was born in Seattle in 1929. A vivacious young beauty she grew up among some of the most prominent families in the Northwest. Like her mother before her, Mary Maxwell met her future husband, a tall, **athletic, prelaw student by the name of Bill Gates, Jr.,** while she was a co-ed at the University of Washington. A school cheerleader, Mary was as outgoing and gregarious as Bill was shy and reserved. A mutual friend, Brockman Adams, had introduced the couple while Adams was student body president, and Mary was an officer in the student government association. (Adams went on to a career in politics, serving as secretary of transportation under 7 President Jimmy Carter. He is currently one of Washington's U.S. senators and remains a close friend of the Gates family.)"

United States

Branch/service

United States Navy

Years of service

1944–1946

Brockman "Brock" Adams (January 13, 1927 – September 10, 2004) was an American politician and member of Congress. A Democrat from Washington, Adams served as a U.S. Representative, Senator, and United States Secretary of Transportation. He was forced to retire in January 1993 due to public and widespread sexual harassment, sexual assault and rape allegations.[1]

Early life and education[edit]

Adams was born in Atlanta, Georgia, and attended public schools in Portland, Oregon. He attended the University of Washington at Seattle where, in 1948, he was elected president of the student government (ASUW) and was the first student to both serve in that post and receive the President's Medal of Excellence as the University's top scholar.[2] He graduated in 1949 and was admitted to Harvard Law School, where he earned his law degree in 1952.

Naval and legal career[edit]

Adams served in the U.S. Navy from 1944 to 1946, and was admitted to the Washington state bar in 1952, opening a private practice in Seattle. He was a member of the American Bar Association.

Adams taught law at the American Institute of Banking from 1954 to 1960, and served as United States Attorney for the Western District of Washington from 1961 to 1964.[3]

Political career[edit]

U.S. House of Representatives[edit]

Adams was elected as a Democrat to the House and served six terms beginning January 3, 1965. He was chairman of the newly created Budget Committee during the 94th Congress, and was considered a strong candidate for Speaker of the House. On January 22, 1977, Adams resigned to become the fifth Secretary of Transportation following his appointment by President Jimmy Carter and confirmation by the Senate. After resigning his Cabinet post on July 20, 1979, Adams resumed law practice, this time in Washington, D.C., where he was a lobbyist for CSX Corporation and other railroad carriers.

Adams at Cabinet Meeting

U.S. Senator[edit]

On November 4, 1986, Adams was elected to the U.S. Senate, narrowly defeating incumbent Republican Slade Gorton with 50.66% of the vote.[4] Serving one term, he compiled a liberal record and was strongly supportive of his party's leadership.

Sexual assault, rape allegations[edit]

Kari Tupper, the daughter of a longtime friend, accused Adams of drugging and assaulting her in 1987.[5][6]

In 1992 eight women made statements to *The Seattle Times* alleging that Adams had committed various acts of sexual misconduct, including sexual assault, molestation and rape.[7] Multiple women said they were drugged after being served suspicious drinks and either assaulted or raped.[8]

In the exposé, an unnamed source said, "Adams had long been known by his staff and associates for aggressively kissing and handling women within his reach."

A former Democratic Party activist alleged that in the early 1970s, when Adams was serving in the House of Representatives, he invited her to a Seattle bar, where he drugged her with what he called "Vitamin C", after she recalled suffering from a cold. The woman said Adams followed her home, pushed her onto a couch and raped her.[9]

A young woman in her thirties told *The Washingtonian* that while she was seated to Adams's right at a formal luncheon shortly after she had taken a new job on Capitol Hill, he slid his hand under her skirt to the upper part of her thigh, whereupon she tried to move her leg away from him. Failing that, she said she tried to remove his hand, but Adams dug his fingers into her skin.[10]

Forced retirement[edit]

Adams denied the allegations in a press conference. But already under the spotlight due to previously aired allegations that he drugged and molested a young female aide in 1987, a highly publicized matter in which no charges were brought, Adams was forced to drop out of his reelection campaign.[11] He never lost an election, and lived in Stevensville, Maryland, until his death of complications from Parkinson's disease.[12]

Legacy[edit]

Adams's willingness to plunge into controversial issues was evident in the contrasting assessments of his tenure and accomplishments during a tumultuous period in transportation. *The Wall Street Journal* in 1979 called him the "biggest disappointment" in the Carter cabinet, while Public Citizen President Joan Claybrook, who led the National Highway Traffic Safety Administration under Adams, called him "absolutely one of the best transportation secretaries we've ever had".[13] Adams was also a member of the Phi Beta Kappa Society.

#MeToo Resurgence[edit]

In light of the 2017 #MeToo Movement, some see Adams's legacy as a powerful politician who systemically abused his power over young women as emblematic of Washington's culture of harassment.[14]

In 2020, an extensive PBS exposé concerning the workplace for women in the 1990s in Washington, D.C., described the climate of "sexual harassment and sexual entitlement [that] existed in some offices in the Senate", driven by some male senators whose behavior was well known on Capitol Hill. There was a list of congressmen that young women were told to keep away from, which included Adams, Bob Packwood, Strom Thurmond, and Ted Kennedy.[15]

Website akamai.com

Akamai Technologies, Inc. is a global content delivery network (CDN), cybersecurity, and cloud service company, providing web and Internet security services.[2][3] Akamai's Intelligent Edge Platform is one of the world's largest distributed computing platforms. The company operates a network of servers around the world and rents out capacity on these servers to customers who want their websites to work faster by distributing content from locations near the user. When a user navigates to the URL of an Akamai customer, their browser is directed to one of Akamai's copies of the website.

History

Akamai Technologies entered the 1998 MIT $50K competition with a business proposition based on their research on consistent hashing, and were selected as one of the finalists.[4] By August 1998 they had developed a working prototype, and with the help of Jonathan Seelig and Randall Kaplan, they began taking steps to incorporate the company.[5]

In late 1998 and early 1999, a group of business professionals joined the founding team. Most notably, [Paul Lewis Sagan (born 1959)], former president of New Media for Time Inc. and [George Henry Conrades (born 1939)], former chairman and chief executive officer of BBN Corp. and senior vice president of US operations for IBM. Conrades became the chief executive officer of Akamai in April 1999 and led the company from start-up to sustained profitability and positive free cash-flow before turning the reins over to Sagan in 2005.[6][7][8] The company launched its commercial service in April 1999 and was listed on the NASDAQ Stock Market from October 29, 1999.[9]

On July 1, 2001, Akamai was added to the Russell 3000 Index and Russell 2000 Index.[10]

On September 11, 2001, co-founder [Daniel Mark Lewin (born 1970)] died in the September 11 attacks at the age of 31 when he was stabbed during his flight aboard American Airlines Flight 11, the first plane to crash into the World Trade Center.[11]

In 2005, [Paul Lewis Sagan (born 1959)] was named chief executive officer of Akamai. Sagan worked to differentiate Akamai from its competitors by expanding the company's breadth of services.[8] Under his leadership the company grew to $1.37 billion in revenues.[12] Sagan served as chief executive officer until co-founder and current CEO, [Frank Thomson Leighton (born 1956)], was elected to the position in 2013.[13] In July 2007, Akamai was added to the S&P 500 Index.[14]

Akamai's headquarters are in Kendall Square. Akamai started out in Technology Square and later expanded to multiple buildings in Cambridge Center. They consolidated their offices in a purpose-built building at 145 Broadway in December 2019.[15]

Technologies

Akamai Intelligent Edge Platform

The Akamai Intelligent Platform is a distributed cloud computing platform that operates worldwide. It is a network of over approximately 275,000 servers deployed in more than 136 countries.[16] These servers reside in roughly 1,500 of the world's networks gathering real-time information about traffic, congestion, and trouble spots.[16] Each Akamai server is equipped with proprietary software that uses complex algorithms to process requests from nearby users, then serve the requested content.[17]

Content delivery process

Akamai content delivery to a user

The content delivery process begins with a user submitting a request to a browser. When a user enters a URL, a DNS request is triggered and an IP address is retrieved. With the IP address, the browser can then directly contact the Akamai edge server for subsequent requests.[18] In a content delivery network structure, the domain name of the URL is translated by the mapping system into the IP address of an edge server to serve the content to the user.[17]

Akamai delivers web content over its Intelligent Platform by transparently mirroring elements such as HTML, CSS, software downloads, and media objects from customers' servers. The Akamai server is automatically chosen depending on the type of content and the user's network location. Receiving content from an Akamai server near the user allows faster downloads and less vulnerability to network congestion. Akamai claims to provide better scalability by

from an Akamai server near the user allows faster downloads and less vulnerability to network congestion. Akamai claims to provide better scalability by delivering the content over the last-mile from servers close to end-users, avoiding the middle-mile bottleneck of the Internet.[19] The Download Delivery product line includes HTTP downloads for large downloadable objects, a customizable application for consumers, and analytics tools with metrics that monitor and report on the download process.[20]

Peer-to-peer networking

In addition to using Akamai's own servers, Akamai delivers certain content from other end-users' computers, in a form of peer-to-peer networking.[21][22]

Network Operations Command Center

Akamai's Network Operations Command Center (NOCC) is used for proactive monitoring and troubleshooting of all servers in the global Akamai network.[23] The NOCC provides real time statistics of Akamai's web traffic. The traffic metrics update automatically and provide a view of the Internet traffic conditions on Akamai's servers and customer websites.[24]

State of the Internet

The State of the Internet report is a quarterly report Akamai releases based on data gathered from its Intelligent Platform, which provides global Internet statistics such as connection speed, broadband adoption, attack traffic, network connectivity, and mobile connectivity.[25][26]

Visualizing the Internet

Akamai's data visualization tools display how data is moving across the Internet in real-time. Viewers are able to see global web conditions, malicious attack traffic, and Internet connectivity.[27] In addition, the net usage indices monitor global news consumption, industry specific traffic, and mobile trends.[28] Akamai also offers the Internet Visualization application, which allows users to view real-time data on their mobile device.[29]

OPEN Initiative

On October 9, 2013 Akamai announced its Open Initiative at the 2013 Akamai Edge Conference. OPEN allows customers and partners to develop and customize the way they interact with the Akamai Intelligent Platform. Key components of OPEN include system and development operations integration, real-time big data integration, and a single-point user interface.[30]

Primary domains

Akamai Technologies owns about 60 other domains, but the primary domains it uses include:

Customers

On July 21, 1999, at Macworld Expo New York, Apple and Akamai announced a strategic partnership to build Apple's new media network, QuickTime TV (QTV), based on QuickTime Streaming Server.[33] Both companies later announced that Apple had made a $12.5 million investment in the company the previous month.[34] Apple continues to use Akamai as their primary content delivery network[35] for a wide range of applications including software downloads from Apple's Website, QuickTime movie trailers, and the iTunes Store.[36]

In September 1999, Microsoft and Akamai formed a strategic relationship to incorporate Windows Media technology in Akamai's FreeFlow service, as well as to facilitate the porting of the FreeFlow product to the Windows platform; this relationship exists to this day.[37] Microsoft Azure offers Akamai (along with Verizon) as options for its "standard" CDN service.[38]

Arabic news network Al-Jazeera was a customer from March 28, 2003, until April 2, 2003, when Akamai decided to end the relationship.[39] The network's English-language managing editor claimed this was due to political pressure.[40]

In June 2008, The NewsMarket teamed with Akamai to accelerate dynamic content and applications to global media ahead of the Beijing Olympics.[41]

In June 2008, The NewsMarket teamed with Akamai to accelerate dynamic content and applications to global media ahead of the Beijing Olympics.[41]

The BBC iPlayer uses Akamai to stream its recorded and live programs, focused through an XML playlist.

The entire China Central Television website, including its streaming video, has been hosted on Akamai's edge servers since late 2009.[42][43] Hulu uses Akamai for hosting video.[44] MIT OpenCourseWare utilizes Akamai's EdgeSuite for its content delivery network.[45]

Trend Micro uses Akamai for their Housecall antivirus application.

Valve's Steam service uses Akamai's Content Delivery Network for storing screenshots and icons uploaded by users.

Akamai provided streaming services to ESPN Star (India) during the course of the ICC Cricket World Cup 2011.[46]

Rackspace's Cloud Files use Akamai's Content Delivery Network (CDN) for storing its customer's files.

Other customers include Adobe Systems, Airbnb, AMD, AutoTrader.com, COS, ESPN, The Great Courses, Hewlett-Packard, Hilton Worldwide, IBM, J. C. Penney, Jehovah's Witnesses, MTV Networks, NASA, National Academy of Recording Arts and Sciences, NBC Sports, Pearson Education, Red Bull GmbH, Red Hat, Sony PlayStation and Yahoo!.[47]

In August 2017, Nintendo launched its new game console and mobile gaming application simultaneously around the world via Akamai's Media Delivery Solutions.[48]

Acquisitions

- On February 10, 2000, Akamai acquired Network24 Communications[49] for an aggregate purchase price of $203,600,000.[50]
- On April 20, 2000,[50] Akamai acquired InterVU Inc.[51] for an aggregate purchase price of $2,800,000,000.
- On July 25, 2000, Akamai acquired CallTheShots, Inc., for an aggregate purchase price of $3,700,000.[50]
- On June 10, 2005, Akamai acquired Speedera Networks, Inc. for an aggregate purchase price of $142,200,000.[52]
- On December 13, 2006, Akamai acquired Nine Systems, Inc.,[53] for an aggregate purchase price of $157,500,000.[54]
- On March 13, 2007, Akamai acquired Netli Inc. (Netli),[55] for an aggregate purchase price of $154,400,000.
- On April 12, 2007, Akamai acquired Red Swoosh Inc.[56] for an aggregate purchase price of $18,700,000.[57]
- On November 3, 2008, Akamai acquired aCerno Inc.,[57] for an aggregate purchase price of $90,800,000.[58]
- On June 10, 2010, Akamai acquired Velocitude LLC,[59] for an aggregate purchase price of $12,000,000.[60]
- On February 7, 2012, Akamai acquired Blaze Software, Inc.,[61] for an aggregate purchase price of $19,300,000.[62]
- On March 6, 2012, Akamai acquired Cotendo, Inc.,[61] for an aggregate purchase price of $278,900,000.[63]
- On September 13, 2012, Akamai acquired FastSoft, Inc.,[61] for an aggregate purchase price of $14,400,000.[64]
- On December 4, 2012, Akamai acquired Verivue, Inc.,[61] for an aggregate purchase price of $30,900,000.[65]
- On November 8, 2013, Akamai acquired Velocius Networks[66] for an aggregate purchase price of $4,300,000.[67]
- In February 2014, Akamai acquired cyber security provider, Prolexic Technologies[66] for an aggregate purchase price of $390,000,000.[68]
- In February 2015, Akamai acquired Xerocole Inc., a domain name system technology company.[69]
- On April 6, 2015, Akamai acquired cloud OTT IPTV service provider Octoshape,[70] for an undisclosed amount.[71]
- On November 2, 2015, Akamai acquired Bloxx, a provider of Secure Web Gateway (SWG) technology,[72] for an undisclosed amount.[73]
- On September 28, 2016, Akamai acquired Concord Systems, a provider of technology for the high performance processing of data at scale,[74] for an undisclosed amount.[75]
- On October 4, 2016, Akamai acquired Soha Systems, an enterprise secure access delivered as a service provider,[76] for an undisclosed amount.[77]
- On December 19, 2016, Akamai acquired Cyberfend, a bot and automation detection solutions provider,[78] for an undisclosed amount.[79]
- On March 29, 2017, Akamai acquired SOASTA, a digital performance management company based in Mountain View, CA, for an undisclosed all-cash amount.[80]
- On October 11, 2017, Akamai acquired Nominum, a carrier-grade DNS and DHCP provider and one of the major players in the creation of the modern DNS system, for an undisclosed all-cash amount.[81]
- In October 2019, Akamai acquired security software provider ChameleonX for $20 million.[82][83]
- On January 24, 2019, Akamai acquired CIAM provider Janrain.[84]
- On October 27, 2020, Akamai acquired IoT and mobile security provider Asavie.[85]

Litigation

One of Akamai's patents covers a method of delivering electronic data using a content delivery network. Internet Web site proprietors (content providers) contract with Akamai to deliver their Web sites' content to individual Internet users. The patented method permits large files, such as video or music files, to be stored on Akamai's servers and accessed from those servers by Internet users. This increases the speed with which Internet users access the content from Web sites.

Unfortunately for Akamai, its patent was written in a way that called for or permitted actions by multiple persons or entities—such as the content provider customer and the company providing the CDN service.[86] **Akamai's competitor Limelight chose to operate its allegedly infringing service in that manner—it performed most steps of the patented process and its customers performed a so-called tagging step. Under the interpretation of patent law at the time when Akamai decided to sue Limelight for patent infringement, a method patent could be held infringed only when a single actor performed all of the steps.** The court therefore overturned a $40 million jury verdict in Akamai's favor.

Akamai initially lost the case, even taking it to the Supreme Court. The Supreme Court returned the case to the United States Court of Appeals for the Federal Circuit, however, with an invitation to re-evaluate its rule, if it chose to do so, that all the steps of a method had to be performed by a single actor for there to be infringement. On remand, the Federal Circuit considered the matter *en banc* (all active judges of the circuit) and modified its rule. It

now held that a patent could also be directly infringed if "an alleged infringer conditions participation in an activity or receipt of a benefit upon performance of a step or steps of a patented method and establishes the manner or timing of that performance." On that basis, the Federal Circuit reinstated the $40 million jury verdict. It said that "Akamai presented substantial evidence demonstrating that Limelight conditions its customers' use of its content delivery network upon its customers' performance of" the steps that Limelight does not itself perform. This has been considered a substantial change in patent law. The case is known as *Akamai Techs., Inc. v. Limelight Networks, Inc.*.

Controversies

The National Security Agency and Federal Bureau of Investigation have reportedly used Facebook's Akamai content delivery network (CDN) to collect information on Facebook users.[87]This report appears to show intelligence analysts intercepting communications between Facebook and its CDN provider, but does not indicate Akamai as being complicit in this process.

According to researchers from the Universities of Cambridge and California-Berkeley, University College London, and International Computer Science Institute-Berkeley, Akamai has been blocking access to web sites for visitors using Tor.[88][89]

PROOF OF CONCEPT Akamai overcomes the Internet's hot spot problem. Paul Sagan says that Danny could leave the company to finish his PhD and publish his thesis, but then they'd have to kill him. Everyone else at Akamai is encouraged to complete their academic work, a slew of them at MIT, but Danny – him […]

[**Paul Lewis Sagan (born 1959)**] says that Danny could leave the company to finish his PhD and publish his thesis, but then they'd have to kill him. Everyone else at Akamai is encouraged to complete their academic work, a slew of them at MIT, but Danny - him they'd have to off. He knows too much.

[**Daniel Mark Lewin (born 1970)**] is an algorithms guy, and at Akamai Technologies, algorithms rule. After years of research, he and his adviser, professor [**Frank Thomson Leighton (born 1956)**], have designed a few that solve one of the direst problems holding back growth of the Internet. This spring, Tom and Danny's seven-month-old company launched a service built on these secret formulas.

The **Akamai** solution recalls great historical shifts - discoveries of better, faster ways - like the invention of Arabic numerals, or the development of seafaring. Take the latter: For most of prehistory, people traveled exclusively over land. Then, around 5,000 years ago, they discovered that floating cargo on water was easier than lugging it across terrain - no mountains to climb, no roads to negotiate. Seafaring transformed most of the world's surface from unusable space into a vast ubiquitous shortcut, a portal to faraway lands and great riches. Natural harbors blossomed into sophisticated cities. And although societies continued exchanging goods with their neighbors over land, the first world powers, the first empires, commanded the seas.

In some ways, sending information around the traditional Internet resembles human transport, pre-Phoenicia. The Net was originally designed like a series of roads connecting distinct sources of content. Different servers, physical hardware, specialized in their own individual data domains. As first conceived, an address like nasa.gov would always correspond to dedicated servers located at a NASA facility. When you visited www.ksc.nasa.gov to see a shuttle launch, you connected to NASA's servers at Kennedy Space Center, just as you traveled to Tivoli for travertine marble instead of picking it up at your local port. When you ran a site, your servers and only your servers delivered its content.

This routing system worked fine for years, but as users move to fatter pipes, like DSL and broadband cable, and as event-driven supersites emerge, the protocols tying information to location cause a bottleneck. Back when The Starr Report was posted, Congress' servers couldn't keep up with hungry surfers. When Victoria's Secret ran its Super Bowl ad last February, similar lusts went unsated. The Heaven's Gate site in 1997 quickly followed its cult members into oblivion. And when The Phantom Menace trailers hit the Web this spring, a couple of sites distributing them went down.

This is the "hot spot" problem: When too many people visit a site, the excessive load heats it up like an overloaded circuit and causes a meltdown. Just as something on the Net gets interesting, access to it fails.

For more time-critical applications, the stakes are higher. When the stock market lurches and online traders go berserk, brokerage sites can hardly afford to buckle. In retail, slow responses will send impatient customers clicking over to the competition. Users may have Pentium IIIs and ISDN lines, but when a site can't keep up with demand, they feel like they're on a slow dialup. And users on relatively remote parts of the network - even tech hubs like Singapore - often suffer slow responses, not just during peak traffic.

ISPs address this problem by adding connections, expanding capacity, and running server farms to host client sites on many machines, but this still leaves content clustered in one place on the network. Publishers can mirror sites at multiple hosting companies, helping to spread out traffic, but this means duplicating everything everywhere, even the files no one wants. A third remedy, caching, temporarily stores copies of popular files on servers closer to the user, but out of the original site's control. Naturally, site publishers don't like this - it delivers stale content, preserves errors, and skews usage stats. In other words, massive landlock.

So in 1998, with their new algorithms in hand, [Frank Thomson Leighton (born 1956)] and [Daniel Mark Lewin (born 1970)] found themselves facing a sort of manifest destiny. The Web's largest sites were straining to meet demand - and frequently failing. Most needed better traffic handling, a way to cool down hot spots and speed content delivery overall. And Tom and Danny had conceived a solution, a grand-scale alternative to the Net's routing system.

In September, a California company called Sandpiper Networks introduced a service perilously similar to what they'd envisioned, but Tom and Danny's load-balancing solution was one step more radical, and the problem was plenty big for two contenders. [Paul Lewis Sagan (born 1959)], a content guy from Time Warner's Pathfinder, signed up to lead them, and the Cambridge, Massachusetts-based startup began building its own globe-spanning network of servers that would handle Web content in a brand-new way.

It worked. With Akamai's FreeFlow service, all content pours through the entire network, instantly responding to demand, ebbing and flowing as needed, changing routes and locations in response to current conditions. Its ocean of servers connects to the terra firma of the rest of the Net at scores of ports, all of which move data more quickly as conditions continually change.

No Fixed Address

In January, Akamai began running beta versions of FreeFlow, serving content for ESPN.com, Paramount Pictures, Apple, and other high-volume clients. (Akamai withholds the names of the others, but you can tell if a site is using the service by viewing the page source and looking for akamaitech.net in the URLs. A cursory test reveals "Akamaized" content at Yahoo! and GeoCities.)

ESPN.com and Paramount have been good beta testers - ESPN.com because it requires frequent updates and is sensitive to region as well as time, and Paramount because it delivers a lot of pipe-hogging video. On March 11, while ESPN was covering the first day of NCAA hoops' March Madness, Paramount's Entertainment Tonight Online posted the second Phantom Menace trailer. FreeFlow handled up to 3,000 hits per second for the two sites - 250 million in total, many of them 25-Mbyte downloads of the trailer. But the system never exceeded even 1 percent of its capacity. In fact, as the download frenzy overwhelmed other sites, Akamai picked up the slack. Before long, Akamai became the exclusive distributor of all Phantom Menace QuickTimes, serving both of the official sites, starwars.com and apple.com.

So how does it work? Companies sign up for Akamai's FreeFlow, agreeing to pay according to the amount of their traffic. Then they run a simple utility to modify tags, and the Akamai network takes over. Throughout the site, the system rewrites the URLs of files, changing the links into variables to break the connection between domain and location. On www.apple.com, for example, the link www.apple.com/home/media/menace_640qt4.mov, specifying the 640 x 288 Phantom Menace QuickTime trailer, might be rewritten as a941.akamai.com/7/941/51/256097340036aa/www.apple.com/home/media/menace_640qt4.mov. Under standard protocols, a941.akamaitech.net would refer to a particular machine. But with Akamai's system, the address can resolve to any one of hundreds of servers, depending on current conditions and where you are on the Net. And it can resolve a different way for someone else - or even for you, a few seconds later. (The /7/941/51/256097340036aa in the URL is a fingerprint string used for authentication.) This new method is more complicated, but like modern navigation, it opens new vistas of capacity and commerce.

Sandpiper remains Akamai's only direct competitor. In April it signed a deal with AOL and Inktomi to begin serving their sites and incorporating their servers into the Sandpiper network. But a month out of the starting gate, Akamai was running immediately neck and neck with its rival, both promising more than 1,000 servers by the end of the year.

Academic Hot Spot

Partly because it arrived second, Akamai has had to differentiate its product. The company has done this not only by focusing on fine points of the technology, but also by positioning itself as the intelligent solution. FreeFlow is the masterwork of leading scientists from MIT.

What's more, the scientists of Akamai are algorithms people. Whereas network hackers tend to be masters of improvisation, spotting local problems and using intuition and quick experimentation to fire off fixes, algorithms people tend to be slower and more rigorous, examining and proving everything along the way. They start with the most pared-down problems - sorting numbers, stacking rectangles, connecting dots - and build up to more complicated situations. They study how efficiently computer programs run under all conditions - the best, average, and worst-possible cases - as the mass of processors, connections, and information become infinitely large. It may take them a while to find a solution they like, but when they do, they know it will work, both on paper and in any reality.

This is the hot spot phenomenon: just as something on the Net gets interesting, access to it fails.

So network growth doesn't scare algorithms people; they always push things to infinity anyway.

You can trace Akamai's genesis to LCS, MIT's Laboratory for Computer Science, where **Tim Berners-Lee's World Wide Web Consortium** and [Frank Thomson Leighton (born 1956)]'s algorithms group both have their offices. In 1995 Tim asked Tom if he thought distributed algorithms could reliably solve the hot spot problem, and Tom's algorithms posse was intrigued. The problem raised interesting theoretical issues, the group's forte, while at the same time the graphs of nodes and edges they drew on whiteboards represented actual machines and Net connections. Real-world relevance! Several semesters and ideas later - some published, some still proprietary - Tom and Danny had blueprints for server software that would cool down traffic everywhere. But better, they had formally proven that most of their algorithms were optimal. In other words, different solutions might give equally good results, but none could ever possibly do better.

For their nonoptimal algorithms, Tom and Danny demonstrated that the problems were, in computer-science shorthand, "hard" problems. This means there are no major shortcuts to finding the best solution; the problem is inherently difficult, and you just have to do the best you can with finite time and computational resources.

Lastly, Tom and Danny knew with total certainty that, given their descriptions of the hot spot problem and the workings of the Net, the larger the network grew, the better their solution would perform. They not only had a solution, they had a solution that was literally - demonstrably - unbeatable.

La Sauce Est Tout

The name Akamai means "clever" in Hawaiian, or more colloquially, "cool." At Danny's suggestion, the team found it by trying out words in an online English-Hawaiian dictionary. In a sense, FreeFlow is an attempt to put smartness into the Web page, the URL, and the network itself.

Although at first Akamai's founders imagined selling their traffic-calming solution as server software - ISPs would buy it and install it themselves to boost

Although at first Akamai's founders imagined selling their traffic-calming solution as server software - ISPs would buy it and install it themselves to boost performance - they soon realized they should be a service for publishers, content providers, and ecommerce companies of all kinds, not a software company. With Akamai's service, publishers could forget about servers and ISPs, and concentrate on content. Akamai would run its software on its own broadly deployed server network and sell guaranteed fast delivery, subscription style. The idea was to work with as many ISPs as possible to create a new layer of infrastructure on top of the Net, a fluid system that would run everywhere and reach out to remote populations.

Small ISPs operate at a single location; the big ones have their own subnetworks encompassing multiple POPs in different locations. Both are basically facilities where a bunch of servers share one or more network connections. Akamai calls these facilities "regions," and to get close to all users, the company tries to locate its servers in as many regions as it can. Singapore's SingNet has Akamai servers in its single region, while Teleglobe has them all over. Partnering ISPs small and large benefit from improved capacity, while their users get faster delivery of FreeFlow sites. (The company targets content providers and ecommerce sites, but hopes to cultivate an Intel-style status among consumers as well, who would look for ISPs with "Akamai Inside.")

So Akamai servers are in diaspora, but they remain clannish. They keep in constant contact with each other all over the map, speaking their own special dialect of Linux. Each region has one mapping server and one or more content servers. All content servers, no matter where they are, are eligible to serve any content. The mapping servers monitor the local state of the network: How fast are the current connections to neighboring regions? Which connections seem to have gone down completely? They figure out which servers should carry which files, and then how to evenly distribute the hits for a requested file among the servers that carry it.

Web pages themselves break down into units: the HTML page plus each embedded file it contains - images, animations, sounds, video. Akamai's system wisely leaves the HTML alone and scatters only the embedded elements, the rationale being that these larger files cause the traffic jams, while plain HTML is fast and cheap. In a big cafeteria, FreeFlow might pick up your meat loaf, green beans, and rice pudding at three different counters, calculating which steam tables look hotter and where the lines are long. But your tray, the HTML, always comes from the same place. Keeping the HTML on the home server also keeps the user database and customization scripts in one place, where publishers want them.

When a user requests a file, the mapping servers decide on a content server in two stages: They choose first the best region and then the content server within that region. In computer-science terms, the first stage represents a classic "min-cost" flow problem, where the cost associated with each hop between neighboring regions - or how easy it is for traffic to flow between them - is weighted. As traffic conditions change, the mapping servers update these weights and continually find a low-cost route based on a user's place on the network. As Akamai and Sandpiper both know, this is an expensive, "hard" calculation. The mapping servers have to be fast.

Within a region, for the second stage of routing, the system divides the traffic evenly among all the servers using "consistent hashing," a wonderful double-randomized hashing algorithm that Danny invented, earning him MIT's 1998 Morris Joseph Lewin Award (no relation) for best master's thesis. Simple hashing algorithms, which assign objects to locations the way a card dealer deals out hands, break down completely when players drop out or come in; the original formula for who will receive what card, which relies on knowing the number of players, no longer works. But consistent hashing splits up and mixes the assignments so thoroughly, while still using a fairly simple formula, that if locations drop out and throw things off, the correct location will still be close by. As more server problems and network glitches arise, the algorithm has to do more second-guessing, but it achieves the best results possible in an unsteady environment.

Routing and spreading the hits intelligently is important, but it isn't the whole solution. The real hot spot cooler is balancing the content load - determining which servers should have which files in the first place, before they fulfill requests routed to them. Akamai's solution replicates the popular files on multiple servers, spreads total loads evenly, and minimizes copying files around. The ingenious algorithm underlying this process is Akamai's secret sauce, and as the French say, the sauce is everything.

It was a solution that was literally - demonstrably - unbeatable.

Cambridge Dons

Underlying algorithms aside, a private network service business is a different beast entirely from a software business - for one thing, it requires far more money.

Discovered by Battery Ventures through MIT's student-run "$50K" Entrepreneurship Competition (the Akamai team failed to win the trial's whopping $50,000 grant for starting a new business, though the winner turned out virtuous and offered to split the take with the four other finalists), Akamai later secured funding from several angel investors. Among them were Gil Friesen (formerly of Classic Sports) and Art Bilger (formerly of Apollo Fund and New World Communications). Polaris Venture Partners of Boston and Seattle also joined, and by the end of 1998 the startup had more than $8 million in first-round funding.

The talent snowballed. Battery Ventures' Todd Dagres recruited [Paul Lewis Sagan (born 1959)] as chief operating officer last January. In March David Goodtree joined as head of marketing, after years of studying the IT industry at Forrester Research. In April [George Henry Conrades (born 1939)] became Akamai's CEO and chair. **At BBN George had overseen the acquisition of Genuity, authors of the traffic-management software tool Hopscotch, and when he learned about Akamai, it seemed the perfect big-thinking, out-of-the-box idea: a Hopscotch for the entire Internet. Everyone believed.**

Today Akamai employs about 130 people. Many are MIT students, both graduate and undergrad. But alongside them in the trenches is a surprising number of actual faculty on temporary leave - full professors and associate professors from places like MIT, Carnegie Mellon, and UC Berkeley.

The Sandpiper Approach

Akamai and Sandpiper are not the first in their field of distributed traffic management. Older systems, many still available and useful, perform sophisticated routing and load balancing over groups of servers installed on a single subnetwork. Companies like Cisco (DistributedDirector), GTE Internetworking (which acquired BBN and with it Genuity's Hopscotch), and Resonate (Central Dispatch) have been selling such solutions as installable software or hardware. Digex and GTE Internetworking (Web Advantage) offer hosting that uses intelligent load balancing and routing within a single ISP. These work like Akamai's and Sandpiper's services, but with a narrower focus.

But only Akamai and Sandpiper are selling the service of whole server networks spanning numerous ISPs, and only Akamai and Sandpiper use the trick of rewriting URLs as a hook into the alternative system.

Both companies' services are powerful, but they're not identical. Footprint customers specify which part of their content the system should handle by defining rules through a user interface, rather than by adding tag lines to page source. Sites project expected traffic levels ahead of time and pay for levels of

service, rather than paying by the meter.

Footprint users can choose from many content distribution options - some simple, some advanced - for different parts of a site, while FreeFlow optimizes everything automatically. Footprint also distributes HTML, not just embedded files, spreading database information through the network. Akamai leaves HTML at home.

Under unusual circumstances, Footprint may be less bulletproof than FreeFlow, but it has proven itself well. It kept The Starr Report available on the Los Angeles Times site, when many others buckled, and served Intuit's site reliably all through tax season. As long as speed is scarce on the Net, the two companies are going to find fans.

Both companies, if they continue to grow, will route traffic more efficiently over the Net as a whole, increasing delivery speeds for subscribers and nonsubscribers as well. But there's a downside. Content delivered via these subscription-based networks will make content routed by the old, free Internet seem slow. A page that loads in six seconds seems fine until you visit one that loads in four. This effect will be magnified as people upgrade their connections to DSL and broadband cable. With fatter pipes, users will demand more information-intensive experiences, and the newly available last-mile bandwidth will be filled up with fast, dazzling content from supersites, served from networks like Akamai. ESPN.com will appear instantly, but you'll have to wait an age for anything homegrown or poorly financed.

Others argue, however, that the Internet is already a tiered environment, where cash-rich content providers can add more and more hardware to improve delivery, while your cousin's homepage, with no traffic management resources behind it, is already slow. Akamai and Sandpiper just allow more publishers to tap into premium services.

Either way you look at it, the stakes are high. The winner, if there is one, will have its hand in the major revenue-generating sites on the Web. More than any other company in the medium's short history, the winner will own the Net - or at least the parts of it that pay.

Sea Change

Akamaiians compare their company to FedEx, delivering content faster and more reliably than the old USPS. It's not a bad comparison - as good, at least, as the glorious advent of sea travel thousands of years before Christ - but it raises the specter of huge capital needs and about 10 more years till ubiquity.

Akamai wants to be everywhere: says Paul, "a server in every POP."

Yet in less than a year, the little-known company is well on its way toward global domination. Akamai wants to be universal, as widespread as the Net itself, with, in Paul's terms, "a server in every POP." If the company has its way, every computer on the Net will connect to Akamai servers, which will push and pull content around with the tides, constantly running calculations on the turbulence and fluid dynamics of information. As each new site and ISP signs on, Akamai's ocean will swell, carrying ships ever closer to their final goals. For now at least, the ordinary user ought to be glad that the company in charge of the Earth's oceans wants only to give each of us beachfront property.

2000 (April) - whitepaper on FreeFlow

http://www.theether.org/cs199/papers/freeflow.pdf

2000 (April 17) - NYTimes - "TECHNOLOGY; 2 Companies Take Separate Paths To Speed Delivery of Web Pages"

By Lawrence M. Fisher / April 17, 2000 - Source - [HN01F7][GDrive]

Here's news: Some of the Internet's uncertainties have nothing to do with stock prices. Take the vagaries of surfing the Web, for example.

Anyone who has ever watched a complex Web page paint itself onto the computer screen, image by grudgingly slow image, can attest that the World Wide Web should be faster. On that simple proposition there is virtually unanimous agreement.

Where there is disagreement is over how to accomplish this worthy goal -- and how to get paid for doing it. On that, the Web-performance industry splits into two factions, whose leaders are divided by technologies and an entire continent: Inktomi, based in Foster City, Calif., and Akamai, in Cambridge, Mass.

Inktomi, with America Online as a trophy customer, aims to make Web traffic flow faster by storing or "caching" the most frequently requested material on network server computers nearest to the people who request it. Last year, for example, when a bazillion or so AOL users clicked on the Starr report, there were no delays or crashes. That is because the readers were not linking to the government server, but to a battalion of Inktomi caches that duplicated and delivered the document.

Akamai, which counts Yahoo among its big clients, takes a different approach to the same problem, with a technique called content distribution. When a user

in Singapore, say, clicks on a popular page in Yahoo, only the first request goes to Yahoo's server in Palo Alto, Calif.; the balance of the page is then delivered from an Akamai server with the shortest, fastest connection to the person in Singapore.

Inktomi and Akamai each have a pack of competitors, snapping at their heels and hoping to bite off bigger and bigger chunks of the Web-performance market, which is expected to grow from about $4.5 billion last year to $25 billion in 2003, according to Andrew C. Brosseau, an analyst with S. G. Cowen.

Officially, Inktomi and Akamai executives assert that they really do not compete with each other and have little in common -- which of course means they compete vigorously and have more in common than either will let on.

"Akamai is just doing one of a multitude of things you would want to do to interact with content," said David C. Peterschmidt, president and chief executive of Inktomi, whose stock price is up nearly 14 percent so far this year, despite the market's recent turmoil. "Caching allows a whole set of stuff, of which content distribution is just one thing."

But as Akamai sees things, "there's a lot of content that's uncacheable, because caching doesn't ensure freshness," said [Paul Lewis Sagan (born 1959)], Akamai's president and chief operating officer. "In entertainment or news you have to make sure the content is fresh for each user." Akamai's stock price, despite a plunge from the stratospheric heights it occupied in January, is still up nearly 150 percent from the offering price last October.

Whatever their technical differences, Akamai and Inktomi in some ways have followed remarkably parallel paths. Each, for instance, has an odd name derived from a Native American language: Inktomi, pronounced INK-tuh-mee, is the name of a clever spider in Lakota legend; Akamai (AK-uh-migh) is Hawaiian for intelligent.

Each was founded by a pair of math whizzes from a leading university, but is now managed by a computer industry graybeard.

Each company, moreover, received venture funding from a leading technology company, Intel in Inktomi's case, Apple Computer and Cisco Systems in Akamai's. And each has ridden an initial public offering into a high stock market valuation for the company -- $100.8125 a share for Inktomi and $64.875 a share for Akamai.

And each, of course, tries to address perhaps the most vexing quirk of the Web. Some sites sprint while others crawl. But sometimes a site will sprint on one visit only to crawl on the next. In such cases the disparity is more likely caused not by the Web site itself, but by the underlying architecture of the Internet, which was originally intended to deliver e-mail reliably -- not to broadcast complex media at high speed.

For a user, calling on any Web page requires downloading multiple "objects" -- a banner ad, a photo or a set of activity buttons, for example. Any or all such objects must be broken down into packets of digital bits, sent across the Internet and reassembled at the end user's computer.

During this downloading, even for the delivery of a single Web page, there is a tremendous amount of dialogue between the user's browser software and the source computer server. All the communicating bits must travel -- often across the country, or even around the globe -- hopping across multiple networks and traffic routers. At each hop, a few packets may get lost and have to be resent.

Inktomi's approach, caching, and Akamai's mainstay, content distribution, both seek to streamline things by taking the material on the original server and moving it closer to the user. But the approaches differ, as do the trade-offs.

The concept of caching comes from the semiconductor industry; chip makers commonly put a small amount of memory, called cache, directly on a microprocessor. Frequently used bits of data can be stored in this cache memory, to be easily summoned when needed, speeding the computer's operation

Inktomi has a software product, called Traffic Server, that runs on server computers around the Internet, working essentially the same way as cache memory on a computer chip. Traffic Server monitors network traffic to identify the most frequently requested objects, then stores, or caches, them closer to the requesting users.

"Networks were very dumb," Mr. Peterschmidt said. "They would send the same packet over and over again to the same location. Traffic Server was the first step at making the network smarter. It would recognize that you'd already requested that information, and store it closer to the user."

At age 52, Mr. Peterschmidt, formerly president of Sybase, the database software company, is Inktomi's graybeard. The company was founded in 1996 by two researchers at the University of California at Berkeley: Eric A. Brewer, now 33 and Inktomi's chief scientist, and Paul Gauthier, who is 27 and currently on sabbatical from the company. Their first product was a search engine, which Inktomi still sells as a service to portals like Yahoo and Hotbot.

Traffic Server, introduced in 1998, was created as a stand-alone software package to run on Sun Microsystems' Solaris version of the Unix operating system. The product now also runs on other major versions of Unix and on Microsoft's Windows NT network operating system. Inktomi also publishes Traffic Server's application programming interfaces, or A.P.I.'s -- software specifications that enable other companies to add functions, like network security or so-called streaming audio and video.

Excite@Home, which became Inktomi's second customer for Traffic Server after AOL, uses Traffic Server's programming capability to customize the Excite@Home Web service for different devices -- one version for PC's, for example, another for TV set-top boxes. But while this flexibility was nice, the real draw was the improved performance, said Robert Keller, an engineering manager at Excite@Home.

Inktomi, which counts 200 customers, sells Traffic Server for as much as $24,000 a copy. And it requires a substantial piece of hardware, like a Sun Sparc server, which is likely to cost as much or more. These requisites have left an opening at the budget-minded end of the market.

Rushing to fill this opening are companies like CacheFlow and NetAppliance, which sell caching appliances -- small computers preloaded with caching software. Novell, the office-network software company, is also a player in this end of the cache market. The company has deals with 13 major server manufacturers, including I.B.M., Compaq and Dell, to sell hardware bundled with software. Prices start as low as $4,000.

CacheFlow, whose stock went public last November at $24 and now trades at $34.25, says it will do for caching what Cisco Systems did for routing -- even though Cisco has its own cache products. CacheFlow offers a simple hardware box with its own operating system and software that is designed to require little of the Web operator's time or effort.

"We go out, do the installation and the customer never has to think about us," said Brian M. NeSmith, president and chief executive of CacheFlow, based in Sunnyvale, Calif.

All of the cache vendors sell a product, be it hardware, software or a mixture of both**. Akamai, on the other hand, sells a service, typically priced on a megabit-per-month basis.**

megabit per month basis.

Akamai customers -- which include the Web sites of Apple Computer, CBS, Microsoft and The New York Times -- must first run a small program that selectively ''akamaizes'' portions of their sites for delivering material over Akamai's servers. This process, one that the individual user normally would not be aware of, takes the U.R.L., or address, that normally directs a browser request to the server housing the information and converts the address to an A.R.L., the designator for an Akamai server.

The 2,750 or so Akamai servers worldwide are run for the company by network operators like [UUNET Technologies, Incorporated] and Sprint. Akamai's software determines which server is best suited for use by the person making the request and then sends the ''akamaized'' content to that server. Akamai officials contend that the process is much more sophisticated than caching.

''Caching is 2 percent of the complexity of content delivery,'' said [**Daniel Mark Lewin (born 1970)**] , who was a graduate student at the Massachusetts Institute of Technology when he co-founded Akamai in 1998 with [**Frank Thomson Leighton (born 1956)**], a professor of applied mathematics there. ''The hard part of content delivery is figuring out what request should go to what machine,'' said Mr. Lewin, 29, who is now Akamai's chief technology officer.

In addition to Akamai's president, **Mr. Sagan, who is 41 and is a former president of Time Inc.** New Media, Akamai's executive suite includes [**George Henry Conrades (born 1939)**], chairman and chief executive. Mr. Conrades, 61, is the former chief executive of the networking company BBN, now Genuity, and a former senior executive at I.B.M.

Some analysts say Akamai overstates the distinctions between content distribution and caching, which they say is also a big part of Akamai's service. ''Akamai deployed $4 million worth of caches and accelerated Yahoo's performance,'' said Peter Christy, an analyst with Jupiter Communications. ''Any of the caching companies could have done that.''

Although he concedes that Akamai has some truly innovative technology, Mr. Christy said the company's real brilliance lay in its business model, which might be described as caching plus network management, all sold as a pay-as-you-go service.

Mr. Christy says Akamai's pitch, that it can improve performance for content providers, has more sizzle than Inktomi's claim that it can reduce costs for Internet service providers. ''None of Inktomi's customers can figure out how to get a consumer to pay more for higher performance,'' he said. Akamai asks content providers, ''Are you willing to pay to have your site perceived better by the consumer?'' he said, ''and the answer is yes.''

Akamai's service is now used by more than 400 Web customers. But the company is challenged by a pack of players, like Adero, Digital Island and Exodus, that act as network hosts for companies that operate Web sites and that have all formed partnerships with Inktomi.

Some of Akamai's potential rivals are even more daunting, like mighty Intel, which started its own Web-hosting business last year and has begun selling Inktomi's software with an Intel cache server.

What is more, many of these hosting companies own their own networks. Akamai does not, instead piggybacking on network carrying capacity from UUNet, Sprint and others.

''Akamai has content distribution, which is good, but that's just one piece,'' said Ruann Ernst, chairman and chief executive of Digital Island, a company in San Francisco that went public last June at $10 and whose stock closed on Friday at $25.875. Its notable customers include CNBC.com, Intuit and The Los Angeles Times.

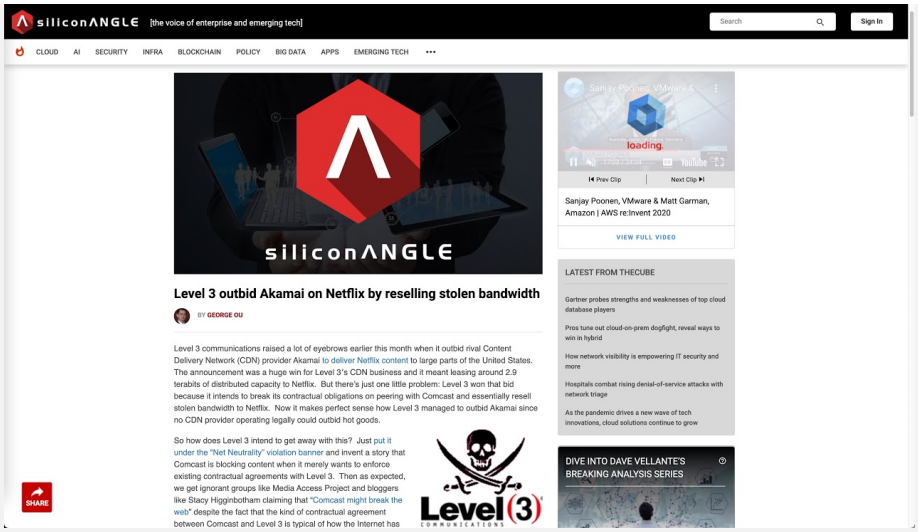
''We are especially good at putting it all together in an integrated way so they don't all look like different solutions,'' Ms. Ernst said. ''It's a huge market, and there will be room for a lot of different business models because different customers will want to buy in different ways.''

2020 (Nov 30) - Silicon Angle - "Level 3 outbid Akamai on Netflix by reselling stolen bandwidth"

Source - [HW005J][GDrive]

2010-11-30-siliconangle-com-level-3-outbid-akamai-on-netflix-by-reselling-stolen-bandwidth

BY GEORGE OU



[HW005K][GDrive]

Level 3 communications raised a lot of eyebrows earlier this month when it outbid rival Content Delivery Network (CDN) provider Akamai to deliver Netflix content to large parts of the United States. The announcement was a huge win for Level 3's CDN business and it meant leasing around 2.9 terabits of distributed capacity to Netflix. But there's just one little problem: Level 3 won that bid because it intends to break its contractual obligations on peering with Comcast and essentially resell stolen bandwidth to Netflix. Now it makes perfect sense how Level 3 managed to outbid Akamai since no CDN provider operating legally could outbid hot goods.

So how does Level 3 intend to get away with this? Just put it under the "Net Neutrality" violation banner and invent a story that Comcast is blocking content when it merely wants to enforce existing contractual agreements with Level 3. Then as expected, we get ignorant groups like Media Access Project and bloggers like Stacy Higginbotham claiming that "Comcast might break the web" despite the fact that the kind of contractual agreement between Comcast and Level 3 is typical of how the Internet has always worked. On the contrary, allowing Level 3 to violate their peering agreement under the banner of "Net Neutrality" is what would actually break the Internet and turn peering and Internet investment economics on its head.

What makes the Internet work

The Internet is comprised of privately built and privately operated networks that connect on a contractual basis. These contracts are mutually agreed upon and there are generally two types of contractual agreements.

1. **Transit agreements**
2. **Peering agreements**

A transit agreements is when a network carrier delivers data between two other networks, and both end point networks have to pay the central carrier to carry that traffic at a metered rate. So if Comcast and Level 3 communications had no direct method of connecting to each other, they must each pay a third party network carrier to connect their two networks. Transit agreements are usually more expensive than peering agreements for every packet delivered and they're generally slower because of distance and congestion. According to DrPeering.net, typical Internet transit rates are $3 to $10 per Megabit per second (Mbps) per month for server bandwidth.

Peering agreements occur when two networks have a direct physical connection to each other. A physical connection exists when it is financially feasible and when there is a business agreement in place. Physical connections are often practical to construct since many end point networks meet at Internet Exchange Points within the same physical building and that merely involves connecting a few in-building Ethernet cables on some gigabit or multi-gigabit switched ports. The business agreement requires that both parties come to mutually agreed upon terms on a financial settlement scheme.

The settlement scheme can involve a fee based agreement or it might involve no money changing hands. When one network sends more traffic to another network than it receives, it usually has to pay a metered fee on the extra traffic that it sends. When the two networks are more or less sending the same amounts of traffic to each other, the two networks can agree on settlement free terms where no money changes hands. These terms of settlement might sound arbitrary and unfair to outside observers that smacks of "might makes right", but it is based on sound economics that ensures continued investment in the Internet.

The network sending more traffic does so because it has cheaper-to-serve customers than the network receiving more traffic. The network receives more traffic because it has more "eyeballs" i.e., broadband consumers who are hundreds of times more expensive to connect than the sending network's customers which are the Netflix and YouTubes of the world. Providing a gigabit per second (Gbps) of capacity to a server in a data center might cost a few hundred dollars of capital expenditures but an additional gigabit of last-mile broadband capacity could cost millions in capital expenditures. Another example of one network that might charge another network to peer is when one network operates more long distance lines which are more expensive to build and maintain, especially those going under the oceans connecting continents.

A network that didn't build the expensive infrastructure can't just expect to use those networks without paying to use them. The network that spent all the money up front in capital expenditures provides value to the network that spent little money building the network and it needs to recoup its costs by charging the network that didn't build the most expensive part of the network. Settlement based peering is the mechanism than ensures that all players on the Internet pay their share of expanding the Internet. This is the only way to ensure continued private investment and growth on the Internet.

How Level 3 intends to steal bandwidth from Comcast

Before Level 3 Communications landed the Netflix CDN deal, it sent approximately the same amount of traffic to Comcast as it received. Because of that, the two networks exchanged services of roughly equal value and they agreed to a settlement free peering contract. The two companies agreed not to charge each other for peering connectivity so long as the traffic exchange levels remained more or less the same

charge each other for peering connectivity so long as the traffic exchange levels remained more or less the same.

But with the massive new Netflix CDN deal where Netflix is currently the largest source of traffic in North America, Level 3 will likely start sending 5 times more traffic to Comcast than it receives. That would violate its current settlement free peering agreement and it would require a new fee based agreement where Level 3 has to pay Comcast for the extra traffic it sends to Comcast. That makes sense as Netflix's old CDN provider Akamai paid to peer with Comcast, but Level 3 decided that it would simply insist on violating its existing free peering agreement with Comcast which would allow it to outbid Akamai on the lucrative Netflix CDN service. Level 3 would essentially steal bandwidth from Comcast to outbid Akamai which pays Comcast for bandwidth.

From Comcast's perspective, this impacts them severely as they're losing bandwidth revenue from Akamai since Akamai lost Netflix business to Level 3, but Level 3 will refuse to pay for the bandwidth they use from Comcast by free riding on their existing peering connection. Even without the bogus Net Neutrality claims, Level 3 can cause major problems for Comcast if a peering dispute turns ugly. If Comcast insists on enforcing its contractual agreement and charges Level 3 and Level 3 refuses to pay, there's little Comcast can do about it other than to sever the peering connection and send Level 3 traffic to its Internet transit provider that will eventually reach Level 3. But with most peering disputes, the contract violator will simply refuse to return to the Internet transit path and they'll keep sending traffic down a broken unpaid pipe to Comcast which breaks network connectivity between Level 3 and Comcast completely.

Each will point the finger while customers on the two networks are cut off from each other and it makes both providers look bad. The reputation of both companies will be harmed and it will essentially be a game of "chicken" to see who blinks first. For smaller peering disputes that don't garner much attention, the dispute is settled in a court or arbitration while the network is cut off for days or weeks. For larger peering disputes that receive media attention and congressional attention because fuming voters are calling their representatives and senators, it turns ugly and may lead to calls for additional Internet regulations which no one on the Internet wants.

With the added confusion of "Net Neutrality", the hopeless pro-anything-labeled-Net-Neutrality biased blogosphere and the FCC proceedings on the Comcast NBC merger, Level 3 figured that they had a good chance of getting away with bandwidth theft or at least forcing much more favorable rates from Comcast. But not only is Level 3 trying to steal bandwidth, they're a hypocrite because they've fought just as vigorously against other bandwidth thieves that tried to violate Level 3's peering agreements. Joe Waz of Comcast pointed this out by citing Level 3's own words when it came to the sanctity of peering agreements.

"To be lasting, business relationships should be mutually beneficial. In cases where the benefit we receive is in line with the benefit we deliver, we will exchange traffic on a settlement-free basis. Contrary to [other ISPs] public statements, reasonable, balanced, and mutually beneficial agreements for the exchange of traffic do not represent a threat to the Internet. They don't represent a threat to anyone other than those trying to get a free ride on someone else's network."

Of course Level 3 wasn't actually being genuine when they said that. They only meant it when someone else tried to free ride on Level 3's network but they think it's just fine if they free ride and steal bandwidth from Comcast.

A possible solution to free riders

I think there might be a better solution than severing a peering connection that goes unpaid. What Comcast or any other network encountering a free rider should do is simply enforce a symmetric rate on their peering connection. If Comcast sends 1 Gbps of traffic to Level 3 Communications, then they should enforce a 1 Gbps settlement free receive rate from Level 3. This might result in Level 3 failing to deliver the performance they promised to Netflix. If Level 3 can't deliver an adequate service level to Netflix because they refuse to pay for the extra traffic going to Comcast, then Netflix is well within its rights to terminate the new agreement with Level 3 and return to honest CDN providers like Akamai. From a Net Neutrality standpoint, Comcast would not be discriminating against any source or application type in particular and they would only be enforcing existing contractual agreements with Level 3.

Harold Melvin Agnew (born 1921)

Wikipedia Harold Agnew

See Wikipedia capture : [HK000P][GDrive]

Harold Melvin Agnew (March 28, 1921 – September 29, 2013) was an American physicist, best known for having flown as a scientific observer on the Hiroshima bombing mission and, later, as the third director of the Los Alamos National Laboratory.

Agnew joined the Metallurgical Laboratory at the University of Chicago in 1942, and helped build the Chicago Pile-1, the world's first nuclear reactor. In 1943, he joined the Los Alamos Laboratory, where he worked with the Cockcroft–Walton generator. After the war ended, he returned to the University of Chicago, where he completed his graduate work under Enrico Fermi.

Agnew returned to Los Alamos in 1949, and worked on the Castle Bravo nuclear test at Bikini Atoll in 1954. He became head of the Weapon Nuclear Engineering Division in 1964. He also served as a Democratic New Mexico State Senator from 1955 to 1961, and was the Scientific Adviser to the NATO Supreme Allied Commander Europe (SACEUR) from 1961 to 1964. He was director of the Los Alamos National Laboratory from 1970 to 1979, when he resigned to become President and Chief Executive Officer of General Atomics. He died at his home in Solana Beach, California, on September 29, 2013.

Early life and education

Harold Melvin Agnew was born in Denver, Colorado on March 28, 1921, the only child of a pair of stonecutters. He attended South Denver High School and entered the University of Denver, where he majored in chemistry. He was a strong athlete who pitched for the university softball that won a championship. He left the University of Denver in January 1942, but had enough credits to graduate Phi Beta Kappa with his Bachelor of Arts degree in June, and he received a scholarship to Yale University.[1][2]

After the Japanese bombing of Pearl Harbor brought the United States into the Pacific War, Agnew and his girlfriend Beverly, a fellow graduate of South Denver High School and the University of Denver, attempted to join the United States Army Air Corps together. They were persuaded not to sign the enlistment papers. Instead, Joyce C. Stearns, the head of the physics department at the University of Denver, persuaded Agnew to come with him to the University of Chicago, where Stearns became the deputy head of the Metallurgical Laboratory. Although Agnew had enough credits to graduate, Beverly did not and had to remain behind. They were married in Denver on May 2, 1942. They then went to Chicago, where Beverly became a secretary to Richard L. Doan, then head of the Metallurgical Laboratory. Agnew and Beverly had two children, a daughter Nancy, and a son, John.[1][3]

Harold Agnew on Tinian in 1945, carrying the plutoniumcore of the Nagasaki Fat Manbomb

At the Metallurgical Laboratory, Agnew worked with Enrico Fermi, Walter Zinn and Herbert L. Anderson.[1] There, he was involved in the construction of Chicago Pile-1. Initially, Agnew worked with the instrumentation. The Geiger counters were calibrated using a radon-beryllium source, and Agnew received too high a dose of radiation. He was then put to work stacking the graphitebricks that were the reactor's neutron moderator. He witnessed the first controlled nuclear chain reaction when the reactor went critical on December 2, 1942.[4][2][5]

Agnew and Beverly moved to the Los Alamos Laboratory in March 1943.[2] Agnew, Beverly and Bernard Waldman first went to the University of Illinois, where the men disassembled the Cockcroft–Walton generator and particle accelerator while Beverly catalogued all the parts. The parts were shipped to New Mexico, where Agnew and Beverly met up with them, and rode the trucks hauling them to the Los Alamos Laboratory. There, Beverly worked as a secretary, initially with Robert Oppenheimer and his secretary Priscilla Green. She then became secretary to Robert Bacher, the head of Physics (P) Division, and later the Gadget (G) Division, for the rest of the war. Agnew's job was to reassemble the accelerator, which was then used for experiments by John Manley's group.[3][6]

When experimental work wound down, Agnew was transferred to Project Alberta, working as part of Luis W. Alvarez's group, whose role was to monitor the yield of nuclear explosions. With Alvarez and Lawrence H. Johnston, Agnew had devised a method for measuring the yield of the nuclear blast by dropping pressure gauges on parachutes and telemetering the readings back to the plane.[7] In June 1945, he was issued with an Army uniform and dog tags at Wendover Army Air Field, Utah, and was flown to Tinian in the Western Pacific in a C-54 of the 509th Composite Group. Agnew's first task was to install his yield measurement instrumentation in the Boeing B-29 Superfortress aircraft *The Great Artiste*.[8]

During the atomic bombing of Hiroshima, on August 6, 1945, Agnew, along with Alvarez and Johnston, flew as a scientific observer in *The Great Artiste*, piloted by Charles Sweeney, which tailed the *Enola Gay* as the instrumentation aircraft. Agnew later recalled, "After we dropped our gauges I remember we made a sharp turn to the right so that we would not get caught in the blast – but we still got badly shaken up by it." He brought along a movie camera and took the only existing movies of the Hiroshima event as seen from the air.[7][9][10]

After the war ended, Agnew entered the University of Chicago, where he completed his graduate work under Fermi. Agnew and Beverly stayed with Fermi

and his family, due to the post-war housing shortage.[6] He received his Master of Science (MS) degree in 1948 and his Doctor of Philosophy (PhD) degree in 1949,[11] writing his thesis on "The beta-spectra of Cs137, Y91, Pm147, Ru106, Sm151, P32, Tm170".[12] Fellow postgraduate students at Chicago at the time included Tsung-Dao Lee, Chen Ning Yang, Owen Chamberlain and Jack Steinberger.[11]

Los Alamos years

Harold Agnew receives his 30 years of service award in 1974

With his doctorate in hand, Agnew returned to Los Alamos as a National Research Foundation Fellow, and worked on weapons development in the Physics Division.[10] In 1950, he was assigned to the thermonuclear weapons project, and was project engineer for the Castle Bravonuclear test at Bikini Atoll in 1954.[13][14] He became head of the Weapon Nuclear Engineering Division in 1964.[10]

Agnew served as a Democratic New Mexico State Senator from 1955 to 1961.[15] He was the first state senator to be elected from Los Alamos County. Senators served unpaid, receiving only a per diem allowance of five dollars.[16] Since the New Mexico legislature convened for only 30 days in even numbered years and 60 days in odd numbered years,[17] he was able to continue working at Los Alamos, taking leave without pay to attend.[16] He attempted to reform New Mexico's liquor laws, which specified a minimum mark-up. He was unsuccessful in 1957, but the law was reformed in 1963.[18]

From 1961 to 1964, he was Scientific Adviser to the NATO Supreme Allied Commander Europe (SACEUR). He also held a number of part-time advisory position with the military over the years. He was a member of the United States Air Force Scientific Advisory Board from 1957 to 1968, and was chairman of the Science Advisory Group of the United States Army's Combat Development Command from 1966 to 1970. He was a member of the Defense Science Board from 1966 to 1970, the Army's Scientific Advisory Panel from 1966 to 1974, and the Army Science Board from 1978 to 1984.[10]

Agnew became director of the Los Alamos National Laboratory in 1970, when it had 7,000 employees.[19] He took over at a time of great change. His predecessor, Norris Bradbury, had rebuilt the laboratory from scratch after the war, and many of the people he had brought in were approaching retirement.[20]Under his directorship, Los Alamos developed an underground test containment program, completed its Meson Physics Facility, acquired the first Cray supercomputer, and trained the first class of International Atomic Energy Agency inspectors.[21] Agnew managed to get the Los Alamos Laboratory responsibility for the development of the W76, used by the Trident I and Trident II Submarine Launched Ballistic Missiles, and the W78 used by the Minuteman III intercontinental ballistic missiles. He was proud of the work with insensitive high explosive that made nuclear weapons safer to handle. Support from the Atomic Energy Commission for reactor development dried up, but during the 1970s energy crisis, the laboratory explored other types of alternative fuels.[20]

Later life

In 1979, Agnew resigned from Los Alamos and became President and Chief Executive Officer of General Atomics, a position he held until 1985.[10] In his letter of resignation to David S. Saxon, the President of the University of California, Agnew wrote that his decision was influenced by "dissatisfaction with University administration policies and a lack of advocacy for the total LASL [Los Alamos Scientific Laboratory] program" and "frustration with what I consider to be a continuing inequitable distribution of defense program funding by the Department of Energy between the LASL and LLL [Lawrence Livermore Laboratory]."[22]

Harold Agnew at The Los Alamos Laboratory in 2006

Agnew chaired the General Advisory Committee of the Arms Control and Disarmament Agency from 1974 to 1978, and served as a White House science councillor from 1982 to 1989. He was a member of NASA's Aerospace Safety Advisory Panel from 1968 to 1974, and from 1978 to 1987. He became an adjunct professor at the University of California, San Diego in 1988. He was the recipient of the E.O. LawrenceAward in 1966, and of the Department of Energy's Enrico Fermi Award in 1978. Along with Hans Bethe, Agnew was the first to receive the Los Alamos National Laboratory Medal. He was a member of the National Academy of Sciences and the National Academy of Engineering.[5][10][23][24]

A proponent of tactical nuclear weapons, Agnew pointed out in 1970 that the Thanh Hoa Bridge in Vietnam required hundreds of sorties to destroy with conventional weapons when a nuclear weapon could have done the job with just one.[25] In a 1977 article for the Bulletin of the Atomic Scientists, Agnew argued that the fusion reactions of neutron bombs could provide "tactical" advantages over conventional fission weapons, especially in countering the "massive armor component possessed by the Eastern bloc." Citing conclusions reached by the Rand Corporation, Agnew argued that without affecting the armor of a tank, the neutrons produced by a fusion blast would penetrate the vehicle and "in a matter of a few tens of minutes to hours kill or make the crew completely ineffective." Because the neutron bomb reduced collateral damage, it could be used in a much more selective fashion than a fission weapon, thereby providing a clear "advantage for the military defender as well as for the nearby non-combatant."[26]

Agnew maintained that no new U.S. nuclear weapon design could be certified without nuclear testing, and that stockpile reliability stewardship without such testing may be problematic.[27] In a 1999 letter to the *Wall Street Journal*, he commented on the significance of allegations of Chinese nuclear espionage. "As long as any nation has a demonstrated nuclear capability and a means of delivering its bombs and warheads, it doesn't really matter whether the warheads are a little smaller or painted a color other than red, white, and blue," he wrote. "I suspect information published in the open by the National [sic.] Resources Defense Councilhas been as useful to other nations as any computer codes they may have received by illegal means."[28]

Beverly died on October 11, 2011.[3] Agnew was diagnosed of chronic lymphocytic leukemia, and died at his home in Solana Beach, California, on September 29, 2013, while watching football on television.[15][19] He was survived by his daughter Nancy and son John.[2] He had arranged to be cremated and his ashes interred with Beverly's at the Guaje Pines Cemetery in Los Alamos.[29]

In a 2005 BBC interview, Agnew stated, "About three-quarters of the U.S. nuclear arsenal was designed under my tutelage at Los Alamos. That is my legacy."[9]

Harold M. Agnew, the last surviving major figure to have been present at the birth of the nuclear age — a physicist who helped build the world's first reactor and atomic bombs, flew on the first atomic strike against Japan, filmed the mushroom cloud, helped perfect the hydrogen bomb and led the Los Alamos National Laboratory at the height of the cold war — died on Sunday at his home in Solana Beach, Calif. He was 92.

He had recently been given a diagnosis of chronic lymphocytic leukemia, his family said.

Dr. Agnew was no giant of discovery, but he was ingenious technically and wielded great influence for decades as a presidential adviser and a gregarious hawk, as restless and unpredictable as the tumultuous age he helped define.

"We did pretty good," he remarked during a 1992 flight between Moscow and Kiev, Ukraine. "We brought a quick end to a devastating war and maintained the peace, and eventually saw democracy prevail. That's something you can hang your hat on."

In a statement, Charlie McMillan, the current director of Los Alamos, the birthplace of the bomb in the mountains of New Mexico, called Dr. Agnew "a national treasure," saying the United States "will be forever in Harold's debt."

Harold Melvin Agnew was born in Denver on March 28, 1921, the only child of a stonecutter of Scotch-Irish heritage. A natural athlete, he pitched his softball team to a Denver championship. He majored in chemistry at Denver University, graduated Phi Beta Kappa in 1942 and won a scholarship to Yale.

But the secret wartime effort to build an atomic bomb intruded on his studies. Early in 1942 he was assigned to Enrico Fermi, the Italian Nobel laureate who was helping to lead the project at the University of Chicago. Dr. Agnew did what he called "grunt work," making scientific measurements and getting a hefty dose of radiation.

Redirected because of the health danger, he helped stack tons of graphite bricks and uranium into a neat pile at a university squash court.

On a blustery Chicago day, Dec. 2, 1942, Dr. Agnew and a few dozen other people gathered to see if the pile could sustain a chain reaction. Recording pens jumped as atoms split in two. The success meant that in theory the human race now had the means to illuminate cities or level them. He was 21.

Dr. Agnew arrived at Los Alamos in March 1943 with his wife, Beverly. The couple shared a bunkhouse with another couple and a man who cooked nothing but Chinese food, even for breakfast. Amid the tall pines and deep canyons, Dr. Agnew helped build and run a particle accelerator whose data helped demonstrate the merits of various bomb designs.

When the world's first nuclear blast lit up the New Mexico desert before dawn on July 16, 1945, Dr. Agnew was already far away, preparing for the bombing of Hiroshima. He was "aching" for the run to Japan, he recalled, because so many friends had died in the war. He autographed the bomb.

On Aug. 6, he boarded a B-29 bomber that accompanied the Enola Gay, which was carrying the bomb code-named Little Boy. Dr. Agnew and two other scientists measured the size of the shock wave and thus the bomb's power.

Afterward, he and his colleagues took turns peering out a small window at the mushroom cloud and the ground damage. Dr. Agnew filmed the devastation with a 16-millimeter Bell & Howell movie camera he had taken along. He was the only person to witness the whole undertaking, from reactor to weapon to Hiroshima.

After the war, he studied with Fermi at Chicago and received his Ph.D. in physics in 1949. Returning to Los Alamos, he joined the hunt for a technical edge over the Soviet Union, which had exploded its own atomic bomb in 1949, surprising the West.

The first hydrogen bomb, tested successfully in 1952, weighed a staggering 65 tons. Dr. Agnew helped perfect lighter H-bombs that were deliverable over long distances.

In the 1960s, as scientific adviser to the supreme allied commander in Europe, he led the development of protective devices for nuclear arms that kept them under tight presidential control.

Returning to Los Alamos, Dr. Agnew was named head of the weapons division, which developed the warhead for the Minuteman intercontinental ballistic missile, among other arms. In 1970, he became director of the lab, with a staff of about 7,000. Meanwhile, political radicals at the University of California, which ran Los Alamos, labeled him a war criminal and tried him in absentia.

In 1978, Dr. Agnew advised President Jimmy Carter against seeking a comprehensive ban on nuclear testing. He argued that such an East-West stoppage would have ended the development of new arms and, more important, reduced confidence in the potency of the existing arsenal. The White House eventually dropped the ban idea.

Upon retiring from Los Alamos, Dr. Agnew sought to encourage the growth of civilian nuclear power. In March 1979, he became president of General Atomics, a San Diego-based maker and developer of innovative reactors.

From 1982 until 1989, he was a science adviser to the White House under President Ronald Reagan. After the cold war, in 1991, he participated in the first meeting between American bomb makers and their Russian counterparts, seeking ways to reduce nuclear arsenals. In 1992, he urged the United States to buy bomb-grade uranium from scrapped Soviet nuclear arms to bolster the shaky Russian economy and reduce the risk of nuclear war, accident and theft. In August of that year, the White House announced a plan to buy at least 500 metric tons of the material in a deal worth several billion dollars.

The Russian bomb uranium was diluted into fuel for nuclear reactors that make electricity, turning a major danger into a peaceful bonanza.

Dr. Agnew is survived by a daughter, Nancy E. Chapman; a son, John; four grandchildren and three great-grandchildren.

He also left a towering reputation at Los Alamos. Late in life, Dr. Agnew noted with pride that cars could occasionally be seen there bearing bright orange bumper stickers reading, "Harold, come back."

Paul Gardner Allen (born 1953)

Wikipedia Paul Allen

special note :

Ebola [edit]

In 2014, Allen pledged at least $100 million toward the fight to end the Ebola virus epidemic in West Africa,[135] making him the largest private donor in the Ebola crisis. He also created a website called TackleEbola.org[136] as a way to spread awareness and serve as a vehicle for donors to fund projects in need. The site additionally highlighted organizations working to stop Ebola that Allen supported such as International Red Cross and Red Crescent Movement, Médecins Sans Frontières, Partners in Health, UNICEF and World Food Program USA. On April 21, 2015, Allen brought together key leaders in the Ebola fight at the Ebola Innovation Summit in San Francisco. The summit aimed to share key learnings and reinforce the need for continued action and support to bring the number of Ebola cases down to zero, which was achieved in January 2016.[137]

In October 2015, the Paul G. Allen Family Foundation announced it would award seven new grants totaling $11 million to prevent future widespread outbreaks of the virus.[138]

Paul Gardner Allen (January 21, 1953 – October 15, 2018) was an American business magnate, investor, and philanthropist. He was best known for co-founding Microsoft Corporation with childhood friend Bill Gates in 1975, which helped spark the microcomputer revolution of the 1970s and 1980s, later making Microsoft the world's largest personal computer software company.[2] Allen was ranked as the 44th-wealthiest person in the world by Forbes in 2018, with an estimated net worth of $20.3 billion at the time of his death.[1][3]

Allen left active operations at Microsoft in early 1983 after a Hodgkin lymphoma diagnosis, remaining on its board as vice chairman. He and his sister, Jody Allen, founded Vulcan Inc. in 1986,[4] a privately held company that managed his various business and philanthropic efforts. He had a multi-billion dollar investment portfolio including technology and media companies, scientific research, real estate holdings, private space flight ventures, and stakes in other sectors. He owned the Seattle Seahawks of the National Football League[5] and the Portland Trail Blazers of the National Basketball Association,[6] and was part-owner of the Seattle Sounders FC of Major League Soccer.[7] In 2000 he resigned from his position on Microsoft's board and assumed the post of senior strategy advisor to the company's management team.

Allen was also the founder of the Allen Institutes for Brain Science,[8] Artificial Intelligence[9] and Cell Science,[10] as well as companies like Stratolaunch Systems[11] and Apex Learning.[12] He gave more than $2 billion to causes such as education, wildlife and environmental conservation, the arts, healthcare, community services and more.[13] In 2004, he funded the first manned private spaceplane with SpaceShipOne.[14][15] He received numerous awards and honors in several different professions and was listed among the Time 100 Most Influential People in the World in 2007 and 2008.[16] Allen was diagnosed with Non-Hodgkin lymphoma in 2009. He died of septic shock related to the cancer on October 15, 2018.[17]

[...]

Allen (left) with Bill Gates at Lakeside School in 1970

Allen was born on January 21, 1953, in Seattle, Washington, to Kenneth Sam Allen and Edna Faye (née Gardner) Allen.[18] He attended Lakeside School, a private school in Seattle where he befriended Bill Gates, with whom he shared an enthusiasm for computers, and they used Lakeside's Teletype terminal to develop their programming skills on several time-sharing computer systems.[19] They also used the laboratory of the Computer Science Department of the University of Washington, doing personal research and computer programming; they were banned from the laboratory in 1971 for abuse of their privileges there.[20]

Gates and Allen joined with Ric Weiland and Gates' childhood best friend and first collaborator, Kent Evans, to form the Lakeside Programming Club and find bugs in Computer Center Corporation's software, in exchange for extra computer time. In 1972, after Evans' sudden death due to a mountain climbing accident, Gates turned to Allen for help finishing an automated system of Lakeside's entire class scheduling procedure.[21] They then formed Traf-O-Data to make traffic counters based on the Intel 8008 processor. According to Allen, he and Gates would go "dumpster diving" in their teenage years for computer program code.[22]

Allen attained a perfect SAT score of 1600[23] and went to Washington State University, where he joined the Phi Kappa Theta fraternity.[24][25][26] He dropped out of college after two years to work as a programmer for Honeywell in Boston near Harvard University where Gates was enrolled.[19] Allen convinced Gates to drop out of Harvard in order to create Microsoft.[27]

Microsoft

The title page of the assembly language code that produced Altair BASIC, developed by Allen, Gates, and Monte Davidoff, with two early Microsoft business cards showing Gates as president and Allen as vice president

Main articles: History of Microsoft and Microsoft § 1972–1985: The founding of Microsoft

Allen and Gates formed Microsoft in 1975 in Albuquerque, New Mexico, and began marketing a BASIC programming language interpreter, with their first employee being high school friend and collaborator Ric Weiland.[28][19] Allen came up with the name of "Micro-Soft", a combination of "microcomputer" and "software".[29]

Microsoft committed to delivering a disk operating system (DOS) to IBM for the original IBM PC in 1980, although they had not yet developed one, and Allen spearheaded a deal for Microsoft to purchase QDOS (Quick and Dirty Operating System) written by Tim Paterson who was employed at Seattle Computer Products.[30][31] As a result of this transaction, Microsoft secured a contract to supply the DOS that ran on IBM's PC line and led to Allen's and Gates' wealth and success.[19]

The relationship between Allen and Gates became strained as they argued even over small things.[21] Allen effectively left Microsoft in 1982 after being diagnosed with Hodgkin's lymphoma, though he remained on the board of directors as vice chairman.[19][32] Gates reportedly asked Allen to give him some of his shares to compensate for the higher amount of work that Gates was doing.[33][34] According to Allen, Gates said that he "did almost everything on BASIC" and the company should be split 60–40 in his favor. Allen agreed to this arrangement, which Gates later renegotiated to 64–36.[35] In 1983, Gates tried to buy Allen out at $5 per share, but Allen refused and left the company with his shares intact; this made him a billionaire when Microsoft went public

tried to buy Allen out at $5 per share, but Allen refused and left the company with his shares intact; this made him a billionaire when Microsoft went public.[35][36] Gates later repaired his relationship with Allen, and the two men donated $2.2 million to their childhood school Lakeside in 1986.[21] They remained friends for the rest of Allen's life.[37]

Allen resigned from his position on the Microsoft board of directors on November 9, 2000, but he remained as a senior strategy advisor to the company's executives.[38][39][40] In January 2014, he still held 100 million shares of Microsoft.[41]

Business and investments

See also: Vulcan Inc.

Financial and technology

Vulcan Capital is an investment arm of Allen's Seattle-based Vulcan Inc., which has managed his personal fortune. In 2013, Allen opened a new Vulcan Capital office in Palo Alto, California, to focus on making new investments in emerging technology and internet companies.[42]

Patents: Allen held 43 patents from the United States Patent and Trademark Office.[43]

Apps: Allen backed A.R.O., the startup behind the mobile app Saga;[44] SportStream, a social app for sports fans;[45] and a content-management app called Fayve.[46]

Interval Research Corporation: In 1992, Allen and David Liddle co-founded Interval Research Corporation, a Silicon Valley-based laboratory and new business incubator that was dissolved in 2000 after generating over 300 patents,[47] four of which were the subject of Allen's August 2010 patent infringement lawsuit against AOL, Apple, eBay, Facebook, Google, Netflix, Office Depot, OfficeMax, Staples, Yahoo!, and YouTube.[48][49]

Ticketmaster: In November 1993, Allen invested more than $325 million to acquire 80% of Ticketmaster.[50][51] In 1997, Home Shopping Network acquired 47.5% of Allen's stock in exchange for $209 million worth of their own stock.[52]

Charter Communications: In 1998, Allen bought a controlling interest in Charter Communications.[53] Charter filed for bankruptcy reorganization in 2009, with Allen's loss estimated at $7 billion. Allen kept a small stake after Charter emerged from reorganization, worth $535 million in 2012.[54] The company's 2016 purchase and subsequent merger of Time Warner Cable with Charter's subsidiary, Spectrum, made Charter Communications the second-largest cable company in the U.S.[55][56]

Aerospace

Allen confirmed that he was the sole investor behind aerospace engineer and entrepreneur Burt Rutan's SpaceShipOne suborbital commercial spacecraft on October 4, 2004.[57] The craft was developed and flown by Mojave Aerospace Ventures, which was a joint venture between Allen and Rutan's aviation company, Scaled Composites. SpaceShipOne climbed to an altitude of 377,591 feet (115,090 m) over the Mojave Air and Space Port and was the first privately funded effort to successfully put a civilian in suborbital space. It won the Ansari X Prize competition and received the $10 million prize.[58]

The Stratolaunch aircraft, 2018

On December 13, 2011, Allen announced the creation of Stratolaunch Systems, based at the Mojave Air and Space Port. The Stratolaunch is a proposed orbital launch system consisting of a dual-bodied, 6-engine jet aircraft, capable of carrying a rocket to high altitude; the rocket would then separate from its carrier aircraft and fire its own engines to complete its climb into orbit. If successful, this project would be the first wholly privately funded space transport system.[59] Stratolaunch, which is partnering with Orbital ATK and Scaled Composites, is intended to launch in inclement weather, fly without worrying about the availability of launch pads and to operate from different locations. Stratolaunch plans to ultimately host six to ten missions per year.[60] On April 13, 2015, Vulcan Aerospace was announced. It is the company within Allen's Vulcan Inc. that plans and executes projects to shift how the world conceptualizes space travel through cost reduction and on-demand access.[61]

On April 13, 2019, the Stratolaunch aircraft made its maiden flight, reaching 15,000 ft (4,600 m) and 165 kn (305 km/h) in a 2 h 29 min flight.[62][63] Stratolaunch CEO Jean Floyd offered this comment: "We dedicate this day to the man who inspired us all to strive for ways to empower the world's problem-solvers, Paul Allen. Without a doubt, he would have been exceptionally proud to see his aircraft take flight".[64]

As of the end of May 2019, Stratolaunch Systems Corporation is closing operations.[65]

Real estate

Allen's Vulcan Real Estate[66] division offers development and portfolio management services, and is known for the redevelopment of the South Lake Union neighborhood immediately north of downtown Seattle.[67] Vulcan has developed 6.3 million square feet (590,000 m2) of new residential, office, retail and biotechnology research space, and has a total development capacity of 10,000,000 sq ft (930,000 m2). Vulcan advocated for the Seattle Streetcar line known as South Lake Union Streetcar, which runs from Seattle's Westlake Center to the south end of Lake Union.[68] In 2012, The Wall Street Journal called Allen's South Lake Union investment "unexpectedly lucrative" and one that led to his firm selling a 1,800,000-square-foot (170,000 m2) office complex to Amazon.com for US$1.16 billion, one of the most expensive office deals ever in Seattle.[69] "It's exceeded my expectations", Allen said of the South Lake Union development.[70]

Venues

Sports and event centers: Allen funded the development of Portland's Moda Center, which he purchased in 2007.[71] He also contributed $130 million to help build CenturyLink Field in Seattle.[72]

Seattle Cinerama: Allen purchased Seattle's historic Cinerama Theater in 1998, and upgraded it with 3-D capability and digital sound, in addition to interior and exterior refurbishing. The theater installed the world's first commercial digital laser projector in 2014.[73]

Hospital Club: Allen opened the Hospital Club in London in 2004 as a professional and social hub for people working in the creative arts.[74] A second location in Los Angeles is under construction.[75]

Sports team ownership

Portland Trail Blazers

Main article: Portland Trail Blazers

Allen purchased the Portland Trail Blazers NBA team in 1988 from California real estate developer Larry Weinberg for $70 million.[6] He was instrumental in the development and funding of the Moda Center (previously known as the Rose Garden), the arena where the Blazers play. He purchased the arena on April 2, 2007, and stated that this was a major milestone and a positive step for the franchise.[19][76] The Allen-owned Trail Blazers reached the playoffs 19 times including the NBA Finals in 1990 and 1992.[77] According to Forbes, the Blazers were valued at $940 million in 2015 and ranked No. 12 out of 30 NBA teams.[78]

Seattle Seahawks

Main article: Seattle Seahawks

Allen purchased the NFL's Seattle Seahawks in 1997 from owner Ken Behring,[79][80] who had attempted to move the team to southern California the previous year.[5][81][82] Herman Sarkowsky, a former Seahawks minority owner, told The Seattle Times about Allen's decision to buy the team, "I'm not sure anybody else in this community would have done what [Allen] did."[83] In 2002, the team moved into CenturyLink Field, after Allen invested into the upgrade of the stadium.[84] Acquired for $200 million in 1997,[79][80] the Seahawks were valued at $1.33 billion in August 2014 by Forbes, which says the team has "one of the most rabid fan bases in the NFL".[85] Under the helm of Allen, the Seahawks made the Super Bowl three times following NFC Championship victories (2005, 2013, 2014), and won Super Bowl XLVIII in February 2014.[86]

Seattle Sounders FC

Main article: Seattle Sounders FC

Allen's Vulcan Sports & Entertainment is part of the ownership team of the Seattle Sounders FC, a Major League Soccer (MLS) franchise that began play in 2009 at CenturyLink Field, a stadium which was also controlled by Allen.[7] The ownership team also includes film producer Joe Roth, businessman Adrian Hanauer, and comedian Drew Carey. The Sounders sold out every home game during its first season, setting a new MLS record for average match attendance.[87]

Filmmaking

Allen and his sister, Jody Allen, together were the owners and executive producers of Vulcan Productions,[88] a television and film production company headquartered in Seattle within the entertainment division of Vulcan Inc. Their films have received various recognition, ranging from a Peabody Award[89] to Independent Spirit Awards,[90] Grammys[91] and Emmys.

In 2014 alone, Allen's film, We The Economy, won 12 awards including a Webby award for best Online News & Politics Series. The films have also been nominated for Golden Globes[91] and Academy Awards[90] among many others. Vulcan Productions' films and documentary projects include Far from Heaven[90] (2002), Hard Candy[92] (2005), Rx for Survival: A Global Health Challenge[93][94] (2005), Where God Left His Shoes[95] (2006), Judgment Day: Intelligent Design on Trial[96][97] (2007), This Emotional Life[98][99] (2010), We The Economy[100] (2014) Racing Extinction[101] (2015) and Oscar-nominated Body Team 12[102] (2015).

In 2013, Vulcan Productions co-produced the Richard E. Robbins-directed film Girl Rising[103] which tells the stories of girls from different parts of the world who seek an education. Globally, over 205 million households watched Girl Rising during the CNN premier,[104] and over 4 million people have engaged with Girl Rising through websites and social media. Through the associated 10×10 program, over $2.1 million has been donated to help girls receive an education worldwide.[105]

Also in 2013, Vulcan Productions signed on as a producing partner of Pandora's Promise,[106] a documentary about nuclear power, directed by Oscar-nominated director Robert Stone. It was released on CNN in November 2013. A variety of college and private screenings as well as panel discussions have been hosted throughout the country.[107]

Philanthropy

Allen gave more than $2 billion towards the advancement of science, technology, education, wildlife conservation, the arts, and community services in his lifetime.[13] The Paul G. Allen Family Foundation, which he founded with his sister Jody Allen, was established to administer a portion of Allen's philanthropic contributions. Since its formation, the foundation has given more than $494 million to over 1,500 nonprofits; and,[108] in 2010, Allen became a signatory of The Giving Pledge, promising to give at least half of his fortune to philanthropic causes.[109] Allen received commendations for his philanthropic commitments including the Andrew Carnegie Medal of Philanthropy[110] and Inside Philanthropy's "Philanthropist of the Year".[111]

Science and research

Allen (right) studies a brain sample with Allan Jones, CEO of the Allen Institute for Brain Science, in 2011

In September 2003, Allen launched the Allen Institute for Brain Science with a $100 million contribution dedicated to understanding how the human brain works. In total, Allen donated $500 million to the institute, making it his single largest philanthropic recipient. Since its launch, the Allen Institute for Brain Science has taken a Big Science and Open Science approach to tackle projects. The institute makes research tools available to the scientific community using an open data model.[112] Some of the institute's most notable projects include the Allen Mouse Brain Atlas, Allen Human Brain Atlas and the Allen Mouse Brain Connectivity Atlas. The Allen Institute is also helping to advance and shape the White House's BRAIN Initiative as well as the Human Brain Project.[113]

Founded in 2014, the Allen Institute for Artificial Intelligence (AI2)'s main focus is to research and engineer artificial intelligence.[114] The Institute is modeled after the Allen Institute for Brain Science and led by researcher and professor, Dr. Oren Etzioni. AI2 has undertaken four main projects, Aristo, Semantic Scholar, Euclid, and Plato. Project Aristo is working to build an AI system capable of passing an 8th-grade science exam.[115]

In December 2014, Allen committed $100 million to create the Allen Institute for Cell Science in Seattle. The institute is investigating and creating a virtual model of cells in the hope of bringing forth treatment of different diseases.[116] Like the institutes before it, all data generated and tools developed will be made publicly available online.[117]

Launched in 2016 with a $100 million commitment, The Paul G. Allen Frontiers Group aims to discover and support ideas at the frontier of bioscience in an effort to accelerate the pace of discovery.[118] The group is led by Tom Skalak and will be targeting scientists and research areas that "some might consider out-of-the-box at the very edges of knowledge".[119]

Allen launched the Allen Distinguished Investigators Awards (ADI) in 2010 to support scientists pursuing early-stage research projects who often have difficulty securing funding from traditional sources.[120]

Allen donated the seed money to build SETI's Allen Telescope Array, eventually contributing $30 million to the project.[121]

The Paul Allen's flower fly was named in recognition of his contributions to Dipterology.[122]

Environment and conservation

Allen provided more than $7 million to fund a census of elephant populations in Africa, the largest such endeavour since the 1970s. The Great Elephant Census team flew over 20 countries to survey African savannah elephants. The survey results were published in 2015 and showed rapid rates of decline which were accelerating.[123]

He began supporting the University of British Columbia's Sea Around Us Project in 2014 to improve data on global fisheries as a way to fight illegal fishing. Part of his $2.6 million in funding went towards the creation of FishBase,[124] an online database about adult finfish.[125] Allen funded the Global FinPrint initiative, launched in July 2015, a three-year survey of sharks and rays in coral reef areas. The survey is the largest of its kind and designed to provide data to help conservation programs.[126][127]

Allen backed Washington state initiative 1401 to prohibit the purchase, sale and distribution of products made from 10 endangered species including elephants, rhinos, lions, tigers, leopards, cheetahs, marine turtles, pangolins, sharks and rays. The initiative gained enough signatures to be on the state's ballot on November 3, 2015, and passed.[128]

Alongside the United States Department of Transportation (USDOT), Allen and Vulcan Inc. launched the Smart City Challenge,[129] a contest inviting American cities to transform their transportation systems. Created in 2015 with the USDOT's $40 million commitment as well as $10 million from Allen's Vulcan Inc., the challenge aims to create a first-of-its-kind modern city that will demonstrate how cities can improve quality of life while lowering greenhouse gas emissions.[130] The winning city was Columbus, Ohio.[131]

As a founding member of the International SeaKeepers Society, Allen hosted its proprietary SeaKeeper 1000TM oceanographic and atmospheric monitoring system on all three of his megayachts.[132]

Allen funded the building of microgrids, which are small-scale power grids that can operate independently, in Kenya to help promote reusable energy and empower its businesses and residents.[133] He was an early investor in the Mawingu Networks, a wireless and solar-powered Internet provider which aims to connect rural Africa with the world, and Off Grid Electric, a company focused on providing solar energy to people in emerging nations.[134]

Ebola

In 2014, Allen pledged at least $100 million toward the fight to end the Ebola virus epidemic in West Africa,[135] making him the largest private donor in the Ebola crisis. He also created a website called TackleEbola.org[136] as a way to spread awareness and serve as a vehicle for donors to fund projects in need. The site additionally highlighted organizations working to stop Ebola that Allen supported such as International Red Cross and Red Crescent Movement, Médecins Sans Frontières, Partners in Health, UNICEF and World Food Program USA. On April 21, 2015, Allen brought together key leaders in the Ebola fight at the Ebola Innovation Summit in San Francisco. The summit aimed to share key learnings and reinforce the need for continued action and support to bring the number of Ebola cases down to zero, which was achieved in January 2016.[137]

In October 2015, the Paul G. Allen Family Foundation announced it would award seven new grants totaling $11 million to prevent future widespread outbreaks of the virus.[138]

Exploration

In 2012, along with his research team and the Royal Navy, Allen attempted to retrieve the bell from HMS Hood, which sank in the Denmark Strait during World War II, but the attempt failed due to poor weather. On August 7, 2015, they tried again and recovered the bell in very good condition.[139] It was restored and put on display in May 2016 in the National Museum of the Royal Navy, Portsmouth, in remembrance of the 1,415 crewmen lost.[140]

Since 2015, Allen funded the research ship RV Petrel, and he purchased the ship in 2016. The project team aboard Petrel was responsible for locating the Japanese battleship Musashi in 2015.[141] In 2017, on Allen's directions, Petrel found USS Indianapolis, USS Ward, the wrecks of the Battle of Surigao Strait and the Battle of Ormoc Bay. In 2018, Petrel found a lost US Navy C-2A Greyhound aircraft in the Philippine Sea, USS Lexington in the Coral Sea and the USS Juneau off the coast of the Solomon Islands.[142][143][144]

The arts

Allen established several non-profit community institutions that feature his private collections of historic artifacts. These include:

Museum of Pop Culture, or MoPOP, is a nonprofit museum, dedicated to contemporary popular culture inside a Frank Gehry-designed building at Seattle Center, established in 2000.[145]

Flying Heritage Collection, which showcases restored vintage military aircraft and armaments primarily from the World War II era, established in 2004.[146]

STARTUP Gallery, a permanent exhibit at the New Mexico Museum of Natural History and Science in Albuquerque dedicated to the history of the microcomputer, established in 2007.[147]

Living Computer: Museum + Labs, a collection of vintage computers in working order and available for interactive sessions on-site or through networked access, opened to the public in 2012.[148][149]

An active art collector, Allen gifted more than $100 million to support the arts.[150] On October 15, 2012, the Americans for the Arts gave Allen the Eli and

Edythe Broad Award for Philanthropy in the Arts.[151] Allen also loaned out more than 300 pieces from his private art collection to 47 different venues. In 2013, Allen sold Barnett Newman's Onement VI (1953) at Sotheby's in New York for $43.8 million which at the time was the record price to have been paid for a work by the abstract artist.[152][153]

In 2015, Allen founded the Seattle Art Fair, a four-day event with 60-plus galleries from around the world including the participation of the Gagosian Gallery, David Zwirner, and many others. The event drew thousands and inspired other satellite fairs throughout the city.[154]

In August 2016, Allen announced the launch of Upstream Music Fest + Summit,[155] an annual festival fashioned after South by Southwest.[156] Held in Pioneer Square, the first festival took place in May 2017.[157]

Education

Allen and Steve Wozniak at the Living Computer Museum in 2017

In 1989, Allen donated $2 million to the University of Washington to construct the Allen Library, which was named after his father Kenneth S. Allen, a former associate director of the University of Washington library system.[158] In the same year, Allen donated an additional $8 million to establish the Kenneth S. Allen Library Endowment.[159] In 2012, the endowment was renamed the Kenneth S. and Faye G. Allen Library Endowment after Allen's mother (a noted bibliophile) died.[160]

In 2002, Allen donated $14 million to the University of Washington to construct the Paul G. Allen Center for Computer Science and Engineering.[161] The building was dedicated in October 2003.[162]

In 2010, Allen announced a gift of $26 million to build the Paul G. Allen School of Global Animal Health at Washington State University, his alma mater. The gift was the largest private donation in the university's history.[163]

In 2016, Allen pledged a $10 million donation over four years for the creation of the Allen Discovery Centers at Tufts University and Stanford University. The centers would fund research that would read and write the morphogenetic code. Over eight years the donation could be as much as $20 million.[164]

In 2017, Allen donated $40 million (with an additional $10 million added by Microsoft) to reorganize the University of Washington's Computer Science and Engineering department into the Paul G. Allen School of Computer Science and Engineering.[165]

Music

Paul Allen and the Underthinkers perform at the Allen Institute for Brain Science's 10th-anniversary gala

Allen received his first electric guitar at the age of sixteen, and was inspired to play it by listening to Jimi Hendrix.[166] In 2000, Allen played rhythm guitar on the independently produced album Grown Men.[167] In 2013, he had a major label release on Sony's Legacy Recordings; Everywhere at Once by Paul Allen and the Underthinkers.[168] PopMatters.com described Everywhere at Once as "a quality release of blues-rock that's enjoyable from start to finish".[169][170]

On February 7, 2018, an interview with Quincy Jones was released by the magazine New York on their Vulture website. In this interview, Jones said that he had extreme respect for Eric Clapton, his band Cream, and Allen. Referencing Allen's Hendrix-like play, the article mentioned a jam session on a yacht with Stevie Wonder.[171]

Yachting

Allen's Octopus off the Cayman Islands in 2010

Allen's 414-foot (126 m) yacht, Octopus, was launched in 2003.[172] As of 2019, it was 20th on the list of motor yachts by length. The yacht is equipped with two helicopters, a submarine, an ROV, a swimming pool, a music studio and a basketball court.[173] Octopus is a member of AMVER, a voluntary group ship reporting system used worldwide by authorities to arrange assistance for those in distress at sea.[174] The ship is also known for its annual celebrity-studded parties which Allen hosted at the Cannes film festival,[175] where Allen and his band played for guests. These performances included musicians such as Usher and David A. Stewart.[176] Octopus was also used in the search for a missing American pilot and two officers whose plane disappeared off Palau[177] and the study of a rare fish called a coelacanth among many others.[178]

Allen also owned Tatoosh, which is one of the world's 100 largest yachts. In January 2016, it was reported that Tatoosh allegedly damaged coral in the

Cayman Islands.[179] In April 2016, the Department of Environment (DoE) and Allen's Vulcan Inc. successfully completed a restoration plan to help speed recovery and protect the future of coral in this area.[180]

Death

Allen was diagnosed with Stage 1-A Hodgkin's lymphoma in 1982.[35] Although his cancer was successfully treated by several months of radiation therapy,[32] Allen was diagnosed with non-Hodgkin lymphoma in 2009. Likewise, the cancer was successfully treated until it returned in 2018, which ultimately caused his death by septic shock on October 15, 2018.[181][17] He was 65 years old.[182][183][184]

Several Seattle-area landmarks, including the Space Needle, Columbia Center and CenturyLink Field, as well as various Microsoft offices throughout the United States, were illuminated in blue on November 3, 2018, as a tribute to Allen.[185] He was also honored by his early business partner and lifelong friend Bill Gates, who said in a statement:

> Paul loved life and those around him, and we all cherished him in return. He deserved much more time, but his contributions to the world of technology and philanthropy will live on for generations to come. I will miss him tremendously.[37]

Awards and recognition

Allen received numerous awards in many different areas, including sports, philanthropy, and the arts:

In 2004, Allen, Burt Rutan, Doug Shane, Mike Melvill, and Brian Binnie won the Collier Trophy for SpaceShipOne.[14]

On March 9, 2005, Allen, Rutan, and the rest of the SpaceShipOne team were awarded the 2005 National Air and Space Museum Trophy for Current Achievement.[15]

In 2007 and 2008, Allen was listed among the Time 100 Most Influential People in The World.[16]

He received the Vanguard Award from the National Cable & Telecommunications Association on May 20, 2008.[186]

On October 30, 2008, the Seattle-King County Association of Realtors honored Allen for his "unwavering commitment to nonprofit organizations in the Pacific Northwest and lifetime giving approaching US$1 billion".[187]

In 2009, Allen's philanthropy as the long-time owner of the Portland Trail Blazers was recognized with an Oregon Sports Award.[188]

On October 26, 2010, Allen was awarded the W. J. S. Krieg Lifetime Achievement Award for his contributions to the field of neuroscience by the Cajal Club.[189]

On January 26, 2011, at Seattle's Benaroya Hall, Allen was named Seattle Sports Commission Sports Citizen of the Year, an award that has been renamed the Paul Allen Award.[190]

In 2011, Allen was elected to the American Academy of Arts and Sciences.[191]

On October 15, 2012, Allen received the Eli and Edythe Broad Award for Philanthropy in the Arts at the National Arts Awards.[192]

On February 2, 2014, Allen received a Super Bowl ring as the Seattle Seahawks won the Vince Lombardi Trophy.[193]

On October 22, 2014, Allen received a Lifetime Achievement Award from Seattle Business magazine for his impact in and around the greater Puget Sound region.[194]

On December 31, 2014, online philanthropy magazine Inside Philanthropy made Allen their inaugural "Philanthropist of the Year"[111] for his ongoing effort to stop the Ebola outbreak in West Africa, breaking ground on a new research center in Seattle, and his battle to save the world's oceans.

In 2014, Allen was inducted into the International Space Hall of Fame.[195]

On July 18, 2015, Ischia Global Film and Music Festival recognized Allen with the Ischia Humanitarian Award. Event organizers honored Allen for his contributions to social issues through his philanthropic efforts.[196]

On August 25, 2015, Allen was named a recipient of the Andrew Carnegie Medal of Philanthropy for his work to "save endangered species, fight Ebola, research the human brain, support the arts, protect the oceans, and expand educational opportunities for girls".[197]

On October 3, 2015, the Center for Infectious Disease Research presented Allen with the 2015 "Champion for Global Health Award" for his leadership and effort to fight Ebola.[198]

On December 10, 2016, Allen, as co-owner of the Seattle Sounders, won the 2016 MLS Cup.[199]

On October 3, 2019, Allen was posthumously inducted into the Seattle Seahawks Ring of Honor.[200]

Honorary degrees

Honorary degree from the Washington State University. The university bestowed its highest honor, the Regents' Distinguished Alumnus Award, upon him.[201]

Honorary doctorate in Philosophy from Nelson Mandela Metropolitan University.[202]

Honorary doctorate of Science from the Cold Spring Harbor Laboratory's Watson School of Biological Sciences.[203]

Honorary degree from the École Polytechnique Fédérale de Lausanne.[204]

Honorary degree from the École Polytechnique Fédérale de Lausanne.[204]

Idea Man

In 2011, Allen's memoir, Idea Man: A Memoir by the Cofounder of Microsoft, was published by Portfolio, a Penguin Group imprint. The book recounts how Allen became enamored with computers at an early age, conceived the idea for Microsoft, recruited his friend Bill Gates to join him, and launched what would become the world's most successful software company. It also explores Allen's business and creative ventures following his 1983 departure from Microsoft, including his involvement in SpaceShipOne, his purchase of the Portland Trail Blazers and Seattle Seahawks, his passion for music, and his ongoing support for scientific research. The book made The New York Times Best Seller list and the paperback version, which included a new epilogue, came out on October 30, 2012.[205][206]

The tests come after a long series of taxi tests that always stopped just short of achieving actual flight, but now that threshold has been crossed, and the engineers seem pleased with the results.

Mikhail Naumovich Alperovitch (born 1951)

[HW0004][GDrive]

Partners - Married to Tatiana Alperovitch

Children - **Dmitri Alperovitch (born 1980)**

2017 article from State of the Nation

Source article : [HW0001][GDrive]

"If someone steals your keys to encrypt the data, it doesn't matter how secure the algorithms are." — Dmitri Alperovitch, founder of CrowdStrike

[...]

[Dmitri] Alperovitch and the DNC

After CrowdStrike was hired as an independent "vendor" by the DNC to investigate a possible cyberattack on their system, Alperovitch sent the DNC a proprietary software package called ***Falcon*** that monitors the networks of its clients in real time. According to Alperovitch, *Falcon* "lit up," within ten seconds of being installed at the DNC. Alperovitch had his "proof" in TEN SECONDS that Russia was in the network. This "alleged" evidence of Russian hacking has yet to be shared with anyone.

[...]

It is also absurd to hear Alperovitch state that the Russian FSB (equivalent to the CIA) had been monitoring the DNC site for over a year and had done nothing. No attack, no theft, and no harm was done to the system by this "false-flag cyber-attack" on the DNC – or at least, Alperovitch "reported" there was an attack. The second hacker, the supposed Russian military (GRU – like the U.S. DoD) hacker, had just entered the system two weeks before and also had done "nothing" but observe.

[...]

Once again, Guccifer 2.0 proved Alperovitch and CrowdStrike's claims to be grossly incorrect about the hack originating from Russia, with Putin masterminding it all. Nancy Pelosi offered members of Congress Alperovitch's suggestion of installing *Falcon*, the system that failed to stop cyberattacks at the DNC, on all congressional laptops.

Key Point: **Once *Falcon* was installed on the computers of members of the U.S. Congress, CrowdStrike had even further full access into U.S. government accounts.**

[...]

Dmitri – Front Man for His Father's Russian Espionage Mission

After taking a close look at the disinformation around Dmitri and his father, it is clear to see that **Michael Alperovitch became a CIA operative** during his first visit to America. Upon his return to Russia, he stole the best Russian encryption codes that were used to protect the top-secret work of nuclear physics in which his father is alleged to have been a major player. **Upon surrendering the codes to the CIA when he returned to Canada, the CIA made it possible for a Russian nuclear scientist to become an American citizen overnight and gain a top-secret security clearance to work at the Oakridge plant, one of the most secure and protected nuclear facilities in America**. Only the CIA can transform a Russian into an American with a top-secret clearance overnight.

We can see on Michael Alperovitch's Linked In page that he went from one fantastically top-secret job to the next without a break from the time he entered America. He seemed to be on a career path to work in every major U.S. agency in America. In every job he was hired as the top expert in the field and the leader of the company. All of these jobs after the first one were in cryptology, not nuclear physics. As a matter of fact, Michael became the top expert in America overnight and has stayed the top expert to this day.

Most of the work of cyber-security is creating secure interactions on a non-secure system like the Internet. **The cryptologist who assigns the encryption codes controls the system from that point on**.

Key Point: **Cryptologists are well known for leaving a "back-door" in the base-code so that they can always have over-riding control.**

Michael Alperovitch essentially has the "codes" for all Department of Defense sites, the Treasury, the State Department, cell-phones, satellites, and public media. There is hardly any powerful agency or company that he has not written the "codes" for. One might ask, why do American companies and the U.S. government use his particular codes? What are so special about Michael's codes?

Stolen Russian Codes

In December, Obama ordered the U.S. military to conduct cyberattacks against Russia in retaliation for the alleged DNC hacks. All of the attempts to attack Russia's military and intelligence agencies failed miserably. Russia laughed at Obama's attempts to hack their systems. Even the Russian companies targeted by the attacks were not harmed by Obama's cyber-attacks. Hardly any news of these massive and embarrassing failed cyber-attacks were reported by the Main Stream Media. The internet has been scrubbed clean of the reports that said Russia's cyber-defenses were impenetrable due to the sophistication of their encryption codes.

Michael Alperovitch was in possession of those impenetrable codes when he was a top scientist in Russia. **It was these very codes that he shared with the CIA on his first trip to America**. These codes got him spirited into America and "turned into" the best cryptologist in the world. **Michael is simply using the effective codes of Russia to design his codes for the many systems he has created in America for the CIA**.

KEY POINT: It is crucial to understand at this junction that **the CIA is not solely working for America**. The CIA works for itself and there are three branches to the CIA – two of which are hostile to American national interests and support globalism.

Michael and Dmitri Alperovitch work for the CIA (and international intelligence corporations) **who support globalism**. They, and the globalists for whom they work, are not friends of America or Russia. It is highly likely that the criminal activities of Dmitri, which were supported and sponsored by the FBI, created the very hackers who he often claims are responsible for cyberattacks. None of these supposed "attackers" have ever been found or arrested; they simply exist in the files of CrowdStrike and are used as the "usual culprits" when the FBI or CIA calls in Dmitri to give the one and only opinion that counts. Only Dmitri's "suspicions" are offered as evidence and yet 17 U.S. intelligence agencies stand behind the CrowdStrike report and Dmitri's suspicions.

Michael Alperovitch – Russian Spy with the Crypto-Keys

Essentially, Michael Alperovitch flies under the false-flag of being a cryptologist who works with PKI. A public key infrastructure (PKI) is a system for the creation, storage, and distribution of digital certificates which are used to verify that a particular public key belongs to a certain entity. The PKI creates digital certificates which map public keys to entities, securely stores these certificates in a central repository and revokes them if needed. Public key cryptography is a cryptographic technique that enables entities to securely communicate on an insecure public network (the Internet), and reliably verify the identity of an entity via digital signatures. Digital signatures use Certificate Authorities to digitally sign and publish the public key bound to a given user. This is done using the CIA's own private key, so that trust in the user key relies on one's trust in the validity of the CIA's key. **Michael Alperovitch is considered to be the number one expert in America on PKI and essentially controls the market**.

Michael's past is clouded in confusion and lies. Dmitri states that his father was a nuclear physicist and that he came to America the first time in a nuclear based shared program between America and Russia. But if we look at his current personal Linked In page, Michael claims he has a Master Degree in Applied Mathematics from Gorky State University. From 1932 to 1956, its name was State University of Gorky. Now it is known as Lobachevsky State University of Nizhni Novgorod – National Research University (UNN), also known as Lobachevsky University. Does Michael not even know the name of the University he graduated from? And when does a person with a Master's Degree become a leading nuclear physicist who comes to "visit" America. In Michael's Linked In page there is a long list of his skills and there is no mention of nuclear physics.

[...]

Michael Alperovitch's Linked In Page

Education:

Gorky State University, Russia, MS in Applied Mathematics

Work History:

- *Sr. Security Architect :* **VT IDirect** -2014 – Designing security architecture for satellite communications including cryptographic protocols, authentication.
- *Principal SME (Contractor) :* **DISA-Defense Information Systems Agency** (Manager of the Global Information Grid) – 2012-2014 – Worked on PKI and identity management projects for DISA utilizing Elliptic Curve Cryptography. Performed application security and penetration testing.
- *Technical Lead (Contractor) :* **U.S. Department of the Treasury** – 2011 – Designed enterprise validation service architecture for PKI certificate

credentials with Single Sign On authentication.

- *Principal Software Engineer :* **Comtech Mobile Datacom** – 2007-2010 – Subject matter expert on latest information security practices, including authentication, encryption and key management.
- *Sr. Software Engineer :* **TriCipher** – 2006-2007 – Designed and developed security architecture for TriCipher Armored Credential Authentication System.
- *Lead Software Engineer :* **BellSouth** – 2003-2006 – Designed and built server-side Jabber-based messaging platform with Single Sign On authentication.
- *Principal Software Research Engineer :* **Pathfire, Inc.** – 2001-2002 – Designed and developed Digital Rights Management Server for Video on Demand and content distribution applications. Pathfire provides digital media distribution and management solutions to the television, media, and entertainment industries. The company offers Digital Media Gateway, a digital IP store-and-forward platform, delivering news stories, syndicated programming, advertising spots, and video news releases to broadcasters. It provides solutions for content providers and broadcasters, as well as station solutions.

[...]

1990 - Michael is sent to Maryland (USA) as part of a nuclear-safety training program for scientists (and "simulation program"

"In 1990, [Dmitri Alperovitch's] father was sent to Maryland as part of a nuclear-safety training program for scientists. Per Soviet custom, Dmitri stayed in the USSR to ensure that his parents didn't defect. [Dmitri Alperovitch] lived with his grandparents, and when his parents returned, after a year, they brought him his Brst computer, an IBM PC." Source : [HP0001][GDrive]

Upon his return, we discover that Mikhail Alperovitch was working on a nuclear power plant simulation project. See [HB0008][GDrive]

The company that Mikhail worked at was "most likely" going to be GSE Systems, Inc.

A Google Search - "nuclear power plant simulation maryland" leads us to the following results shown below, with two companies present. One is "WSC - Western Services Corporation", which was founded in 1995 (see https://scs.org/wp-content/uploads/2017/02/Session-3-Ashy-Oussama.pdf) - Since Mikhail came to Maryland in 1990, it cant be WSC. It is was thus most likely the other company, which is GSE Systems, Inc. .

"In 1994, his father was granted a visa to Canada, "

1995 - Michael moves the Alperovitch family to Chattanooga, Tennessee (USA), to work at the TVA

Source : [HP0001][GDrive]

"In 1994, his father was granted a visa to Canada, and a year later the family moved to Chattanooga, where Michael took a job with the Tennessee Valley Authority. The work was not particularly challenging, so Michael began studying cryptography on the side. While Dmitri was still in high school, he and his father started an encryption-technology business. Dmitri says he loved the beauty of the math but also saw cryptography's fatal \aw: "If someone stole your keys to encrypt the data, it didn't matter how secure the algorithms were." "

1990s (Mid) - No work in nuclear power or Mikhail Alperovitch - (source : 2018 Forbes Article)

● The Top Secret Messenger software was developed by Encryption Software Inc. It encrypts the messages of some of the most popular instant messaging programs today, like ICQ and MSN. It can also be used with e-mail clients such as Microsoft Outlook and Outlook Express to encrypt e-mail messages. This product uses both private and public key cryptosystems, including a 307-bit key for its implementation of the ECC.

"Elliptic curves were proposed for use as the basis for discrete logarithm-based cryptosystems almost 20 years ago, independently by Victor Miller of IBM and Neal Koblitz of the University of Washington . At that time, elliptic curves were already being used in various cryptographic contexts.

Elliptic curves are rich mathematical structures that have shown usefulness in many different types of applications. ECC, like RSA has the role in digital signatures, secure key distribution, and encryption. ECC has the upper hand in the efficiency of algorithm. Some devices have limited processing capacity, storage, power supply, and bandwidth like the newer wireless devices and cellular telephones. When used, efficiency of the resource use is very important in these devices. ECC provides encryption functionality requiring a smaller percentage of the resources required by RSA and other algorithms, so it is used in these types of devices. In most cases, the longer the key length, the more protection that is provided, but ECC can provide the same level of protection with a smaller key size than RSA. Since smaller keys as in ECC require fewer resources of the device to perform the mathematical tasks. ECC cryptosystems use the properties of elliptic curves in their public key systems. The elliptic curves provide ways of constructing groups of elements and specific rules of how the elements within these groups combine. The properties between the groups are used to build cryptographic algorithms."

risen to $1,400 a week, a small fortune by Russian standards, especially for twentysomethings. In return, they worked twelve-hour shifts, churning out Facebook posts that hit on themes conveyed to them by email. On one floor, Russian-language trolls fought off opposition to Vladimir Putin. On another floor, they looked for any divisive issue in American society where a wedge could be driven via the Internet, to widen the natural fault lines in American politics and society.

Texas seemed particularly ripe for meddling. Few of the trolls and bot makers had been there, but they had read about it online and seen it in the movies. It didn't take much of a leap of imagination to form a "Heart of Texas" group that appeared to be based in Houston, but was actually operating near Red Square. They promoted a rally called "Stop Islamization of Texas," as if there were much Islamization to worry about. Then, in a masterful stroke, the Russians created an opposing group, "United Muslims of America," which scheduled a counter-rally, under the banner of "Save Islamic Knowledge." The idea was to motivate actual Americans—who had joined each of the Facebook groups—to face off against each other and prompt a lot of name-calling and, perhaps, some violence.

It was a testament to how easy it is to mislead some subgroups of American citizens on the web with a few cheap bots and someone imitating a local resident. But no one was more amazed than the young Russians in Saint Petersburg, who, their own emails later showed, could not believe their targets were so gullible.

If you are going to catch a Russian inside your networks, hiring a Russian who thinks the way the attackers think isn't a bad idea. By that measure, Dmitri Alperovitch was the right man for the job.

In his mid-30s, with sandy hair and broad smile, he was already a fixture in the Washington firmament: a cyber specialist who was a regular at foreign policy forums and seemed as interested in the geopolitics of the business as the bits and bytes. But it was hardly preordained that Alperovitch would get so far.

[HB0003][GDrive]

He was the son of Soviet nuclear scientist Michael Alperovitch, and spent his childhood and early teen years in Moscow, in the waning days of the Soviet Union. In 1986, when Dmitri was about five years old, Michael narrowly escaped an assignment that would have left his son fatherless. A fire had broken out at the Chernobyl nuclear power plant, and panicked Soviet officials wanted Michael and his colleagues to check it out. Michael had a bad feeling and declined. The scientists who went all developed cancer and died soon after.

His life spared by good luck, Michael began to think it might be time to get out. His opportunity came shortly after the breakup of the Soviet Union. The Alperovitch family left Moscow in 1994, moving first to Toronto before settling in Chattanooga when Michael had landed a job at the Tennessee Valley Authority. Dmitri eventually enrolled at Georgia Tech, graduating with what was, at the time, a rare degree in cybersecurity.

Out of college, Alperovitch bounced around a number of the digital stations of the cross, eventually joining McAfee, known for its early virus-protection products. His job was to analyze state sponsors of cyberattacks, and he did it well, publishing a long paper about a China-based group called "Shady Rat," which was behind the theft of intellectual property from American companies. McAfee had been acquired by Intel, the country's leading chipmaker, and the paper took off as one of the best-researched pieces of work tying the Chinese government to what Keith Alexander, then the head of the National Security Agency, used to call the "greatest transfer of wealth in history."

Unsurprisingly, the Chinese didn't care much for the research. Suddenly they were showing up in Intel's offices in Beijing, inspecting business licenses—completely unrelated to Alperovitch's work, naturally. One day, he recalled, he got a call from one of the company's top executives. "Do you realize we do 60 percent of our business in China?" he remembers the executive asking.

Actually, he hadn't known that. He resigned the next week and in 2011 moved on to create the cybersecurity firm CrowdStrike with

kept some of the sensitive data to acquire iPods, digital cameras, and video game consoles from online merchants, and sold the rest on IRC chat channels and carding forums. Their total take over the course of four months tapping away at their keyboards: close to $80,000.

When U.S. adware supplier Zango, then called 180solutions, began to balk at paying the Dutch bot masters, and then cut them off as affiliate adware distributors, the pair asked to be reinstated. When the company refused, they used their botnets to launch a retaliatory DDoS attack on Zango. The company reported the attack to the FBI, and the bot masters, along with a third suspect, shortly thereafter were tracked down and arrested in Amsterdam. The two men received eighteen-month prison sentences and were fined $11,800 and $5,000, respectively. The third suspect was released.

The fact that the Dutch pair was caught so easily (the attack was reported in August; the arrests followed in early October) suggested that the young bot masters, for all their diversified activities, played in the shallows of the cybercrime market. Botnets continued right on proliferating. Virus hunters and law enforcement could see the footprints of big-time bot masters on the move and obviously controlling the most sophisticated botnets. They just couldn't do much to stop the high-level bot masters from collaborating with organized crime rings. To dodge good guys monitoring the IRC chat channels, which most bot masters used to communicate with their bots, elite bot masters began directing their bots to report for instructions by clicking to obscure Web pages running on compromised servers.

"It looked just like regular Web traffic," says Rob Fleischman, chief technology officer at Denver-based tech-security company Simplicita. "They [bot masters] know the Web is like a giant haystack and that hiding their command-and-control servers on the Web makes them much harder to spot."

Clever bot masters also began using proxies—the favored mechanism to spread spam and launch DDoS attacks—to handle all routine communications. So a chat between a spammer and his hired bot master, for instance, would zigzag among a series of proxies; an investigator tracing communiqués between coconspirators would end up in a cul-de-sac of zombie PCs.

Dmitri Alperovitch assiduously mapped out this evolution as a principal research scientist at Secure Computing. As a youth growing up in

[HB0007][GDrive]

Moscow in the late 1980s, Alperovitch learned how to program computers from his father, Michael, a Russian nuclear physicist, who instructed him on paper since personal computers were not widely available in Russia at the time. Young Dmitri's lessons accelerated in the early 1990s, when Michael Alperovitch returned from a trip to Maryland, where he had worked on a nuclear power plant simulation project, and brought back the family's first home computer; Dmitri was eleven at the time and became intrigued with the mathematics behind breaking cryptographic algorithms.

Raised by a nuclear physicist father and a mother, Tatiana, who was a health-care information technology specialist, Alperovitch took the route bypassed by so many other bright Russians of his generation: he became a white hat. When a cybercriminal defrauded a close family friend, Alperovitch says he was repulsed. "Nothing would please me more than to see them go to jail," he says of the culprits. "The victim was very sick; she had had a stroke and wasn't completely functional in terms of her brain capacity. She was very easily defrauded."

In college he studied international affairs and emerged in the vanguard of virus hunters who began piecing together the nexus of cyberconflict and international policy. Out in the deeper waters, crime rings had begun hiring specialists to write viruses, manage botnets, and carry out various scams.

"Guys were making $20,000 to $30,000 a month. The top guys might make $100,000 a month," says Alperovitch. "These were the guys doing the full-scale attacks, sending out phishing e-mails, collecting bank accounts, logging in to accounts, doing interbank transfers, wiring the money out, and collecting the money, all while sitting comfortably in an apartment in Moscow."

Vardan Kushnir had such an apartment in downtown Moscow, out of which he ran the Centre for American English, the New York English Centre, and the Centre for Spoken English. These were front businesses for sending out spam. Kushnir was widely reviled as the Spam King of Russia, where, unlike Europe and the United States, spamming remained legal.

Retaining the services of top-level bot masters, Kushnir sent out so much spam that he angered legit system administrators, some of whom took it upon themselves to bombard his English centers with repeated retaliatory DDoS attacks. Even his business phones came under assault after someone posted the centers' phone number on the Web as a contact number for cheap sex services.

Dmitri Alperovitch is a Russian-born American computer security industry executive. He is co-founder and chief technology officer of CrowdStrike. In August 2011, as vice president of threat research at McAfee, he published *Operation Shady RAT*, a report on suspected Chinese intrusions into at least 72 organizations, including defense contractors, businesses worldwide, the United Nations and the International Olympic Committee. Alperovitch is a naturalized American citizen born in Russia who came to the United States in 1994 with his family.

Early life and education

Born in Moscow in the Russian S.F.S.R., a constituent republic of the Soviet Union, Alperovitch is a U.S. citizen. In 1994, his father was granted a visa to Canada, and a year later the family moved to Chattanooga. Alperovitch earned a B.S. in computer science in 2001, and a M.S. in information security in 2003, both from Georgia Institute of Technology. It was the school's first graduate degree in information security.

Career

Alperovitch worked at a number of computer security startups in the late 1990s and early 2000s, including e-mail security startup CipherTrust, where he was one of the leading inventors of the TrustedSource reputation system. Upon acquisition of CipherTrust by Secure Computing in 2006, he led the research team and launched the Software-as-a-Service business for the company. Alperovitch took over as vice president of threat research at McAfee, when the company acquired Secure Computing in 2008.

In January 2010, he led the investigation into Operation Aurora, the Chinese intrusions into Google and two dozen other companies. Subsequently, he led the investigation of Night Dragon espionage operation of the Western multinational oil and gas companies, and traced them to Song Zhiyue, a Chinese national living in Heze City, Shandong Province.

In late 2011, along with entrepreneur George Kurtz and Gregg Marston, Dmitri Alperovitch co-founded and became the chief technology officer of CrowdStrike, a security technology company focused on helping enterprises and governments protect their intellectual property and secrets against cyberespionage and cybercrime.

In 2015 CapitalG (formerly Google Capital), led a $100 million capital drive for CrowdStrike. The firm brought on board senior FBI executives, such as Shawn Henry, former executive assistant director (EAD) of the FBI's Criminal, Cyber, Response and Services Branch, and Steve Chabinsky, former deputy assistant director of the FBI's Cyber Division. By May of 2017, CrowdStrike had received $256 million in funding from Warburg Pincus, Accel Partners, and Google Capital and its stock was valued at just under $1 billion.

[...]

OCT 24, 2016 - Esquire article from VICKY WARD

Source : [HP0001][GDrive]

At six o'clock on the morning of May 6, Dmitri Alperovitch woke up in a Los Angeles hotel to an alarming email.Alperovitch is the thirty-six-year-old cofounder of the cybersecurity Brm CrowdStrike, and late the previous night, his company had been asked by the Democratic National Committee to investigate a possible breach of its network. A CrowdStrike security expert had sent the DNC a proprietary software package, called Falcon, that monitors the networks of its clients in real time. Falcon "lit up," the email said, within ten seconds of being installed at the DNC: Russia was in the network.

Alperovitch, a slight man with a sharp, quick demeanor, called the analyst who had emailed the report. "Are we sure it's Russia?" he asked.

The analyst said there was no doubt. Falcon had detected malicious software, or malware, that was stealing data and sending it to the same servers that had been used in a 2015 attack on the German Bundestag. The code and techniques used against the DNC resembled those from earlier attacks on the White House and the State Department. The analyst, a former intelligence officer, told Alperovitch that Falcon had identiBed not one but two Russian intruders: Cozy Bear, a group CrowdStrike's experts believed was affiliated with the FSB, Russia's answer to the CIA; and Fancy Bear, which they had linked to the GRU, Russian military intelligence.

Alperovitch then called Shawn Henry, a tall, bald Bfty-four-year-old former executive assistant director at the FBI who is now CrowdStrike's president of services. Henry led a forensics team that retraced the hackers' steps and pieced together the pathology of the breach. Over the next two weeks, they learned that Cozy Bear had been stealing emails from the DNC for more than a year. Fancy Bear, on the other hand, had been in the network for only a few weeks. Its target was the DNC research department, speciBcally the material that the committee was compiling on Donald Trump and other Republicans. Meanwhile, a CrowdStrike group called the Overwatch team used Falcon to monitor the hackers, a process known as shoulder-surBng.

Ultimately, the teams decided it was necessary to replace the software on every computer at the DNC. Until the network was clean, secrecy was vital. On the afternoon of Friday, June 10, all DNC employees were instructed to leave their laptops in the office. Alperovitch told me that a few people worried that Hillary Clinton, the presumptive Democratic nominee, was clearing house. "Those poor people thought they were getting Bred," he says.

For the next two days, three CrowdStrike employees worked inside DNC headquarters, replacing the software and setting up new login credentials using what Alperovitch considers to be the most secure means of choosing a password: \ipping through the dictionary at random. (After this article was posted online, Alperovitch noted that the passwords included random characters in addition to the words.) The Overwatch team kept an eye on Falcon to ensure there were no new intrusions. On Sunday night, once the operation was complete, Alperovitch took his team to celebrate at the Brazilian steakhouse Fogo de Chão.

A few people worried that Hillary Clinton, the presumptive Democratic nominee, was clearing house.

Hacking, like domestic abuse, is a crime that tends to induce shame. Companies such as Yahoo usually publicize their breaches only when the law requires it. For this reason, Alperovitch says, he expected that the DNC, too, would want to keep quiet.

By the time of the hack, however, Donald Trump's relationship to Russia had become an issue in the election. The DNC wanted to go public. At the committee's request, Alperovitch and Henry briefed a reporter from The Washington Post about the attack. On June 14, soon after the Post story publicly linked Fancy Bear with the Russian GRU and Cozy Bear with the FSB for the Brst time, Alperovitch published a detailed blog post about the attacks.

Alperovitch told me he was thrilled that the DNC decided to publicize Russia's involvement. "Having a client give us the ability to tell the full story" was a "milestone in the industry," he says. "Not just highlighting a rogue nation-state's actions but explaining what was taken and how and when. These stories are almost never told."

In the Bve years since Alperovitch cofounded CrowdStrike, he and his company have played a critical role in the development of America's cyberdefense policy. Frank Cilluffo, the former special assistant to the president for homeland security, likens Alperovitch to Paul Revere: "Dmitri, as an individual, has played a signiBcant role in elevating cybersecurity policy not only inside the private sector but more generally."

When I met Alperovitch in late September, at his open-plan offices outside Washington, D.C., he explained that CrowdStrike was created to take advantage of a simple but central lesson he'd learned about stopping hackers. It's not enough, he says, to play defense with technology: "Otherwise the adversary will scale up and it becomes a game of numbers, which they will win." Instead, attribution is crucial: First you need to identify the perpetrator, then you need to discover what motivates the crime, and finally—most important—you need to Bgure out how to Bght back.

Before Alperovitch founded CrowdStrike, the idea that attribution ought to be a central defense against hackers was viewed as heresy. In 2011, he was working in Atlanta as the chief threat officer at the antivirus software Brm McAfee. While sifting through server logs in his apartment one night, he discovered evidence of a hacking campaign by the Chinese government. Eventually he learned that the campaign had been going on undetected for Bve years, and that the Chinese had compromised at least seventyone companies and organizations, including thirteen defense contractors, three electronics Brms, and the International Olympic Committee.

That the Chinese government had been stealing information from the private sector was a shock to the security industry and to many U. S. officials. Almost no one thought that foreign governments used the Internet for anything other than old-fashioned espionage. "This was not spy versus spy," says John Carlin, who was until recently the assistant attorney general for national security. The hacking was economic sabotage.

While Alperovitch was writing up his report on the breach, he received a call from Renee James, an executive at Intel, which had recently purchased McAfee. According to Alperovitch, James told him, "Dmitri, Intel has a lot of business in China. You cannot call out China in this report."

Alperovitch removed the word China from his analysis, calling the operation Shady Rat instead. He told me that James's intervention accelerated his plans to leave Intel. (James declined to comment.) He felt that he was "now being censored because I'm working for a company that's not really an American company."

Alperovitch and George Kurtz, a former colleague, founded CrowdStrike as a direct response. The cybersecurity industry at the time, Alperovitch says, was

"terriBed of losing their ability to market products in China." Their new company would push the idea that hacking was a means, not an end. "We saw that no one's really focused on the adversary," Alperovitch told me. "No one's focusing exclusively on how can we actually identify them, attribute them, deter them from taking this action again." CrowdStrike's tagline encapsulated its philosophy: "You don't have a malware problem, you have an adversary problem."

Aperovitch's June 14 blog post garnered so much media attention that even its ebullient author felt slightly overwhelmed. Inevitably there were questions about the strange names his company had given the Russian hackers. As it happened, "Fancy Bear" and "Cozy Bear" were part of a coding system Alperovitch had created. Animals signiBed the hackers' country of origin: Russians were bears, Chinese were pandas, Iranians were kittens, and North Koreans were named for the chollima, a mythical winged horse. By company tradition, the analyst who discovers a new hacker gets to choose the Brst part of the nickname. Cozy Bear got its nickname because the letters coz appeared in its malware code. Fancy Bear, meanwhile, used malware that included the word Sofacy, which reminded the analyst who found it of the Iggy Azalea song "Fancy."

The day after the media maelstrom, the reporters were back with less friendly questions: Had Alperovitch gotten his facts right? Was he certain Russia was behind the DNC hacks? The doubts were prompted by the appearance of a blogger claiming to be from Eastern Europe who called himself Guccifer 2.0. Guccifer said that the breach was his, not Russia's. "DNC'S servers hacked by a lone hacker," he wrote in a blog post that included stolen Bles from the DNC. "I guess CrowdStrike customers should think twice about company's competence," Guccifer wrote. "Fuck CrowdStrike!!!!!!!!!"

Guccifer said that the breach was his, not Russia's

Alperovitch was bewildered. In a career spanning nearly two decades, he had never made an incorrect attribution in public. "Did we miss something?" he asked CrowdStrike's forensics team. Henry and his staff went back over the evidence, all of which supported their original conclusion.

Alperovitch had also never seen someone claim to be the only intruder on a site. "No hacker goes into the network and does a full forensic investigation," he told me. Being called out, he said, was "very shocking. It was clearly an attack on us as well as on the DNC."

Alperovitch initially thought that the leaks were standard espionage and that Guccifer's attacks on CrowdStrike were just a noisy reaction to being busted. "I thought, Okay, they got really upset that they were caught," he said. But after documents from the DNC continued to leak, Alperovitch decided the situation was far worse than that. He concluded that the Russians wanted to use the leaked Bles to manipulate U. S. voters—a Brst. "It hit me that, holy crap, this is an in\uence operation. They're actually trying to inject themselves into the election," he said. "I believe that we may very well wake up on the morning the day after the election and Bnd statements from Russian adversaries saying, 'Do not trust the result.' "

As it turned out, many reporters found Guccifer's leaked documents too cumbersome to sift through, and some were nervous that Bles from the strange website might contain viruses. But on July 22, three days before the Democratic convention in Philadelphia, WikiLeaks dumped a massive cache of emails that had been stolen from the DNC. Unlike the leaks published by Guccifer, these were organized and easily searchable. Reporters soon found emails suggesting that the DNC leadership had favored Hillary Clinton in her primary race against Bernie Sanders, which led Debbie Wasserman Schultz, the DNC chair, along with three other officials, to resign.

Days later, Alperovitch got a call from a Reuters reporter asking whether the Democratic Congressional Campaign Committee had been hacked. CrowdStrike had, in fact, been working on a breach at the DCCC; once again, Alperovitch believed that Russia was responsible. Now, however, he suspected that only Fancy Bear was involved. A lawyer for the DCCC gave Alperovitch permission to conBrm the leak and to name Russia as the suspected author.

Two weeks later, Bles from the DCCC began to appear on Guccifer 2.0's website. This time he released information about Democratic congressional candidates who were running close races in Florida, Ohio, Illinois, and Pennsylvania. On August 12, he went further, publishing a spreadsheet that included the personal email addresses and phone numbers of nearly two hundred Democratic members of Congress.

Alperovitch was in New York when he read about the leak on Twitter. He and Henry were asked to join a conference call with Nancy Pelosi, the House minority leader, and the chair of the DCCC. Pelosi said she'd warned her colleagues to keep their phones away from their grandchildren until they got new numbers, as some members of Congress had already received threatening messages. Alperovitch offered to install Falcon on representatives' computers until the election.

"I remember getting off that call feeling completely outraged," he said. "I called up Shawn. I'm like, 'I can't believe the Russians are getting away with it. These are congresspeople. I can't believe that there's still no response from this government.' "

Alperovitch's friends in government told him privately that an official attribution so close to the election would look political. If the government named Russia, it would be accused of carrying water for Hillary Clinton. The explanations upset Alperovitch. The silence of the American government began to feel both familiar and dangerous. "It doesn't help us if two years from now someone gets indicted," he said. After Michelle Obama's passport was published online, on September 22, Alperovitch threw up his hands in exasperation. "That is Putin giving us the Bnger," he told me.

Dmitri Alperovitch knows a thing or two about what the Russians call "active measures," in which propaganda is used to undermine a target country's political systems. He was born in 1980 in Moscow, in an era when people were afraid to discuss politics even inside their homes. His father, Michael, was a nuclear physicist who barely escaped being sent to Chernobyl as part of a rescue mission in 1986. Many of Michael's close friends and colleagues died of radiation poisoning within months of \ying to the burning power plant. The takeaway for Dmitri was that "life is cheap in the Soviet Union."

Michael also taught Dmitri to code. Without a computer at home, Dmitri practiced by writing down algorithms on paper. In 1990, his father was sent to Maryland as part of a nuclear-safety training program for scientists. Per Soviet custom, Dmitri stayed in the USSR to ensure that his parents didn't defect. He lived with his grandparents, and when his parents returned, after a year, they brought him his Brst computer, an IBM PC.

Without a computer at home, Dmitri practiced by writing down algorithms on paper

In 1994, his father was granted a visa to Canada, and a year later the family moved to Chattanooga, where Michael took a job with the Tennessee Valley Authority. The work was not particularly challenging, so Michael began studying cryptography on the side. While Dmitri was still in high school, he and his father started an encryption-technology business. Dmitri says he loved the beauty of the math but also saw cryptography's fatal \aw: "If someone stole your keys to encrypt the data, it didn't matter how secure the algorithms were."

Alperovitch studied computer science at Georgia Tech and went on to work at an antispam software Brm. There he met a striking dark-haired computer geek named Phyllis Schneck. As a teenager, Schneck once showed her father that she could hack into the company where he worked as an engineer. Appalled, Dr. Schneck made his daughter promise never to do something like that again.

Fighting email spam taught Alperovitch a second crucial lesson. He discovered that every time he blocked a server, the spammers deployed a hundred new

servers to take its place. Alperovitch realized that defense was about psychology, not technology.

To better understand his adversaries, Alperovitch posed as a Russian gangster on spam discussion forums, an experience he wrote up in a series of reports. One day he returned from lunch to a voice mail telling him to call the FBI immediately. He was terriBed. "I was not a citizen yet," he told me.

As it happened, the bureau was interested in his work. The government was slowly waking up to the realization that the Internet was ripe for criminal exploitation: "the great price of the digital age," in John Carlin's words. In 2004, the bureau was hacked by Joseph Colon, a disgruntled IT consultant who gained "god-level" access to FBI Bles. Colon was eventually indicted, but his attack showed the government how vulnerable it was to cybercrime.

In 2005, Alperovitch \ew to Pittsburgh to meet an FBI agent named Keith Mularski, who had been asked to lead an undercover operation against a vast Russian credit-card-theft syndicate. Mularski had no prior experience with the Internet; he relied on Alperovitch, whom he calls "a good guy and a friend," to teach him how to get into the forum and speak the lingo. Mularski's sting operation took two years, but it ultimately brought about Bfty-six arrests.

Alperovitch's Brst big break in cyberdefense came in 2010, while he was at McAfee. The head of cybersecurity at Google told Alperovitch that Gmail accounts belonging to human-rights activists in China had been breached. Google suspected the Chinese government. Alperovitch found that the breach was unprecedented in scale; it affected more than a dozen of McAfee's clients.

Three days after his discovery, Alperovitch was on a plane to Washington. He'd been asked to vet a paragraph in a speech by the secretary of state, Hillary Clinton. She'd decided, for the Brst time, to call out another country for a cyberattack. "In an interconnected world," she said, "an attack on one nation's networks can be an attack on all."

Despite Clinton's announcement, Alperovitch believed that the government, paralyzed by bureaucracy and politics, was still moving too slowly. In 2014, Sony called in CrowdStrike to investigate a breach of its network. The company needed just two hours to identify North Korea as the adversary. Executives at Sony asked Alperovitch to go public with the information immediately, but it took the FBI another three weeks before it conBrmed the attribution.

The delay still frustrates Alperovitch, who saw the long silence as a kind of disinformation. "Yesterday you had no idea. Today you're 100 percent certain. It wasn't credible." From the perspective of the government, however, the handling of the Sony hack was a triumph. "In twenty-six days we Bgured out it was North Korea," John Carlin told me. The attribution changed the focus, he said, from what Sony did wrong to how the government was going to respond to North Korea. As Phyllis Schneck, who now works at the Department of Homeland Security, told me, the government moves slowly because it cannot afford to be wrong: "Vendors like to be Brst. Government must be right."

The government's attitude toward attribution moved closer to Alperovitch's in September 2015, in the run-up to a state visit by Chinese president Xi Jinping. A year earlier, Bve members of the Chinese People's Liberation Army had been indicted by a grand jury in Pennsylvania for stealing economic secrets from the computers of U. S. Brms in the nuclear, solar, and metals industries. Carlin told me that the indictments were meant as "a giant No Trespass sign: Get off our lawn." But the indictment didn't stop the hackers. Alperovitch went on television to call for a stronger response. In April 2015, after President Obama signed an executive order threatening sanctions against the Chinese, Alperovitch received a call from the White House. "You should be happy," he was told. "You're the one who's been pushing for this."

Six months later, just before the state visit, The Washington Post reported that the U. S. was considering making good on the executive order. A senior State Department official told me that Xi did not want to be embarrassed by an awkward visit. The Chinese sent over a negotiating team, and diplomats from both countries stayed up all night working out an agreement. During the state visit, Obama and Xi announced that "neither country's government will conduct or knowingly support cyber-enabled theft of intellectual property" for the purpose of economic espionage. Since then, the Chinese burglaries have slowed dramatically.

This past March, Alperovitch hosted a cyber war game at the Moscone Center in San Francisco. Four teams of ten people—representing the government, the private sector, European and Australian allies, and the hackers—met for two hours to play the game. Shawn Henry; John Carlin; Chris Painter, coordinator for cyber issues at the State Department; and Chris Inglis, the former deputy director of the NSA, were all part of the government team. Executives from JPMorgan Chase and Microsoft represented the private sector. A former member of GCHQ, the British intelligence organization, was on the international team. Frank Cilluffo played a hacker. Ash Carter, the defense secretary, arrived halfway through and asked to play, but the game was already under way, so he was politely turned down.

The game's premise was that ISIS had hacked the databases of several state DMVs and their European counterparts. After a twenty-minute brainstorm, the government team said it was organizing a crisis-response group, speaking to the private sector, and sharing information with the Department of Homeland Security and the FBI. The private team said it was trying to get information from the government. The international team, meanwhile, complained that no one had briefed it—a mistake, Alperovitch said.

The adversary team then stood up and announced, "While the government team is deliberating and talking to the private sector, we're going to kill some people." It was a chilling moment that had real-life echoes for many people in the room. In June 2015, a Kosovar named Ardit Ferizi hacked an online retailer and passed the personal details of more than a thousand U. S. government and military officials to a member of ISIS, who in turn posted them on Twitter. (The ISIS member was later killed by a U. S. drone strike in Syria, and the Kosovar hacker was sentenced to twenty-Bve years in prison.)

The government's reluctance to name the Russians as the authors of the DNC and DCCC hacks made Alperovitch feel that the lessons of the war game—call out your enemy and respond swiftly—had been wasted. He continued to be told by his friends in government that it was politically impossible for the United States to issue an official response to Russia. Some, especially in the State Department, argued that the United States needed Russia's help in Syria and could not afford to ratchet up hostilities. Others said an attribution without a concrete response would be meaningless. Still others insisted that classiBed security concerns demanded consideration.

Alperovitch was deeply frustrated: He thought the government should tell the world what it knew. There is, of course, an element of the personal in his battle cry. "A lot of people who are born here don't appreciate the freedoms we have, the opportunities we have, because they've never had it any other way," he told me. "I have."

"A lot of people who are born here don't appreciate the freedoms we have."

The government's hesitation was soon overtaken by events. During the Brst week of October, while Alperovitch was on a rare vacation, in Italy, Russia pulled out of an arms-reduction pact after being accused by the U. S. of bombing indiscriminately in Syria. The same day, the U. S. halted talks with Russia about a Syrian ceaseBre. On October 7, two days before the second presidential debate, Alperovitch got a phone call from a senior government official alerting him that a statement identifying Russia as the sponsor of the DNC attack would soon be released. (The statement, from the office of the director of

national intelligence and the Department of Homeland Security, appeared later that day.) Once again, Alperovitch was thanked for pushing the government along.

He got the news just after leaving the Sistine Chapel. "It kind of put things in perspective," he told me. Though pleased, he wished the statement had warned that more leaks were likely. "It's nice that you have the DHS and DNI jointly putting the statement out on a Friday night, but the president coming out and saying, 'Mr. Putin, we know you're doing this, we Bnd it unacceptable, and you have to stop' would be beneBcial."

Less than a week later, after WikiLeaks released another cache of hacked emails—this time from John Podesta, Hillary Clinton's campaign chair—the White House announced that the president was considering a "proportional" response against Russia. Administration officials asked Alperovitch to attend a meeting to consider what to do. He was the only native Russian in the room. "You have to let them save face," he told the group. "Escalation will not end well."

2017 article from State of the Nation - "You Won't Believe Who They Really Work For"

Source article : [HW0001][GDrive]

"If someone steals your keys to encrypt the data, it doesn't matter how secure the algorithms are." — Dmitri Alperovitch, founder of CrowdStrike

Russians did not hack the DNC system, a Russian named Dmitri Alperovitch is the hacker and he works for President Obama. In the last five years the Obama administration has turned exclusively to one Russian to solve every major cyber-attack in America, whether the attack was on the U.S. government or a corporation. Only one "super-hero cyber-warrior" seems to "have the codes" to figure out "if" a system was hacked and by "whom."

Dmitri's company, CrowdStrike has been called in by Obama to solve mysterious attacks on many high level government agencies and American corporations, including: German Bundestag, Democratic National Committee, Democratic Congressional Campaign Committee (DCCC), the White House, the State Department, SONY, and many others.

CrowdStrike's philosophy is: *"You don't have a malware problem; you have an adversary problem."*

CrowdStrike has played a critical role in the development of America's cyber-defense policy. Dmitri Alperovitch and George Kurtz, a former head of the FBI cyberwarfare unit founded CrowdStrike. Shawn Henry, former executive assistant director at the FBI is now CrowdStrike's president of services. **The company is crawling with former U.S. intelligence agents.**

Before Alperovitch founded CrowdStrike in 2011, he was working in Atlanta as the chief threat officer at the antivirus software firm McAfee, owned by Intel (a DARPA company). During that time, he "discovered" the Chinese had compromised at least seventy-one companies and organizations, including thirteen defense contractors, three electronics firms, and the International Olympic Committee. **He was the only person to notice the biggest cyberattack in history!** Nothing suspicious about that.

Alperovitch and the DNC

After CrowdStrike was hired as an independent "vendor" by the DNC to investigate a possible cyberattack on their system, Alperovitch sent the DNC a proprietary software package called ***Falcon*** that monitors the networks of its clients in real time. According to Alperovitch, *Falcon* "lit up," within ten seconds of being installed at the DNC. Alperovitch had his "proof" in TEN SECONDS that Russia was in the network. This "alleged" evidence of Russian hacking has yet to be shared with anyone.

As Donald Trump has pointed out, the FBI, the agency that should have been immediately involved in hacking that effects "National Security," has yet to even examine the DNC system to begin an investigation. Instead, the FBI and 16 other U.S. "intelligence" agencies simply "agree" with Obama's most trusted "cyberwarfare" expert Dmitri Alperovitch's "TEN SECOND" assessment that produced no evidence to support the claim.

Also remember that it is only Alperovitch and CrowdStrike that claim to have evidence that it was Russian hackers. In fact, only two hackers were found to have been in the system and were both identified by Alperovitch as Russian FSB (CIA) and the Russian GRU (DoD). It is only Alperovitch who claims that he knows that it is Putin behind these two hackers.

Alperovitch failed to mention in his conclusive "TEN SECOND" assessment that Guccifer 2.0 had already hacked the DNC and made available to the public the documents he hacked – before Alperovitch did his ten second assessment. Alperovitch reported that no other hackers were found, ignoring the fact that Guccifer 2.0 had already hacked and released DNC documents to the public. Alperovitch's assessment also goes directly against Julian Assange's repeated statements that the DNC leaks did not come from the Russians.

The ridiculously fake cyber-attack assessment done by Alperovitch and CrowdStrike naïvely flies in the face of the fact that a DNC insider admitted that he had released the DNC documents. Julian Assange *implied* in an interview that the murdered Democratic National Committee staffer, Seth Rich, was the source of a trove of damaging emails the website posted just days before the party's convention. Seth was on his way to testify about the DNC leaks to the FBI when he was shot dead in the street.

It is also absurd to hear Alperovitch state that the Russian FSB (equivalent to the CIA) had been monitoring the DNC site for over a year and had done nothing. No attack, no theft, and no harm was done to the system by this "false-flag cyber-attack" on the DNC – or at least, Alperovitch "reported" there was an attack. The second hacker, the supposed Russian military (GRU – like the U.S. DoD) hacker, had just entered the system two weeks before and also had done "nothing" but observe.

It is only Alperovitch's word that reports that the Russian FSB was "looking for files on Donald Trump." It is only this false claim that spuriously ties Trump to the "alleged" attack. It is also only Alperovitch who believes that this hack that was supposedly "looking for Trump files" was an attempt to "influence" the election. No files were found about Trump by the second hacker, as we know from Wikileaks and Guccifer 2.0's leaks. To confabulate that "Russian's hacked the DNC to influence the elections" is the claim of one well-known Russian spy. Then, 17 U.S. intelligence agencies unanimously confirm that Alperovitch is correct – **even though there is no evidence and no investigation was ever conducted**.

How does Dmitri Alperovitch have such power? Why did Obama again and again use Alperovitch's company, CrowdStrike, when they have miserably failed to stop further cyber-attacks on the systems they were hired to protect? Why should anyone believe CrowdStrikes false-flag report?

After documents from the DNC continued to leak, and Guccifer 2.0 and Wikileaks made CrowdStrike's report look foolish, Alperovitch decided the situation was far worse than he had reported. **He single-handedly concluded that the Russians were conducting an "influence operation" to help win the election for Trump**. This false assertion had absolutely no evidence to back it up.

On July 22, three days before the Democratic convention in Philadelphia, WikiLeaks dumped a massive cache of emails that had been "stolen" (not hacked) from the DNC. Reporters soon found emails suggesting that the DNC leadership had favored Hillary Clinton in her primary race against Bernie Sanders, which led Debbie Wasserman Schultz, the DNC chair, along with three other officials, to resign.

Just days later, it was discovered that the Democratic Congressional Campaign Committee (DCCC) had been hacked. CrowdStrike was called in again and once again, Alperovitch immediately "believed" that Russia was responsible. A lawyer for the DCCC gave Alperovitch permission to confirm the leak and to name Russia as the suspected author. Two weeks later, files from the DCCC began to appear on Guccifer 2.0's website. This time Guccifer released information about Democratic congressional candidates who were running close races in Florida, Ohio, Illinois, and Pennsylvania. On August 12, Guccifer went further, publishing a spreadsheet that included the personal email addresses and phone numbers of nearly two hundred Democratic members of Congress.

Once again, Guccifer 2.0 proved Alperovitch and CrowdStrike's claims to be grossly incorrect about the hack originating from Russia, with Putin masterminding it all. Nancy Pelosi offered members of Congress Alperovitch's suggestion of installing *Falcon*, the system that failed to stop cyberattacks at the DNC, on all congressional laptops.

Key Point: **Once *Falcon* was installed on the computers of members of the U.S. Congress, CrowdStrike had even further full access into U.S. government accounts.**

Alperovitch's "Unbelievable" History

Dmitri was born in 1980 in Moscow where his father, Michael, was a nuclear physicist, (so Dmitri claims). Dmitri's father was supposedly involved at the highest levels of Russian nuclear science. He also claims that his father taught him to write code as a child.

In 1990, his father was sent to Maryland as part of a nuclear-safety training program for scientists. In 1994, Michael Alperovitch was granted a visa to Canada, and a year later the family moved to Chattanooga, where Michael took a job with the Tennessee Valley Authority.

While Dmitri Alperovitch was still in high school, he and his father started an encryption-technology business. Dmitri studied computer science at Georgia Tech and went on to work at an antispam software firm. It was at this time that he realized that cyber-defense was more about psychology than it was about technology. A very odd thing to conclude.

Dmitri Alperovitch posed as a "Russian gangster" on spam discussion forums which brought his illegal activity to the attention of the FBI – as a criminal. In 2005, Dmitri flew to Pittsburgh to meet an FBI agent named Keith Mularski, who had been asked to lead an undercover operation against a vast Russian credit-card-theft syndicate. Alperovitch worked closely with Mularski's sting operation which took two years, but it ultimately brought about fifty-six arrests. Dmitri Alperovitch then became a pawn of the FBI and CIA.

In 2010, while he was at McAfee, the head of cybersecurity at Google told Dmitri that Gmail accounts belonging to human-rights activists in China had been breached. Google suspected the Chinese government. Alperovitch found that the breach was unprecedented in scale; it affected more than a dozen of McAfee's clients and involved the Chinese government. Three days after his supposed discovery, Alperovitch was on a plane to Washington where he had been asked to vet a paragraph in a speech by the secretary of state, Hillary Clinton.

2014, Sony called in CrowdStrike to investigate a breach of its network. Alperovitch needed just "two hours" to identify North Korea as the adversary. Executives at Sony asked Alperovitch to go public with the information immediately, but it took the FBI another three weeks before it confirmed the attribution.

Alperovitch then developed a list of "usual suspects" who were well-known hackers who had identifiable malware that they commonly used. Many people use the same malware and Alperovitch's obsession with believing he has the only accurate list of hackers in the world is plain idiocy exacerbated by the U.S. government's belief in his nonsense. Alperovitch even speaks like a "nut-case" in his personal Twitters, which generally have absolutely no references to the technology he is supposedly the best at in the entire world.

Dmitri – Front Man for His Father's Russian Espionage Mission

After taking a close look at the disinformation around Dmitri and his father, it is clear to see that **Michael Alperovitch became a CIA operative** during his first visit to America. Upon his return to Russia, he stole the best Russian encryption codes that were used to protect the top-secret work of nuclear physics in which his father is alleged to have been a major player. **Upon surrendering the codes to the CIA when he returned to Canada, the CIA made it possible for a Russian nuclear scientist to become an American citizen overnight and gain a top-secret security clearance to work at the Oakridge plant, one of the most secure and protected nuclear facilities in America**. Only the CIA can transform a Russian into an American with a top-secret clearance overnight.

We can see on Michael Alperovitch's Linked In page that he went from one fantastically top-secret job to the next without a break from the time he entered America. He seemed to be on a career path to work in every major U.S. agency in America. In every job he was hired as the top expert in the field and the leader of the company. All of these jobs after the first one were in cryptology, not nuclear physics. As a matter of fact, Michael became the top expert in America overnight and has stayed the top expert to this day.

Most of the work of cyber-security is creating secure interactions on a non-secure system like the Internet. **The cryptologist who assigns the encryption codes controls the system from that point on**.

11/14/2000 - Video Network, Inc. Closes $66 Million Financing Round,Announces Plans to Change Company Name to Pathfire

http://www.quadranglegroup.com/News/NewsItem.aspx?id=42

Key Strategic Investors Include Enron Broadband Services, Reuters and PanAmSat

New Pathfire Name Reflects Company's Pioneering Applications for Distribution and Management of Digital Media Across Numerous Industries

ATLANTA, GEORGIA, and NEW YORK, NEW YORK, November 14, 2000

Video Networks Inc. (VNI), a leading business-to-business provider of digitized video and related e-commerce applications for the media industry,

announced today that it has closed on a $66 million round of private financing led by Quadrangle Group LLC, a private equity firm specializing in the media and communications industries.

Quadrangle's $20 million investment was the cornerstone of a round of financing that also included several key strategic and financial investors, such as Enron Broadband Services, a subsidiary of Enron Corp. (NYSE: ENE); Halpern Denny & Company; PanAmSat (NASDAQ: SPOT); Reuters; Riggs Capital Partners; and Sand Hill Capital. VNI said that it expects to announce business partnerships with several of its new strategic investors in the near future.

This round of financing included participation by existing high-quality VNI investors, such as Alliance Technology Ventures, AT&T Ventures, Bank of America Capital Investors, Institutional Venture Partners (IVP), Kinetic Ventures, Monarch Capital Partners, Noro-Moseley Partners, UPS Strategic Enterprise Fund and U.S. Venture Partners. Robertson Stephens functioned as VNI's agent for this significant round of financing.

Michael J. Eckert, president and CEO of VNI, said, "We are pleased and gratified that such a large number of blue-chip companies and firms have joined our existing investors in supporting VNI's vision and direction, and we are quite enthusiastic about the significant strategic value they bring. Our ability to secure a lead investor of Quadrangle's stature represents a strong vote of confidence in our employees, and of course in our groundbreaking technology. Through its deep relationships and high regard within the media and communication industries, Quadrangle will be a valuable partner as we continue to build this company."

Joshua L. Steiner, managing principal of Quadrangle, said, "We believe that VNI offers its customers superior service and significant cost-savings. The fact that leading media companies like NBC and Charter Communications rely on VNI for mission-critical solutions gives us great confidence in the company's prospects."

Steven Rattner, managing principal of Quadrangle, said, "Quadrangle's strategy is to focus on high-quality investments in the media and communications industries, and to invest in companies where we can make a difference. We are very excited about this company and its management team, and we look forward to helping VNI increase its product offerings and expand its customer base."

Quadrangle will receive one seat on the VNI Board of Directors and has the right to nominate a second board member, subject to the approval of the other shareholders in this round of financing.

VNI is a leading business-to-business provider of digital media content distribution and management services to the broadcasting and cable industries, with emerging operations in the areas of radio, digital cinema, syndication and streaming content on the Internet. VNI provides a distribution platform and software applications for the delivery and management of digitized video content and has developed unique e-commerce solutions that improve the efficiency of related billing and processing transactions. VNI's customers include major broadcast networks, cable companies, advertising agencies and other leading media companies.

Company to Change Name to "Pathfire," Reflecting Its Continuing Evolution

VNI's decision to change its name to Pathfire reflects a new stage of its development and its unique ability to distribute and manage digital media across numerous segments of the media industry.

The name is meant to evoke the speed and efficiency the company's leading-edge software applications and related networking capabilities bring to the management and exchange of digitized media assets in the cable, broadcast, media and entertainment industries. The company will officially adopt the Pathfire name and will launch an extensive rebranding campaign during the first quarter of 2001.

"We wanted a name that evoked the things we do as a company as well as the unique and dynamic way in which we do them," Eckert said. "Pathfire speaks to our ability to distribute content and also to our ability to surround that content with applications and services that make it more valuable."

Quadrangle Group LLC is an investment firm specializing in the media and communications industries. It was founded in March 2000 by four Managing Directors of Lazard Frères & Co. LLC who have more than 50 years of combined experience in private equity and in media and communications. The firm's advisory board and other investors include many prominent executives of leading media and communications companies.

Tom Engdahl is a rare bird in these parts, and he almost migrated to California.

The CEO of 8-week-old Video Networks Inc. is a veteran entrepreneur, with two successful start-ups on his resume. West Coast venture capitalists, who love backing a proven commodity, wanted to back VNI, but only if he relocated to his native California.

That didn't sit well with the locals here, not to mention Engdahl and his family, comfortably ensconced in Atlanta since 1983. So Engdahl and venture capitalist Stephen Fleming, with the help of several institutions, convinced the investors -- two prestigious West Coast venture funds -- through cajoling and cash that Atlanta could profitably house VNI.

Though his North Atlanta office has little furniture and personnel (the sign outside still reads "Commonwealth Insurance," the previous tenant), Engdahl has secured investments from Fleming's Atlanta-based Alliance Technology Ventures, as well as Institutional Venture Partners (IVP) and U.S. Venture Partners (USVP), both based in Palo Alto, Calif. Rosemont, Ill.-based Comdisco Inc., whose network VNI will use, also has an equity stake in the company.

The total investment is worth about $4.3 million. VNI wants to transmit video digitally through an electronic infrastructure -- not a new idea, but one no one has successfully executed.

After Engdahl left Digital Video Inc. -- his second successful start-up -- in 1995, IVP general partner Geoff Yang offered him a slot as an "entrepreneur in residence" at IVP. Engdahl commuted between Atlanta and Palo Alto for a year, advising potential investors and researching his next opportunity.

Dmitri Alperovitch's story began several years earlier. Dmitri immigrated to America in the 1990s from the Soviet Union while in his mid-teens. His family settled in Chattanooga, Tennessee, which is different in many ways from Russia's capital city Moscow, one of the most populated cities in the world. One thing that served Dmitri well in America was his education in Soviet schools, which emphasized math and science. Dmitri became interested in cybersecurity at a young age. "I started a company with my dad when I was still in high school," he told me in an interview. His father, a nuclear physicist, wasn't able to get a job in nuclear power, given the lack of new plants being built in the U.S. However, he became interested in cryptography. "I got more interested in the security side of cryptography and encryption and realized early on that no matter how good you were mathematically, if someone was able to steal your keys, then the quality of the algorithm didn't matter."

Dmitri attended Georgia Tech and received the school's first graduate degree in information security. He considered himself fortunate to land a job with CipherTrust, an email security company, and expected to work on encryption and cryptography. Instead, the company focused on how to block spam, including phishing attacks, that were being launched through email. "It highlighted how quickly things can deteriorate. We went from 5% of email traffic being spam to 95% in less than 6 months."

Dmitri thinks the malware industry was slow to learn because malware threats evolved less rapidly. At CipherTrust, he gained an appreciation for the importance of gaining intelligence. "I started infiltrating those underground forums where the spammers were talking about their latest capabilities . . . That's something we've leveraged heavily at CrowdStrike, to be an intelligence-driven company, so we can stay one step ahead."

In 2011, George Kurtz, Dmitri Alperovitch and Gregg Marston founded CrowdStrike, and it is now headquartered in Sunnyvale, CA, with a valuation of $3 billion and approximately 1,200 employees. According to CrowdStrike, its customers now include "12 of the 20 Fortune largest global companies, 10 of the 20 largest financial institutions," and many of the largest energy, healthcare providers and technology companies. (CrowdStrike is considering an initial public offering in 2019, according to Reuters.) CrowdStrike is one of 50 current U.S. billion-dollar startups with an immigrant founder, according to research by the National Foundation for American Policy.

Immigrants play a major role in the company. Dmitri Alperovitch is the company's chief technology officer. Alex Ionescu, who was born in Romania, worked in Canada and then immigrated to the U.S., is chief architect and helped design the company's "end-point solution," according to Dmitri. Dr. Sven Krasser, an immigrant from Germany, is CrowdStrike's chief scientist.

From the beginning, the company sought to hire people without the limitation of geographic location, a not uncommon practice in cutting-edge companies and something policymakers should keep in mind when proposing immigration restrictions. Dmitri notes he never even met many of the CrowdStrike's first employees until an "all-hands meeting in New York" weeks after the company started. [...]

2011-05-ijcsi-org-ecc-over-rsa-for-asymmetric-encryption.pdf

● The Top Secret Messenger software was developed by Encryption Software Inc. It encrypts the messages of some of the most popular instant messaging programs today, like ICQ and MSN. It can also be used with e-mail clients such as Microsoft Outlook and Outlook Express to encrypt e-mail messages. This product uses both private and public key cryptosystems, including a 307-bit key for its implementation of the ECC.

"Elliptic curves were proposed for use as the basis for discrete logarithm-based cryptosystems almost 20 years ago, independently by Victor Miller of IBM and Neal Koblitz of the University of Washington . At that time, elliptic curves were already being used in various cryptographic contexts.

Elliptic curves are rich mathematical structures that have shown usefulness in many different types of applications. ECC, like RSA has the role in digital signatures, secure key distribution, and encryption. ECC has the upper hand in the efficiency of algorithm. Some devices have limited processing capacity, storage, power supply, and bandwidth like the newer wireless devices and cellular telephones. When used, efficiency of the resource use is very important in these devices. ECC provides encryption functionality requiring a smaller percentage of the resources required by RSA and other algorithms, so it is used in these types of devices. In most cases, the longer the key length, the more protection that is provided, but ECC can provide the same level of protection with a smaller key size than RSA. Since smaller keys as in ECC require fewer resources of the device to perform the mathematical tasks. ECC cryptosystems use the properties of elliptic curves in their public key systems. The elliptic curves provide ways of constructing groups of elements and specific rules of how the elements within these groups combine. The properties between the groups are used to build cryptographic algorithms."

Authentication Giant VeriSign Hacked Repeatedly in 2010

http://www.nbcnews.com/id/46238590/ns/technology_and_science-security/t/authentication-giant-verisign-hacked-repeatedly/#.XhaY9S2ZMXs

By Matt Liebowitz

Print Font:

Update: VeriSign has released a public statement about the data breach. See below.

VeriSign, the Internet infrastructure company at the heart of the World Wide Web, was hacked repeatedly in 2010 by attackers who stole undisclosed but potentially critical information.

According to a report by Reuters, the previously undisclosed breaches took place in 2010 at the Reston, Va.-based firm, which verifies the integrity of top-level domains including all .com and .net addresses and until recently was one of the largest providers of Secure Sockets Layer (SSL) authentication certificates, used by most financial sites to ensure the legitimacy of sites beginning with "https."

"Oh my God," said Stewart Baker, formerly of the Department of Homeland Security and the National Security Agency, when told by Reuters of the breach. "That could allow people to imitate almost any company on the Net."

VeriSign told Reuters its executives "do not believe these attacks breached the servers that support our Domain Name System network," but it did not rule out the possibility of such an attack.

Compromising a Domain Name System (DNS) server could be catastrophic, as these servers verify that a site's Internet Protocol address — for example, 207.86.128.60 — matches up with what users type in to their browsers, such as "www.securitynewsdaily.com."

If an outside party tampered with a company's DNS servers, especially those as powerful as VeriSign's, that could potentially mean millions of people navigating to sites like Google and Amazon, or to their online banking websites, would actually be landing on spoofed, malicious sites controlled by the perpetrators.

In August 2010, VeriSign sold its authentication-certificate business to security-software giant Symantec. Authentication certificates, also known as SSL certificates, are issued to online retailers and other companies that sell products and provide services online. Those companies use the certificates to verify their identities to Web browsers. For example, an authentication certificate known to belong to Amazon proves to your browser that you're logged into the Amazon website.

Were the information about both the DNS server verification and the authentication certificates to fall into the wrong hands, malicious parties could "spoof" large parts of the Internet and World Wide Web.

"You could create a Bank of America certificate or Google certificate that is trusted by every browser in the world," **Dmitri Alperovitch**, head of Asymmetric Cyber Operations, LLC, and until recently vice president of threat research at Symantec's main rival, McAfee, told Reuters.

The Reuters report did not say if the data breach occurred before or after VeriSign transferred its authentication-certificate business to Symantec. SecurityNewsDaily could not reach VeriSign for comment.

"There is no indication that the 2010 corporate network security breach mentioned by VeriSign, Inc. was related to the acquired SSL product production systems," a Symantec spokeswoman told Reuters.

The VeriSign attacks came to light in a U.S. Securities and Exchange Commission filing in October that followed new SEC guidelines on disclosing security breaches to investors.

ICQ Password Revealer

From: dmitri () ENCRSOFT COM (Dmitri Alperovitch)

Date: Mon, 10 May 1999 09:29:01 -0400

Hi.

A few weeks ago, it was posted that ICQ99 stores the password used to access the ICQ network in plain-text in the .DAT files.

We have written a program that demonstrates this by parsing these .DAT files for password and showing it to the user.

It can be downloaded at http://www.encrsoft.com/products.html#icqpass

Note: The option to save password can be turned off in ICQ's Security & Privacy settings.

Yours truly,

Dmitri Alperovitch

2000 (Aug 24) - Dmitri Alperovitch quoted in Computerworld article "Flaw in Microsoft Hotmail accounts leaves old buddy lists to new users"

Read full article from Computerworld : [HP0001][GDrive]

Microsoft is investigating a complaint that expired Hotmail accounts retain the linked MS Instant Messenger buddy lists, and those lists are available to the next person who registers the same e-mail address on a Hotmail account.

Microsoft spokeswoman Leslie Hui acknowledged the company is aware of the problem, but didn't say for how long, or when the access to supposedly expired buddy lists would be closed off.

*The glitch first came to light more than a year ago, when **Dmitri Alperovitch,** a software developer and part-founder of Encryption Software Inc., left a message at the Bugtraq Web site in which he detailed the programming glitches. He didn't indicate that the possible holes had created any real problems.*

Alperovitch wrote in an e-mail to Computerworld, "I did not receive any official response from Microsoft" after his Bugtraq post last year.

"I first checked it a year ago because I expected Microsoft to learn from the mistakes that ICQ and other early IM developers have made in regards with security. I was left quite disappointed that they repeated the same mistakes that others have made, in regards to not using any kind of encryption and also tying the service so closely to Hotmail, which has been plagued with all kinds of security problems in the recent months, which could have potentially compromised the security of not only users' e-mails, but also their IM contact lists and messages." 2013

https://gvu.gatech.edu/news/georgia-tech-alumni-earn-spots-mit-technology-review-innovators-list

The list honors innovators in five categories: inventors, entrepreneurs, visionaries, humanitarians and pioneers. To compile the list, MIT Technology Review editors solicited nominations, selected fewer than 100 finalists and asked a distinguished panel of judges to score each finalist on the originality and impact of their work. From those scores, editors compiled the final list of 35 innovators.

Dmitri Alperovitch, 32, was recognized in the entrepreneur category for his role in co-founding the security company CrowdStrike, which enables cyber-attack victims to strike back against cyber-espionage.

Vijay Balasubramaniyan, 33, was recognized in the inventor category for developing Pindrop Security, which enables its clients to determine the origins of fraudulent phone calls, including those attempting identity theft.

Julie Kientz, 33, was recognized in the visionary category for her work in using computing tools to help people with sleep disorders and families with autistic children. She now works at the University of Washington, where she directs the Computing for Healthy Living and Learning Lab.

Alperovitch earned a bachelor's degree in computer science in 2001 and a master's in information security in 2003, both at Georgia Tech. Balasubramaniyan earned a doctorate in computer science from Georgia Tech in 2011. Both men completed research at the College of Computing's Information Security Center. Kientz earned her doctorate in computer science in 2008, completing her research in the School of Interactive Computing.

2005 mention - research engineer at Alpharetta and CipherTrust

Domains: E-mail address says lots about you

➤ Continued from F1

label of all — spammer.

Granted, while a large chunk of the nearly 123 million Americans zapping e-mails daily might not care about the label on their correspondence, others are glancing a judgmental eye.

"When I see a Yahoo or Hotmail domain, I think not only cheap, but also disposable and possibly porno, because of the anonymity of those domains," said Elizabeth McDaniel of Athens. "And I think 'dumbo' when I see someone nowadays with an AOL account."

Don't dismiss this as mere electronic snobbery. These e-mail impressions are having consequences users may not even realize.

Some employers are now balking at résumés that are sent from certain e-mail domains because of the stigma attached.

"I'll never hire someone with an AOL.com address," said Peter Shankman, founder of the Geek Factory, a New York City marketing firm that consults for such clients as Yoo-hoo soft drinks and Walt Disney World. "It screams that you're at a very basic stage."

And mighty AOL — which 50 million Americans still rely upon for e-mail exchanges, according to Internet audience measurement service comScore Media Metrix — is far from threatened.

"The thing that is most disconcerting to our members is not the domain names, but what is being sent," said AOL spokesman Nicholas Graham. "There's an immense amount of integrity and trust associated with the AOL.com name. Given the amount we've invested in products and services [spam filters and virus protection], the AOL.com domain name is trusted as much for professional and personal use."

The online giant, however, is fully aware of domain stigma: It offers software that allows its members to block specific domain names from their in boxes.

But what's worth more — credibility or cash?

Free e-mail services such as Hotmail or Yahoo Mail have attracted millions of users. ComScore Media Metrix counts Yahoo Mail as king with almost 63 million unique users as of this March. Hotmail boasts 44 million.

"I think Yahoo Mail has universal appeal," said Yahoo spokeswoman Karen Mahon in Sunnyvale, Calif. "Our users run the gamut from beginning users to business users."

But despite the massive audience, there's an unpleasant rep associated with these names.

> "We wonder at those 'sheep' with other systems and e-mail domains. They are always having problems. Don't they have the intelligence to research and select a more manageable operation?"
> ELIZABETH McDANIEL

And it's often earned.

Dmitri Alperovitch, research engineer at Alpharetta e-mail security and anti-spam vendor CipherTrust, said 2.5 percent of the e-mail sent to his business clients — which arrives from Hotmail, Yahoo and Gmail domains — is a legitimate exchange.

Yet almost 3.3 percent of mail from these addresses is spam.

"Spammers know that a great deal of mail comes from Hotmail or Yahoo, and they intentionally 'spoof' those domains," Alperovitch said, referring to the practice of sending out spam that appears to originate from a legitimate e-mail address.

And although it may save a few pennies, free e-mail addresses and certain providers don't always make the best first impression.

"I believe there is a place for AOL, MSN, Yahoo, in the personal e-mail world," said Richard Arnold, a marketing director for Auto Color Inc. in Marietta, "but not for a business."

Still, it's hard to decline the temptation of a free e-mail address, especially when services such as Gmail and Yahoo are now offering huge amounts of storage. Which has led many to create a near-Rolodex worth of addresses for themselves:

One for friends. One for banking. One for buying. One that's none of your business. And one that just looks cool.

"I have several e-mail addresses because of the stereotypes put on them," said Betsie Smith of Franklin. "When I said I was on Yahoo, people would not respond because just the name meant it was unsafe and too commercial. I use BellSouth Internet when I want not to be looked down upon."

Not all free e-mail accounts are pompously pooh-poohed. Gmail, Google's stab at carving an e-mail niche, has a bit of prestige since an address can only be secured from a personal invite from another user. Slightly more than 3 million Americans now boast a Gmail account.

"Gmail created a cachet that got everybody hot and bothered — a gourmet e-mail address," said Alan Thornton of Decatur, who uses a Gmail address among others.

But when, or if, Gmail becomes available to everyone, its fate could be the same as its other no-cost brethren.

"Anything that's free will eventually be the same," said David Carnoy, executive editor at technology news Web site CNET.com in New York City.

And then there are the elitists, who make no bones about their upscale domain tastes.

"I feel those of us with a mac.com e-mail domain are a little smug," McDaniel said. "We wonder at those 'sheep' with other systems and e-mail domains. They are always having problems. Don't they have the intelligence to research and select a more manageable operation?"

Easy now. Before copping such an attitude, realize that there's also a backlash against such bluster.

Personalized domains, which perhaps offer the greatest air of authenticity to an e-mail recipient, also can elicit the greatest contempt.

Yourname@yourname.com can intimate to some that you're a jerk.

"When I see someone like that it's like, 'Whoa, that person's a little full of themselves,'" Carnoy said. "It's almost like a vanity license plate."

So how does one achieve digital dignity, affordability and simplicity?

Stereotypes, as always, are often shallow and unfair, said Dave Mason of Tucson, Ariz., host of the syndicated radio program "ComputerTalk With Dave Mason."

The only real worth of any e-mail is its content.

"It's judging a book by the cover," Mason said. "You have to be very careful doing that. But you have to make judgments and you filter things out based on what's important."

And many could not care less. Just please . . . no spam.

A domain name "has no significance," said Mike Leibowitz of Roswell. "Just don't send me [e-mail] that asks me to forward it to 47 other people or my legs will fall off."

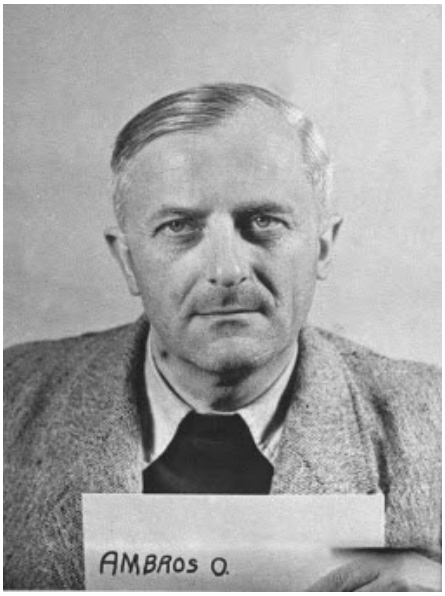
Otto Ambros (born 1901)

Wikipedia Otto Ambros



[HK001B][GDrive]

Born 19 May 1901 Weiden in der Oberpfalz [HK001A][GDrive]

Died 23 July 1990 (aged 89) [HK001A][GDrive]

Saved WIkipedia capture

See [HK001A][GDrive]

Otto Ambros (19 May 1901 – 23 July 1990) was a German chemist and Nazi war criminal, who was involved with the research of chemical nerve agents, especially sarin and tabun. After the end of the war, he was tried at Nuremberg and convicted of crimes against humanity for his use of slave labor from the Auschwitz III–Monowitz concentration camp.

Early life

The son of a university professor, Ambros attended school and passed his Abitur exam in Munich. In 1920 he went to the University of Munich to study chemistry and agricultural science. In 1925 he gained a doctorate, studying under the 1915 Nobel Prize for Chemistry winner, Richard Willstätter.

Career

Beginning in 1926, Ambros worked at BASF in Ludwigshafen. In 1930 he spent a year studying in The Far East.

From 1934 he worked at IG Farben, becoming head of their Schkopau plant in 1935. His division of IG Farben developed chemical weapons, including the nerve agents sarin (in 1938) and soman (in 1944). In this capacity, he was an advisor to Carl Krauch, a company executive.

Ambros then managed the IG Farben factories at Dyhernfurth, which produced tabun (a nerve agent similar to sarin), and at Gendorf, which produced mustard gas (a poison gas originally developed and used in World War I). The Dyhernfurth factory included a slave labor concentration camp with about 3000 prisoners (needs citation, too vague) who were used for the most hard and dangerous work at the plant, and as human guinea pigs in nerve gas experiments.

In 1944 Ambros was awarded the Knight's Cross of War Merit Cross.

Monowitz

IG Farben plant at Monowitz under construction approximately 10 kilometres (6.2 mi) from Auschwitz, 1942

Concentration camp prisoners, identified by striped clothes at work in Monowitz

Ambros was arrested by the US Army in 1946. He had overseen the IG Buna Werke rubber plant at Monowitz in the Auschwitz complex. At the IG Farben trial in Nuremberg in 1948 he was sentenced to eight years' confinement, and was ultimately released from Landsberg Prison early in 1952. The extensive works were to have produced (WIKI) Buna rubber, or (WIKI) polybutadiene for use in rubber tyres. Monowitz was built as an Arbeitslager (workcamp); it also contained an "Arbeitsausbildungslager" (Labor Education Camp) for non-Jewish prisoners perceived not up to par with German work standards. It held approximately 12,000 prisoners, the great majority of whom were Jewish, in addition to non-Jewish criminals and political prisoners. Prisoners from Monowitz were leased out by the SS to IG Farben to labor at the Buna Werke, a collection of chemical factories including those used to manufacture Buna (synthetic rubber) and synthetic oil. The SS charged IG Farben three Reichsmarks (RM) per day for unskilled workers, four (RM) per hour for skilled workers, and one and one-half (RM) for children. By 1942 the new labour camp complex for IG Farben prisoners occupied about half of its projected area, the expansion was for the most part finished in the summer of 1943. The last 4 barracks were built a year later. The labour camp's population grew from 3,500 in December 1942 to over 6,000 by the first half of 1943. By July 1944 the prisoner population was over 11,000, most of whom were Jews. Despite the growing death-rate from slave labour, starvation, executions or other forms of murder, the demand for labour was growing, and more prisoners were brought in. Because the factory management insisted on removing sick and exhausted prisoners from Monowitz, people incapable of continuing their work were murdered at the death camp at Birkenau nearby. The company argued that they had not spent large amounts of money building barracks for prisoners unfit to work.

Release from prison

After his release, he became an adviser to chemical companies such as W. R. Grace and Company , (WIKI) Dow Chemical, as well as the U.S. Army (WIKI) Chemical Corps, and (WIKI) Konrad Adenauer.

He was also advising *Chemie Grünenthal* (now *Grünenthal GmbH*) in the development of thalidomide.

Book - "Operation Paperclip"

Source - [HB0020][GDrive]

[...] In 1998, Congress passed the Nazi War Crimes Disclosure Act, which required various U.S. government agencies to identify and release federal records relating to Nazi war criminals that had been kept classified for decades. In accordance with the act, President Clinton established an Interagency Working Group-made up of federal agency representatives and members of the public to oversee the interpretation of over eight million pages of U.S. government records and report its findings to Congress. The documentation revealed a vast web of profitable relationships between hundreds of Nazi war criminals and U.S. military and intelligence agencies.

In 2005, in a final report to Congress, U.S. Intelligence and the Nazis, the Interagency Working Group determined that "[t]he notion that they [the U.S. military and the CIA] employed only a few 'bad apples' will not stand up to the new documentation." In hindsight, wrote the Interagency Working Group, the government's use of Nazis was a very bad idea, and "there was no compelling reason to begin the postwar era with the assistance of some of those associated with the worst crimes of the war." And yet history now shows us that that is exactly what the American government did – and continued to do throughout the Cold War.

In the decades since Operation Paperclip ended, new facts continue to come to light. In 2008, previously unreported information about Otto Ambros emerged, serving as a reminder that the story of what lies hidden behind America's Nazi scientist program is not complete.

*A group of medical doctors and researchers in England, working on behalf of an organization called the **Thalidomide Trust**, believe they have tied the wartime work of **IG Farben** and **Otto Ambros** to the **thalidomide tragedy** of the late 1950s and early 1960s. After Ambros was released from Landsberg Prison, he worked as an economic consultant to **German chancellor Konrad Adenauer** and to the industrial magnate **Friedrich Flick**, the richest person in Germany during the Cold War. Like Ambros, Flick had been tried and convicted at Nuremberg, then released early by John J. McCloy.*

*In the late 1950s, Ambros was also elected chairman of the advisory committee for a German company called **Chemie Grünenthal**. Grünenthal was about to market a new tranquilizer that promised pregnant women relief from morning sickness. The drug, called thalidomide, was going to be sold under the brand name Contergan. Otto Ambros served on the board of directors of Grünenthal. In the late 1950s, very few people knew that Grünenthal Was a safe haven for many Nazis, including Dr. Ernst-Gunther Schenck, the inspector of nutrition for the SS, and Dr. Heinz Baumkotter, an SS captain (Hauptsturmfiihrer) and the chief concentration camp doctor in Mauthausen, Natzweiler-Struthof, and Sachsenhausen concentration camps.*

*Ten months before **Grünenthal**'s public release of thalidomide, the wife of a **Grünenthal** employee, who took the drug to combat morning sickness, gave birth to a baby without ears. No one linked the birth defect to the drug, and thalidomide was released by the company. After several months on the market, in 1959, **Grünenthal** received its first reports that thalidomide caused polyneuropathy, or nerve damage, in the hands and feet of elderly people who took the drug. The drug's over-the-counter status was changed so that it now required a prescription. Still, thalidomide was marketed aggressively in forty-six countries with a label that stated it could be " given with complete safety to pregnant women and nursing mothers without any adverse effect on mother and child." Instead, the drug resulted in more than ten thousand mothers giving birth to babies with terrible deformities, creating the most horrific pharmaceutical disaster in the history of modern medicine. Many of the children were born without ears, arms, or legs and with reptilian, flipperlike appendages in place of healthy limbs.*

*The origins of thalidomide were never accounted for. Grünenthal had always maintained that it lost its documents that showed where and when the first human trials were conducted on the drug. Then, in 2008, the Thalidomide Trust, in England, headed by Dr. Martin Johnson, located a group of Nazi-era documents that produced a link between thalidomide and the drugs researched and developed by IG Farben chemists during the war. Dr. Johnson points out that Grünenthal's 1954 patents for thalidomide cryptically state that human trials had already been completed, but the company says it cannot offer that data because it was lost, ostensibly during the war. **"The patents suggest that thalidomide was probably one of a number of products developed at Dyhernfurth or Auschwitz-Monowitz under the leadership of Otto Ambros in the course of nerve gas research,"** Dr. Johnson says.*

The Thalidomide Trust also links Paperclip scientist Richard Kuhn to the medical tragedy. "Kuhn worked with a wide range of chemicals in his nerve gas research, and in his antidote research we know he used Antergan, which are fairly sure was a 'sister drug' to Contergan," the brand name for thalidomide, Dr. Johnson explains.

[...] It seems that the legacy of Hitler's chemists has yet to be fully unveiled. Because so many of these German scientists were seen as assets to the U.S. Army Chemical Corps' nerve agent programs, and were thus wanted as participants in Operation Paperclip, secret deals were made, and the many documents pertaining to these arrangements were classified. President Clinton's Interagency Working Group had access to eight million pages of declassified documents, but millions more documents remain classified. In U.S. Intelligence and the Nazis, the Interagency Working Group's authors Write that " the truest reckoning with the official past can never be complete without the full release of government records."

*Part of the problem lies in identifying where records are physically located. For example, a 2012 FOIA request to the State Department, asking for the release of all files related to Otto Ambros, was denied on the grounds that no such files exist. But it is a matter of record; owing to a May 1971 news article in the "Jewish Telegraphic Agency", that Otto Ambros traveled to the United States twice with the State Departments assistance, despite his status as a convicted war criminal. In an interview with State Department official Fred Scott, the Jewish Telegraph1c Agency learned "Ambros came to the United States in 1967 after the State Department recommended to the Justice Department a waiver on his eligibility, which was granted" and that in 1969, Ambros received a second visa waiver and traveled to the United States again. In the spring o 1971 Ambros was attempting to get a third visa waiver from the State Department when the Jewish Telegraphic Agency reported the story. **According to Fred Scott, Ambros's host for his May 1971 visit was listed as the Dow Chemical Company.** After the story was published, Jewish groups held protests, and Ambros allegedly canceled his trip. But none of this information is contained in Ambros's declassified U.S. Army files, FBI files, or CIA files. Otto Ambros was a convicted Nazi war criminal. In accordance with the Nazi War Crimes Disclosure Act, all files about him should have been released and declassified. But records that cannot be located cannot be declassified. [...]*

Otto Ambros lived until 1990, to the age of ninety-two. After his death, the chemical conglomerate BASF, on whose board of directors he had served, lauded him as " an expressive entrepreneurial figure of great charisma." [...]

Source - [HX000K][GDrive]

As I read your book I started thinking about the various Nazi genre films such as; The Boys from Brazil, The Odessa File, and Marathon Man — they all hold to a similar premise, key Nazi's escape Germany after the war and plot in various ways to do bad things. Apparently truth is stranger than fiction. What was Operation Paperclip?

Operation Paperclip was a classified program to bring Nazi scientists to America right after World War II. It had, however, a benign public face. The war department had issued a press release saying that good German scientists would be coming to America to help out in our scientific endeavors.

But it was not benign at all, as seen in the character of Otto Ambros, a man, as you explain, was keen on helping U.S. soldiers in matters of hygiene by offering them soap, this soon after they had conquered Germany. Who was Ambros?

Otto Ambros I must say was one of the most dark-hearted characters that I wrote about in this book. He was Hitler's favorite chemist, and I don't say that lightly. I found a document in the National Archives, I don't believe it had ever been revealed before, that showed that during the war Hitler gave Ambros a one million Reichsmark bonus for his scientific acumen. ***The reason was two-fold. Ambros worked on the Reich's secret nerve agent program, but he also invented synthetic rubber, that was called buna. The reason rubber was so important — if you think about the Reich's war-machine and how tanks need treads, aircraft need wheels — the Reich needed rubber. By inventing synthetic rubber, Ambros became Hitler's favorite chemist.***

Not only that when the Reich decided to develop a factory at Auschwitz, — the death camp had a third territory, there was Auschwitz, there was Birkenau — they did it in a third territory called Auschwitz III also known as ***Monowitvz-Buna****. This was where synthetic rubber was going to be manufactured using prisoners who would be spared the gas chamber as they were put to work, and most often worked to death by the Reich war machine. The person, the general manager there at Auschwitz III, was Otto Ambros. Ambros was one of the last individuals to leave Auschwitz, this is in the last days of January 1945 as the Russians are about to liberate the death camp.* ***Ambros is there according to these documents I have located in Germany, destroying evidence right up until the very end.***

After the war, Ambros was sought by the Allies and later found, interrogated and put on trial at Nuremberg, where he was convicted of mass-murder and slavery. He was sentenced to prison, but in the early 1950s as the Cold War became elevated ***he was given clemency by the U.S. High Commissioner John McCloy*** *and released from prison. When he was sentenced, the Nuremberg judges took away all his finances, including that one million Reichsmark bonus from Hitler. When McCloy gave him clemency he also restored Otto Ambros' finances, so he got back what was left of that money.* ***He was then given a contract with the U.S. Department of Energy.***

He actually came to work in the United States?

Otto Ambros remains one of the most difficult cases to crack in terms of Paperclip. While I was able to unearth some new and horrifying information about his postwar life, most of it remains, "lost or missing," which I take to mean classified. We do know for a fact that Ambros came to the United States two, possibly three times. As a convicted war criminal traveling to the United States he would have needed special papers from the U.S. State Department. The State Department, however, informed me through the Freedom of Information Act that those documents are lost or missing.

NY Times article

See [HN00MM][GDrive]

The release of the nerve gas sarin in the Tokyo subway system has unleashed another possible weapon for any terrorists, but segments of the press have credited (or blamed) the Nazis for development of sarin and its mate, tabun. Such is incorrect, for tabun was publicized as early as 1902, as was sarin, and I. G. Farbenindustrie patented tabun in 1937 and sarin in 1938.

The Nazi regime merely refined these two nerve gases. In Tokyo, diluting chemicals must have been used, otherwise the death rate would have been in the thousands with many more thousands sickened.

By the fall of 1944 the unholy trio of Martin Bormann, Josef Goebbels and Robert Ley had pressured Hitler to use tabun on enemy cities and other installations. In May 1943 the same three urged its use on the Russian front after the Nazi debacle of Stalingrad.

In a conference in Hitler's East Prussian headquarters, Hitler learned that Albert Speer was opposed to the use of tabun against the Allies. ***Otto Ambros, a member of I. G. Farben's managing board and expert on poison gas and synthetic rubber, reminded Hitler that the Allies had a greater capacity to produce mustard gas and access to ethylene, its source from petroleum.***

Otto Ambros also warned Hitler that if Germany used tabun, the Allies could produce this gas in much greater quantities. Hearing this discouraging report from an expert, Hitler abruptly left the conference, but insisted that research be continued on sarin, which was coded "N-Stoff" as a closely guarded military secret, and ordered testing transferred from Army Ordnance to the SS.

When the nerve gas subject came up again in the fall of 1944, Hitler was told by Ambros that nothing had changed from his 1943 views, and Hitler again forbade its use against the Allies. But in February 1945 Speer conceived the idea of using tabun to kill Hitler by introducing it into the ventilating system of the Berlin Fuhrerbunker, but technical problems nullified that scheme.

After the war Ambros's estimate of the Allied chemical warfare capability proved wrong, ironically, for either gas might have altered the course of the war if Hitler had authorized the use of sarin or tabun.

Also, after the war, it was alleged that Farben's poison gases were used on inmates of concentration camps. R. H. HODGES Pelham, N.Y., March 21, 1995 The writer is a longtime researcher into the Nazi regime.

Subsidiaries

Montreal Locomotive Works

Rogers Locomotive Works

The **American Locomotive Company** (often shortened to **ALCO**, **ALCo** or **Alco**) was an American manufacturer that built locomotives, diesel generators, steel and tanks. The company was formed in 1901 by the merger of Schenectady Locomotive Engine Manufactory of Schenectady, New York, with seven smaller locomotive manufacturers. The American Locomotive Automobile Company subsidiary designed and manufactured automobiles under the Alco brand from 1905 to 1913 and produced nuclear energy from 1954 to 1962.

The company changed its name to **Alco Products, Incorporated** in 1955. In 1964, the Worthington Corporation acquired the company. The company went out of business in 1969.

Foundation and early history

The plant in 1906

The company was created in 1901 from the merger of seven smaller locomotive manufacturers with Schenectady Locomotive Engine Manufactory of Schenectady, New York:[1][2]

- Brooks Locomotive Works in Dunkirk, New York
- Cooke Locomotive and Machine Works in Paterson, New Jersey
- Dickson Manufacturing Company in Scranton, Pennsylvania
- Manchester Locomotive Works in Manchester, New Hampshire
- Pittsburgh Locomotive and Car Works in Pittsburgh, Pennsylvania
- Rhode Island Locomotive Works in Providence, Rhode Island

- Richmond Locomotive Works in Richmond, Virginia

The newly formed company was headquartered in Schenectady, New York.[2] Samuel R. Callaway left the presidency of the New York Central Railroad to become president of Alco.[3] When Callaway died on June 1, 1904,[4] Albert J. Pitkin succeeded him as president of Alco.[5]

In 1904, the American Locomotive Company acquired control of the Locomotive and Machine Company of Montreal, Quebec, Canada; this company was eventually renamed the Montreal Locomotive Works. In 1905, Alco purchased Rogers Locomotive Works of Paterson, New Jersey, the second largest locomotive manufacturer in the United States behind Baldwin Locomotive Works.[2]

In the post World War II period, Alco operated manufacturing plants only in Schenectady and Montreal, having closed all the others. After the American Locomotive Company ceased locomotive manufacturing in the United States in 1969, Montreal Locomotive Works continued to manufacture locomotives based on Alco designs.

Steam locomotives

Milwaukee Road 261, a 1944 American 4-8-4 steam locomotive

Alco was the second-largest steam locomotive builder in the United States (after Baldwin Locomotive Works), producing over 75,000 locomotives (though not all were steam, since, unlike Baldwin, Alco transitioned more readily to Diesel). Among these were a large number of well-known locomotives. Railroads that favored Alco products included the Delaware & Hudson Railway, the New York, New Haven & Hartford Railroad, the New York Central Railroad, the Union Pacific Railroad and the Milwaukee Road. Alco was known for its steam locomotives of which the 4-6-4 Hudson, 4-8-2 Mohawk and the 4-8-4 Niagara built for the New York Central and the 4-8-4 FEF and the 4-6-6-4 (Challenger) built for the Union Pacific were fine examples. Alco built many of the biggest locomotives ever constructed, including Union Pacific's *Big Boy* (4-8-8-4). Alco also built the fastest American locomotives, the Class A Atlantic and Class F7 Hudson streamliners for the Milwaukee Road's *Twin Cities Hiawatha* run. Among the ambitious state-of-the-art designs of the late steam era, Alco's Challengers, Big Boys and high speed streamliners stood out for their in-service success.

American No 75214 Tr2 1319 at the Finnish Railway Museum

Other than the Delaware & Hudson's application of SKF roller bearings to the drivers, main and side rods of their own 4-6-2 locomotives in 1924 (the world's first), Alco built the first production steam locomotive in North America to use roller bearings: Timken 1111, a 4-8-4 commissioned in 1930 by Timken Roller Bearing Company was used for 100,000 miles (160,000 km) on fifteen major United States railroads before it was purchased in 1933 by the Northern Pacific Railway. (The Northern Pacific renumbered the *Four Aces* to No. 2626 and ran it on the *North Coast Limited*, as well as its pool trains between Seattle, Washington, and Portland, Oregon, and excursions, through 1957.)

Narrow gauge Alco locomotive built for the military service behind the trenches of World War I

During World War II, Alco produced many 2-10-0 Decapods for the USSR. Many of these were undelivered at the end of the war, and ten of these were sold to Finland in 1947. One, Alco builder's No. 75214, is preserved at the Finnish Railway Museum.[6]

Though the dual-service 4-8-4 steam locomotive had shown great promise, 1948 was the last year that steam locomotives were manufactured in Schenectady. These were the seven A-2a class 9400-series Pittsburgh & Lake Erie Railroad 2-8-4 "Berkshires." Their tenders had to be subcontracted to Lima Locomotive Works, as Alco's tender shop had been closed. The building was converted to diesel locomotive manufacture, to compete with locomotives manufactured by the automobile industry.[7]

Joseph Burroughs Ennis (1879–1955) was a senior vice president between 1917 and 1947 and was responsible for the design of many of the locomotives manufactured.

Alco automobiles

The company diversified into the automobile business in 1906, producing French Berliet designs under license. Production was located at Alco's Rhode Island Locomotive Works in Providence, Rhode Island. Two years later, the Berliet license was abandoned, and the company began to produce its own designs instead. An Alco racing car won the Vanderbilt Cup in both 1909 and 1910 and competed in the first Indianapolis 500 in 1911, driven on all three occasions by Harry Grant. But, ALCO's automotive venture was unprofitable, and they abandoned automobile manufacture in 1913.[8] The Alco automobile story is notable chiefly as a step in the automotive career of Walter P. Chrysler, who worked as the plant manager. In 1911 he left Alco for Buick in Detroit, Michigan, where he subsequently founded the Chrysler Corporation in 1925.

Electric Locomotives

Alco made 60-ton center cab electric freight motors from 1912 through the 1920s for electric railway lines in Oregon. [9]

Diesel-electric locomotives

For a list of Alco diesel locomotive models, see List of ALCO diesel locomotives.

Alco RSD-16 used for freight services in Argentina, 1999.

Although strongly committed to the steam locomotive, ALCo produced the first commercially successful diesel-electric switch engine in 1924 in a consortium with General Electric (electrical equipment) and Ingersoll-Rand (diesel engine). This locomotive was sold to the Central Railroad of New Jersey. It built additional locomotives for a number of railroads, including the Long Island Rail Road and the Chicago and North Western Railway.

The company bought the McIntosh & Seymour Diesel Engine Company in 1929 and henceforth produced its own diesel engines. Its electrical equipment was always from GE. The diesel program was largely overseen by Perry T. Egbert, vice president in charge of diesel locomotive sales and later president of the

company.[10] In the early to middle 1930s, ALCo was the pre-eminent builder of diesel-electric switch engines in the United States but the Electro-Motive Corporation was expanding the realm of diesel power to mainline service, first with custom streamliner trainsets then with production design locomotives for passenger, then freight service. ALCo provided motive power for the Rebel streamliners in 1935 but remained focused on low power applications while General Motors (owner of EMC) was developing reliable diesel power for full-size mainline trains. In 1939, ALCo started production of passenger diesel locomotives to compete with those produced by EMC. The following year, ALCo entered into a partnership with General Electric (Alco-GE), for much-needed support in their efforts to compete with EMC. In 1941 ALCo introduced the RS-1, the first road-switcher locomotive. The versatile road-switcher design gained favor for short-haul applications, which would provide ALCo a secure market niche through the 1940s. The entry of the United States into World War II froze ALCo's development of road diesel locomotives. During that time, ALCo was allocated the construction of diesel switching locomotives, their new road-switcher locomotives, a small quantity of ALCO DL-109 dual-service engines and its proven steam designs, while EMD (formerly EMC) was allocated the construction of mainline road freight diesels (the production of straight passenger-service engines was prohibited by the War Production Board). The postwar era saw ALCo's steam products fall out of favor while they struggled to develop mainline diesel locomotives competitive with EMD's E and F series road locomotives, which were well positioned from GM-EMC's large development efforts of the 1930s and their established service infrastructure. ALCo would prove unable to overcome that lead.

An ALCO S-1 diesel switcher at the Mid-Continent Railway Museum, North Freedom, Wisconsin

Alco's revolutionary RS-1 roadswitcher was selected by the United States Army for a vital task. ALCo ranked 34th among United States corporations in the value of wartime production contracts.[11] The Kriegsmarine's capital ships, led by the Tirpitz, and the Luftwaffe were threatening Allied shipping to the Soviet Union at the port of Murmansk from bases in Norway. This was, at the time, the Soviet lifeline. Thanks to successes in Africa, the U.S. was able to rehabilitate the Trans-Iranian Railway and extend it to the USSR. They chose as locomotives the RSD-1, a six-axle, six traction motor variant of the light ALCo RS-1. Not only was the company prevented from selling these locomotives to mainline U.S. railroads, the thirteen RS-1s that had already been built were commandeered for Iranian duty and converted to RSD-1.[7]

ALCO wordmark recreation

In 1946, ALCo controlled 26% of the diesel locomotive market.[10] The ubiquitous S series (660 and 1000 horsepower) switchers and RS series (1000 and 1500 horsepower) road switchers represented ALCo well during the late 1940s. Much of their success in this period can be tied to their pioneering RS locomotives, representing the first modern road-switcher, a configuration which has long outlasted ALCo. The success of their switcher and road-switcher locomotives was not matched with the PA and FA-type mainline units, however. The 244 engine, developed in a crash program to compete with the power available with EMD's 567 engine, proved unreliable and sales of ALCo's mainline units soon went into decline. In 1948 ALCo-GE produced a prototype gas turbine-electric locomotive, a play to address the concerns of operators such as Union Pacific who sought to minimize the number of locomotive units needed for large power requirements. In 1949, ALCo embarked on a clean-sheet design project to replace the 244. 1949 also saw the introduction of the EMD GP7 road-switcher, a direct challenge in ALCo's bread-and-butter market.

In 1953, General Electric, dissatisfied with the dilatory pace of ALCo's efforts to develop a replacement for the troubled 244 engine, dissolved their partnership with ALCo and took over the gas turbine-electric venture that had started series production the previous year. In 1956 ALCo made long-overdue changes, modernizing their production process and introducing road locomotives with their new 251 engine. However, the benefits to ALCo were negated by bad timing; the market for locomotives was declining after the height of the dieselization era and EMD's GP9 was on the market as a proven competitor backed by a service infrastructure that ALCo, since the dissolution of the GE partnership, lacked. Sales were disappointing and ALCo's profitability suffered.[10] GE entered the export road diesel locomotive market in 1956. GE introduced their newest locomotive to the domestic market in 1960, quickly took the number two position from ALCo, and eventually eclipsed EMD in overall production. Despite continual innovation in its designs (the first AC/DC transmission among others), ALCo gradually succumbed to its competition, in which its former ally, General Electric, was an important element. A new line of Century locomotives including the 630 (the first AC/DC transmission), the 430 and the 636, the first 3,600 horsepower (2.7 MW) locomotive, failed to keep the enterprise going. Third place in the market proved to be an impossible position; ALCo products had neither the market position or reputation for reliability of EMD's products, nor the financing muscle and customer support of GE. It could not earn enough profits. In the late 1960s Alco gradually ceased locomotive production, shipping its last two locomotives, a pair of T-6 switchers to the Newburgh & South Shore Railroad (#1016 and #1017) in January 1969.[7] ALCo closed its Schenectady locomotive plant later that year, and sold its designs to the Montreal Locomotive Works in Canada.

Diversification

Alco diversified into areas other than automobiles with greater success. During World War II, Alco built munitions for the war effort, in addition to locomotive production; this continued throughout the Korean War. After the Korean War, Alco entered the oil production equipment and nuclear power plant markets. With the latter, it began to manufacture heat exchangers for nuclear plants.

In 1955, the company was renamed Alco Products, Incorporated. By this stage locomotive production only accounted for 20% of the business.[12][13]

A complete nuclear power plant, the PM-2A, was built for the Army Nuclear Power Program in 1960.

Purchase and division

The company was purchased in 1964 by the Worthington Corporation, which merged with the Studebaker corporation in 1967 to form Studebaker-Worthington, Inc. (SWI), Alco remaining a wholly owned subsidiary.[14] Former divisions of Alco became semi-independent subsidiaries in 1968.

After the termination of locomotive production in 1969, the locomotive designs (but not the engine development rights) were transferred to the Montreal Locomotive Works, which continued their manufacture. The diesel engine business was sold to White Motor Corporation in 1970, which developed White Industrial Power. In 1977 White Industrial Power was sold to the British The General Electric Company plc (GEC) which renamed the unit Alco Power, Inc. The business was subsequently sold to the Fairbanks-Morse corporation, which continues to manufacture Alco-designed engines in addition to their own design.

The heat exchanger business continued as Alco Products, Inc. for a time. At some later point, some of the heat exchanger products were manufactured by the Alco Products Division of Smithco Engineering, Inc. in Tulsa, Oklahoma (Smithco). In January 1983, certain assets of the Alco Products Division of Smithco, namely double-pipe and hairpin-type heat exchanger products sold under the "Alco Twin" name, mark and style, were sold in an asset sale by Smithco to Bos-Hatten, Inc., a subsidiary of Nitram Energy, Inc. (Nitram). Following the sale of these assets, Smithco remained in business, manufacturing other heat exchange products. In 1985, the assets acquired from Smithco were assigned by Bos-Hatten, Inc. to its parent, Nitram. In 2008, Nitram was acquired by

exchange products. In 1988, the assets acquired from Smiths were assigned by Bob Hatten, then to its parent, Nitrum. In 2008, Nitrum was acquired by Peerless Mfg. Co.[15] In 2015, Peerless sold its heat exchanger business to Koch Heat Transfer Co.[16]

Epilogue

ALCO 251 engine used as a backup generator at a wastewater plant in Montreal

After the closure of Alco's Schenectady works, locomotives to Alco designs continued to be manufactured in Canada by Montreal Locomotive Works and in Australia by AE Goodwin. In addition, Alco-derived locomotives form the major chunk of diesel power on the Indian Railways. Many thousands of locomotives with Alco lineage are in regular mainline use everywhere in India, and around 100 new locos are added every year.

Most of these locomotives are built by the Diesel Locomotive Works (DLW), located at Varanasi, India. The Diesel Loco Modernisation Works (DMW) at Patiala, India, do mid-life rebuilding and upgrading the power of these locomotives, typically the 2,600 horsepower (1.94 MW) WDM-2 to 3,100 horsepower (2.31 MW). *See also: Indian locomotives*.

Alco DL537 metre gauge locomotive of the Hellenic Railways Organisation at Corinth Old Railway Station, Greece.

A number of Alco and MLW diesel-electric locomotives (models DL500C, DL532B, DL537, DL543, MX627 and MX636) are in daily use hauling freight trains of the Hellenic Railways Organisation (OSE) in Greece. The oldest of them (class A.201, DL532B) were delivered to the former Hellenic State Railways (SEK) in 1962. In addition to a variety of standard gauge locomotives, the fleet includes 11 metre gauge Alco locomotives, mainly used for departmental trains in the Peloponnese network. The MX627 and MX636 locomotives have been extensively rebuilt at Piraeus Central Factory of OSE. The remaining Alco locomotives are also being rebuilt, starting with models DL532B and DL537.

The ALCO 251 diesel engine is still manufactured by Fairbanks-Morse of Beloit, Wisconsin, a company which also manufactured diesel locomotives. Additionally, Alco diesel engines are used to power the NASA Crawler Transporter.[17]

Alco and MLW locomotives still work on many regional and tourist railroads across the United States and Canada, including the Delaware-Lackawanna Railroad in Scranton, Pennsylvania, the Catskill Mountain Railroad in Kingston and Phoenecia; the Livonia, Avon and Lakeville Railroad family of lines based in Lakeville, New York, the Lake Whatcom Railway in Wickersham, Washington and the Middletown & Hummelstown Railroad in Middletown, Pennsylvania. The latter owns one of the last true ALCO switchers ever built, #1016. The 1016 is a T-6 type switcher engine. This and ALCO sister 151 (ex Western Maryland Railway S-6) provide daily service in Middletown. Two original Alco RS-2's that were delivered to the Nevada Northern Railway are still in operation.

ALCO-Cooke 2-8-0 #18, built in 1920, survives in passenger service on the Arcade & Attica Railroad in Arcade, New York. It returned to service in May 2009 after a six-year overhaul to bring it into compliance with the FRA's new steam locomotive regulations.

Great Western 60, a 2-8-0 built in Schenectady in 1937, currently operates in passenger service on the Black River & Western Railroad in Ringoes, NJ.

Alco RSD-16 were used in San Martín Line of Argentina until 2014.

Some Alcos survive on Australian networks, as well as in Bangladesh and Pakistan. Another fleet of Alco Bombardier locomotives run in rugged terrain on the Sri Lanka railway network. Argentina also has a healthy fleet of Alcos DL540 running commuter and cargo trains.

The Glenbrook Vintage Railway New Zealand, has a 2-4-4-2 articulated compound mallet, built by Alco in 1912. Only four mallets with this wheel arrangement were ever built; the other three by Baldwin. This unique loco is currently out of service awaiting overhaul.

During the 1970s, Romania's UCMR Resita made licensed engines from ALCo, putting the engines 6&12R251 into naval gensets and also with the 6R251 in FAUR factory were made locomotives known as LDH 1500 CP. (CFR Classes 67/68/70/71 and CFR Class 61). They were also exported in Iran and Greece (OSE)

Preserved Alco Steam Locomotives

While regular production of steam locomotives by Alco ended in the 1950s, Alco-built steam engines have been preserved in locations across North America. They can be found on the Nevada Northern Railway in Ely, Nevada; in the Orange Empire Railway Museum in California, on the Lake Whatcom Railway in Washington and on the Durango and Silverton Narrow Gauge Railroad in Colorado. Several Alco-built mainline engines are still operational, such as Union Pacific 844, Union Pacific 3985, Milwaukee Road 261 and Soo Line 1003. What is probably the most famous Alco steam locomotive ever built, Union Pacific Big Boy 4014, has been restored by the Union Pacific Railroad for excursion service.

In Portugal an Alco 2-8-2 locomotive built 1945 (Construction number: 73480) is undergoing major restoration to be displayed at the National Railway Museum at Entroncamento.[18]

WW2 Museum - American Locomotive Company

By Sarah Jones ; Source : [HI000H][GDrive]

The American Locomotive Company (ALCO) of Schenectady, NY, founded in 1845, was an important producer of locomotives and tanks for the war. In 1939, ALCO's output was $22,358. By 1943, in the midst of the war, it had increased by over 1800 percent to $428,905,600. During the first four years of the war, ALCO produced more than it had in the first twenty-five years of the 20th century. As Lieut. Gen. Somervell, the Commanding General, Army Service Forces, said "The American Locomotive Company has been in the forefront of our armament program."

On November 23, 1940, more than a year before Pearl Harbor, the Schenectady plant received a contract to build medium tanks. They immediately began the conversion of their locomotive manufacturing buildings, dedicating thousands of square feet to the production of tanks. ALCO continued to assemble locomotives alongside the tanks. By April 19, 1941, the first of these tanks was successfully tested and approved by government officials. Having never before built a tank, ALCO was the first to produce a M3 "General Lee" tank that was satisfactory to the army. ALCO also manufactured the M4 "General Sherman" tank.

In 1942, William Lentz, the Schenectady plant manager, lobbied for a contract to build a tank killer. After obtaining the contract from the US government, ALCO began design and production of a tank destroyer, the M7, nicknamed "The Priest". The Schenectady plant designed and manufactured the first M7 in only nineteen days, using the M3 tank chassis. The M7 was equipped with a 105 mm howitzer which had a range of seven miles. It proved crucial during the battle of El Alamein in Egypt, in November of 1942. The British army surprised Rommel's forces when one thousand M7s burst suddenly on the scene and stopped the German advance through North Africa. Even though the M7 had been in production in Schenectady for months, not a word had leaked to German ears. Schenectady became known as "The city that kept a secret." Don Godard declared on radio station WEAF on January 4, 1943, "For months, thousands of employees of the American Locomotive plant up in Schenectady were engaged in the production of a secret weapon. Practically all of them knew what it was they were building - the most destructive anti-tank device the world had ever seen... It came to the Germans as a complete surprise. A complete surprise thanks to the fact that thousands of employees... were able to keep their lips buttoned up since June." The hard work done by ALCO turned the tide in North Africa. In all, ALCO produced approximately 6,000 tanks during WWII.

To thank the ALCO employees, representatives of the American and British Armies celebrated "M7 Tank Day" in Schenectady on April 10, 1943, the anniversary of ALCO's delivery of the M7 prototype. In a ceremony at Liberty Park, a time capsule, with a hammer used on the first M7 and sand from the Sahara, was buried under a stone marker. The highlight of the day was when tanks paraded down Erie Boulevard, featuring the M7.

ALCO also produced 1,086 steam and 157 diesel locomotives for the war effort. Many of these were used on the Trans-Iranian Railroad. In late 1942, Russia needed supplies because the Nazi U-boats had crippled the Murmansk sea convoy route. The US military repaired the old and inadequate Iranian Railroad and ALCO renovated 57 locomotives to run on it. The locomotives were delivered at the Persian Gulf and rode up to Tehran. The first locomotive reached Tehran in March 1943. Two ALCO locomotives that served on the railroad were the 8000 (Susquehanna) and the 8008. Both were requisitioned by the US government and were modified by ALCO to run on the Iranian tracks. By May 1943, the Russian requirement for munitions was exceeded by 18 percent. Many of the workers who operated the Trans-Iranian Railroad were trained at ALCO or were former ALCO employees now in the army.

The products produced at ALCO were vital to the victory of the Allies. The locomotives that were modified and built at ALCO supplied the Russians via the Trans-Iranian Railroad and the M7 tank killer was used to great effect in North Africa and in Europe. Many NY factories helped to arm the Allies, including those at the Brooklyn Navy Yard and the Watervliet Arsenal. Allied success in WWII was due in part to the great work and the dedication of the industries and workers of the State of New York.

SM-1 L Small Modular Nuclear Reactor

See 🌐SM-1

Research and development of the reactor design was conducted in 1952–54 at the Oak Ridge National Laboratory, under the guidance of the Package Power Group. Funding for the reactor was approved in 1954 and bids to construct the facility were received from 18 companies, ranging in price from $2 million to $7 million.[3] According to *Time* magazine of 18 July 1955, the Army selected the low bid ($2,096,753), submitted by the American Locomotive Company (ALCO Products) of Schenectady, New York, and awarded the contract in December 1954.[4]

The name "SM-1" stands for Stationary, Medium-size reactor, prototype #1. The pressurized-water reactor (PWR) design developed by the AEC was a heterogeneous, water-cooled and water-moderated, stainless steel system, using highly enriched (93%) uranium dioxide mixture as fuel.[5]

The term "package" in the name *Army Package Power Reactor* refers to the program objective of designing a compact nuclear power plant whose components could be packed for delivery to remote facilities aboard large military transport aircraft. The SM-1 served as the prototype for the SM-1A power plant, which was constructed at Fort Greely, Alaska between 1960–62. The reactor core itself was compact, about the size of a household dishwasher.[6]

At a press conference held on 19 August 1954, (then) Major General Sturgis, Chief of Engineers, announced the plan by the Army and the AEC to build the "package" power plant at Fort Belvoir. A location in a "closed area" of the garrison had been selected, near a point at which Accotink Bay (aka, Gunston Cove) joins the Potomac River. The general said the design of the package reactor resembles the nuclear power plant on the US Navy's (newly launched) nuclear submarine Nautilus. He also said the reactor could be housed in a building 29 feet wide, 42 feet high and 80 feet long. The Army was sending out a request for proposals, that day, to "33 qualified bidders", and companies were being asked to come up with a "competitive lump-sum bid", rather than a cost-plus estimate.[7]**On 14 December 1954, the AEC announced that the contract was being given to American Locomotive Company of New York, whose $2 million bid was the lowest of the 18 proposals received.**[8] Asking companies to submit a lump-sum bid was hailed, at that time, as a sign of how much progress had been made in reactor power plant design by mid-1954, such that companies now had sufficient experience and could calculate costs with confidence.

Construction of the building to house the reactor began on 5 October 1955 in the southeast "corner" of Fort Belvoir, Virginia, alongside Gunston Cove, off the Potomac River. According to a news note in the December 1955 *Bulletin of the Atomic Scientists*, "Construction of the 'package' or portable reactor has been started at Fort Belvoir, VA. Alco Products is the contractor for the Defense Department and the AEC. The reactor will generate about 2,000 kilowatts of electricity, enough for a community of about 5,000 people."[9] Alco Products supplied the reactor, pressurizer and steam generator, while Westinghouse Electric Corporation supplied the canned-rotor pumps, General Electric supplied the turbine and generator, the Lummus Company supplied the condenser, and Minneapolis-Honeywell installed the controls. By late October 1955, the Army pushed ALCO to accelerate construction towards a completion date of 10 July 1957.[10] As a result, all major work was completed by March 1957.

American Computer Group [of CA/AZ]

This page is for a company (or subsidiary?) called **American Computer Group** that was said to have been started in California in 1983 or 1984, and eventually moved to Arizona in the 1990s.

A **Rodney Lance Joffe (born 1954)** claimed multiple times to be the founder of American Group Group.

Note there is an "American Computer Group, Inc" in the Boston area. We are uncertain if there is any relaitonship between these two.

Adolf "Sonny" Monosson and American Computer Group, Inc

https://www.bfec.com/about

Started in 1968, BFEC is celebrating its 47th year in business! It all began with **Sonny Monosson**, known as a true pioneer in the venture leasing industry, who started over 14 companies. After receiving a BS in Electrical Engineering from MIT, Sonny went directly to Harvard Business School and went to work for his father in the Garment industry. After working with the factoring companies that factored their receivables, he realized he liked the business model and decided to start his own factoring company, Berkeley Finance Corporation in 1957.

In the sixties, he started the first computerized finance company, which lead to many inquiries, and he sold his portfolio and started a consulting company with two partners. After consulting and writing many studies on the computer industry, he and one of his partners started American Used Computer, one of the first used computer dealers and along the way became an authorized DEC dealer. This led Sonny to become an "expert" on DEC and so, he sold his factoring portfolio and wrote newsletters MONOSSON on DEC and columns in many of the computer oriented publications of the time.

He soon realized that since he had a vehicle to sell computer equipment, he could lease equipment to risky credits, and if they didn't succeed, he could simply take back the equipment and resell it. **At the same time, American Computer Group leased communication equipment to Fortune 100 companies, while Boston Financial & Equity leased to the early stage and venture backed companies.** Sonny passed away in 2003 but he would be proud of his well-trained group of employees who have been working together for the last twenty-five years!

(obituary) Adolf Monosson; established a market for computer leasing

http://archive.boston.com/news/globe/obituaries/articles/2003/10/07/adolf_monosson_established_a_market_for_computer_leasing/

2003-10-07-boston-com-news-adolf-monosson-obituaries.pdf

By Martha Bartle, Globe Correspondent, 10/7/2003

Adolf "Sonny" Monosson, who established a market for leased computers in the United States and was known for his signature red bow ties and forward thinking, died Friday at Beth Israel Deaconess Medical Center.

He was 76 and was managing his businesses until his death.

A Boston native, Mr. Monosson graduated from Brookline High School where he excelled in the sciences. At age 16, he enrolled at the Massachusetts Institute of Technology. His studies were interrupted when he served in the Navy for two years.

Mr. Monosson graduated from MIT in 1948 and earned an MBA from Harvard Business School in 1950. The day after classes ended, he married Gloria Haskins, the daughter of a Brookline doctor, whom he had earlier lost a chance to ask out in a coin toss with a friend. He asked her out anyway.

In his 20s, Mr. Monosson founded American Used Computers, the first such business in the country. The business leased high-tech computer equipment to high-risk businesses.

His first client was NASA, which leased a DEC computer that delivered the first pictures of Mars and Venus from space.

Mr. Monosson was always noticed for his eccentricities and intelligence, said his daughter, Susan Kooper of Somerville. At a 1970 National Computer Conference in Atlantic City, Mr. Monosson took an alternative approach to sales. When most people were inside the conference, he was strolling along the boardwalk wearing a sandwich board advertising his computers.

"I used to tell people, `I've got a great used computer for you,' and they'd say, `A used what?' " Mr. Monosson recalled in a 1984 interview with Inc. magazine.

"He was not a very ordinary man," said another daughter, Debbie of Cambridge. "He was very quirky and spoke his own mind."

But he was a serious business man who ran a finance company, which eventually grew into Boston Financial & Equity Corp. He wrote a column for Digital Review for several years and published the newsletter Monosson on DEC, becoming an authority on Digital Equipment Corp. Mr. Monosson enjoyed taking his family skiing and hiking.

Kooper recalled a time the family had gone skiing and her aunt was bewildered one morning to find the usually raucous children eating breakfast in silence. She soon realized that Mr. Monosson had fed them chocolate cake, ice cream, and ginger ale.

"He was a great father," Monosson said. "He was tough, but kind, and brought us all up to think independently."

Mr. Monosson was also devoted to his Japanese rock garden, converted from a backyard swimming pool complete with steps and a waterfall. Several years ago, he passed a few sickly cactus plants that garden store employees were planning to throw out. Mr. Monosson offered to take the plants home and nurse them back to health. The plants are now alive and well in Mr. Monosson's home, Kooper said.

In addition to his wife and two daughters, he leaves two other daughters, Judith Scherzer of Lexington and Emily of Montague; and four grandchildren.

A memorial service will be held today at 2 p.m. in Levine Chapels in Brookline. Burial will be private.

ARTICLES OF INCORPORATION

OF

AMERICAN COMPUTER GROUP

I

The name of this corporation is:

AMERICAN COMPUTER GROUP

II

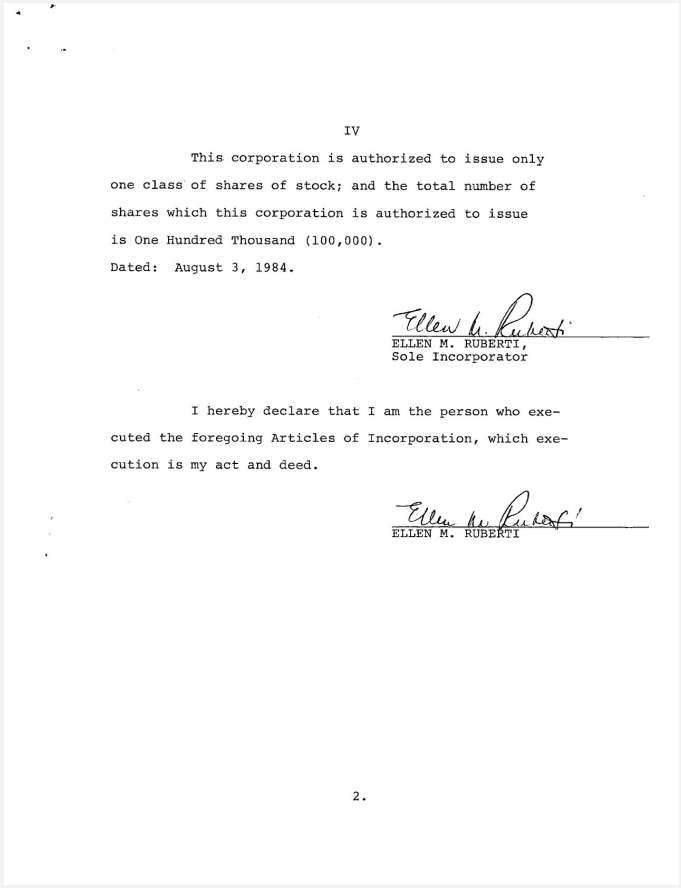
The purpose of this corporation is to engage in any lawful act or activity for which a corporation may be organized under the General Corporation Law of California other than the banking business, the trust company business or the practice of a profession permitted to be incorporated by the California Corporations Code.

III

The name and address in the State of California of this corporation's initial agent for service of process is:

Paul Schaeffer, Esq.
15910 Ventura Boulevard
Suite 1701
Encino, California 91436

[HC005P][GDrive]



IV

This corporation is authorized to issue only one class of shares of stock; and the total number of shares which this corporation is authorized to issue is One Hundred Thousand (100,000).

Dated: August 3, 1984.

Ellen M. Ruberti
ELLEN M. RUBERTI,
Sole Incorporator

I hereby declare that I am the person who executed the foregoing Articles of Incorporation, which execution is my act and deed.

Ellen M. Ruberti
ELLEN M. RUBERTI

BY Sharon Stewart NOVEMBER 30, 1998

Bell High teacher Scott Morris helps students in the school's computer lab. With help from USC's Information Services Division, Bell has become the Internet access provider for other schools. The university absorbed the annual fee for using high-speed data transmission lines operated by Los Nettos, a consortium that provides Internet access.

Mary Lewis has two characteristics of most great teachers: She is insatiably curious, and she constantly seeks new ways to inspire her students to engage in critical thinking.

Lewis, a sixth-grade math and science teacher at Foshay Learning Center, jumped at the chance several years ago to take Web Masters/Info Masters computer classes offered to teachers at USC's Family of Five Schools.

The classes "made my searching [the Internet] more efficient, more productive and a great deal faster," Lewis said. "The time thing is really important because by the time you finish correcting papers after school, it's 5 or 6 at night and you don't have time to go to the library. Now I can just get on the computer for any research I need to do."

Foshay, 32nd Street USC Performing Arts Magnet and Weemes, Norwood Street and Vermont Avenue elementary schools are members of USC's Family of Five Schools, a public-private partnership that provides special educational, cultural and developmental opportunities for 8,000 children who live close to USC's University Park campus.

Foshay's entrée to the Internet – made possible by USC's Information Services Division (ISD) and its Information Technology Services (ITS) branch and an assortment of other private and public agencies – helps level the playing field for the school's kindergarten – through 12th-grade students and their counterparts from more affluent neighborhoods, said Lisa Beebe, Foshay's technology co-coordinator.

USC's role in helping Foshay and about 16 area schools hook up to the Internet over the past five years "is definitely part of [the university's] outreach to the community," said Beebe, who also teaches 10th- through 12th-grade technology classes. "They are bringing us something that is not easy to get and something that most schools can't generally afford."

Talks on how to help schools gain access to the Internet began in 1994, said ITS project manager Marty Ruggles.

"Bell High School was the first project," Ruggles said. "They came to us trying to find a solution for getting Internet connectivity because they were frustrated with the length of time it was taking for L.A. schools to get wired and on-line. They wanted cooperation from us to establish that connectivity."

And thanks to USC's participation in a regional consortium that provides high-quality network connections at the lowest possible cost, it was able to help not only Bell High school, but other schools as well.

"We definitely cut them a deal," Ruggles said of the university's absorption of the $10,000 annual fee to use the high-speed data transmission lines operated by Los Nettos, the consortium of institutions that provides access to the Internet.

"With our mandate to be working with the community, we initially went ahead and developed a program with Bell, then Roosevelt and Manual Arts high schools, Foshay and Elizabeth Learning Centers and Don Bosco Technical Institute, a private school in Rosemead," he said. "We actually had several people in our department volunteer to work with each school in the Family of Five Schools to help them figure out how they should set up their network."

The Los Nettos consortium includes USC, Caltech, the Jet Propulsion Laboratory, USC's Information Sciences Institute, TRW, UCLA and the American Computer Group.

Bell High was a natural place for USC to start, said Mike Goldberg, who with his wife, teacher Bonnie Goldberg, and another teacher, Scott Morris, had already set up a computer lab at Bell. In order to advance to a networking system, the three approached the Defense Advanced Research Projects Agency (DARPA) and USC.

"We told those guys that if we were to get an Internet connection, we could turn around and in three weeks have 200 kids a day doing research on the Internet with good instruction behind it," Goldberg said. "DARPA gave us two routers and as much professional help as we wanted, and USC gave us the high-speed access to the Internet. This allowed us to hook our network up."

And an on-line visit to www.bell.K12.ca.us will prove that the school has lived up to its promise, Goldberg said.

"All of our feeder elementary schools feed into our access lines, while we feed into USC's," said teacher Scott Morris. "USC has allowed us carte blanche connection. They made it very painless for us to get started, letting us focus on curriculum. It's been a great relationship."

Bell – like Foshay, Manual Arts and Roosevelt – has become the Internet access provider for other schools. "BellNet" serves the Bell High Cluster of Los Angeles public schools in the cities of Bell, Cudahy, Huntington Park and Maywood.

"They are like the hub of a wheel, and these other schools are the spokes out from them," said Ruggles. "They have Integrated Service Digital Network (ISDN) circuits which link the outlying schools to the hub school."

It's a sort of trickle-down theory that really does work, said USC Director of Networking James Wiedel.

"We provide a 1 1/2 megabit-per-second circuit to the host schools, which is equivalent to sending or receiving 40 single-spaced pages per second. The feeder schools, using ISDN dial-up, connect to that line," said Wiedel, who designed and maintains USC's computer network system. "For instance, schools get to the Internet through Foshay, then back to us and then out to the rest of the world. It's a seamless approach."

Each school pays for and maintains its own equipment, but USC "is picking up the bill for the Los Nettos access," Wiedel said.

Students and teachers are benefiting from USC's commitment to its neighbors, said Foshay's Beebe. Math and science teacher Mary Lewis is a shining example. [...]

AMERICAN COMPUTER GROUP
****

Certificate of Determination of the Rights, Preferences,
Privileges, and Restrictions of the Preferred Stock,
Series A, Pursuant to Section 401 of the General Corporation
Law of the State of California
****

The undersigned, Thomas Castellanos and Kevin Finocchiaro,
hereby certify that:

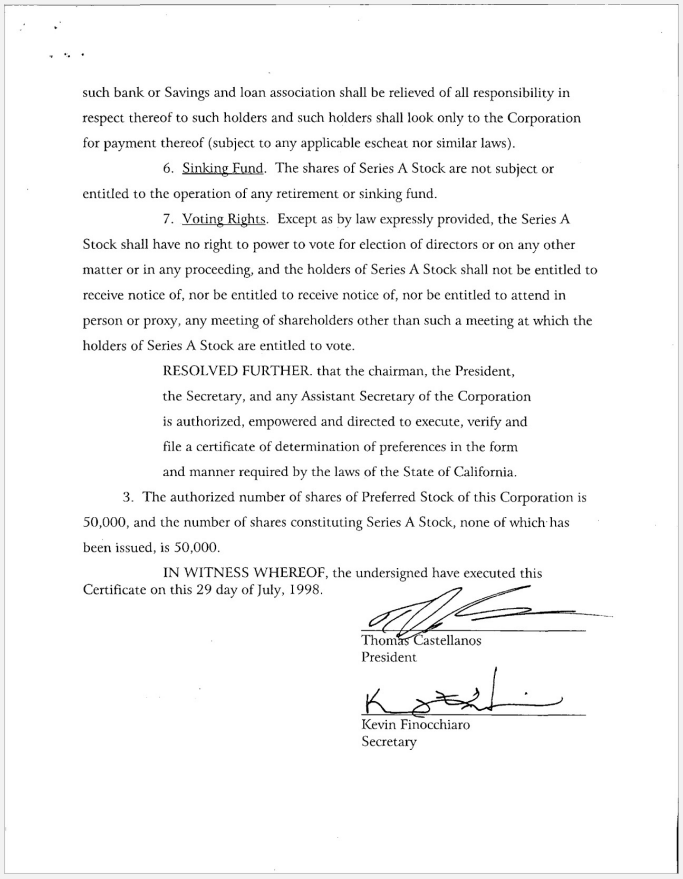
1. They are the duly elected and acting president and secretary, respectively, of American Computer Group, a corporation organized and existing under the General Corporation Law of the State of California (the "Corporation").

2. Pursuant to authority expressly vested in and conferred upon the Board of Directors of the Corporation by the provisions of the Articles of Incorporation of the Corporation, as amended, and pursuant to the provisions of Section 401 of the General Corporation Law of the State of California, the Board of Directors of the Corporation, at meeting thereof duly called and held pursuant to the Bylaws of the Corporation on July 31, 1998, at which meeting a quorum was present and acting throughout, duly adopted the following resolutions:

RESOLVED FURTHER, that the Board of Directors, pursuant to authority expressly vested in it by the provisions of the Articles of Incorporation, as amended, hereby authorizes the issuance of an initial series of Preferred Stock of the Corporation and hereby fixes and determines the rights, preferences, privileges, and restrictions thereof, and other matters relating thereto, as follows:

1. Designation and Number of Shares. The distinctive designation of the series of Preferred Stock of the Corporation hereby designated shall be "Preferred Stock, Series A" (herein after the "Series A Stock"). The number of shares of Series

Page 1 of 11
[][GDrive]



such bank or Savings and loan association shall be relieved of all responsibility in respect thereof to such holders and such holders shall look only to the Corporation for payment thereof (subject to any applicable escheat nor similar laws).

6. Sinking Fund. The shares of Series A Stock are not subject or entitled to the operation of any retirement or sinking fund.

7. Voting Rights. Except as by law expressly provided, the Series A Stock shall have no right to power to vote for election of directors or on any other matter or in any proceeding, and the holders of Series A Stock shall not be entitled to receive notice of, nor be entitled to receive notice of, nor be entitled to attend in person or proxy, any meeting of shareholders other than such a meeting at which the holders of Series A Stock are entitled to vote.

RESOLVED FURTHER. that the chairman, the President, the Secretary, and any Assistant Secretary of the Corporation is authorized, empowered and directed to execute, verify and file a certificate of determination of preferences in the form and manner required by the laws of the State of California.

3. The authorized number of shares of Preferred Stock of this Corporation is 50,000, and the number of shares constituting Series A Stock, none of which has been issued, is 50,000.

IN WITNESS WHEREOF, the undersigned have executed this Certificate on this 29 day of July, 1998.

"BRIAN LEWIS".. 1988 to 1992ish (est)

Source : Morgan Timms/The Taos News - Aug 8, 2018 - See https://www.taosnews.com/news/know-your-neighbor-brian-lewis/article_d2a0f4dc-c0a4-5065-8642-1092cd93f677.html

[...] While Volkswagens form a large portion of [Brian Lewis]' life, his past and present includes a much larger story. He was born in Los Angeles and grew up in Echo Park, a low-income, racially diverse community. The product of the Los Angeles school system, Lewis earned an overall A-/B+ overall average and performed as a top athlete. [...]

Lewis lived in Los Angeles from 1959 to 1992 in a wonderful, diverse neighborhood much like the population of Taos. This experience taught Brian not to judge people by race, color or creed. He developed a love of cultures, especially foods, and by age 7, knew all the possible cuss words in Spanish. He and his California neighbors remain friendly to this day.

After high school, Lewis traveled for six months and then worked for six months, enjoying his love of surfing around the world. Notable sites of special surfing include the following: Australia; Hawaii; Portugal; Bali; Mexico City; France; Costa Rica; New Zealand; and Puerto Rico. He graduated from Cal State LA with a bachelor's degree in physical education in 1983. Other employment reveals Lewis' varied talents and interests. H**e completed work in the mail order section of an alternative record store, Rockaway Records, until he finished his degree. In 1988, Lewis worked as a programmer and during that time, he lost all his worldly possessions in a house fire. Brian served as assistant manager of a pottery and floral warehouse. For six years, he worked for American Computer Group in Los Angeles.** During the Rodney King riots [those were April and May 1992}, he realized the thin line between sanity and insanity and decided to leave the city.

On a more personal level, Lewis met his wife Yvonne at a family wedding on Catalina Island. The couple married 23 years ago. She works at Berkshire Hathaway, and the couple live with five rescue dogs and a gift, a desert box turtle. He moved to Taos to help care for his ailing mother, Sophia Lewis, who taught for 40 years. She passed away in 2001. His father, Dr. Albert J. Lewis, a teacher, psychiatrist and social and political activist, died in 2009. Lewis credits his parents for his varied interests. He also enjoys time with his brother Aaron who lives in Carson. . [...]

Active Los Angeles, CA — Vice President for Israel Emergency Alliance, Inc.

https://www.corporationwiki.com/California/Los-Angeles/israel-emergency-alliance-inc/66582328.aspx

Israel Emergency Alliance, Inc. filed as a Foreign Non Profit Corporation in the State of Florida on Friday, October 15, 2010 and is approximately eleven years old, according to public records filed with Florida Department of State. A corporate filing is called a foreign filing when an existing corporate entity files in a state other than the state they originally filed in. This does not necessarily mean that they are from outside the United States.

Late in the summer of 1999, **Dr. Deborah Asni**s had three patients in Flushing Hospital in New York who had similar, dire symptoms and were not responding to treatment.

The patients had three things in common: all were from the same part of Queens, were 60 or older, and had dark tans. It was that last clue that eventually unlocked the mystery, leading to the diagnosis of the first known West Nile virus cases in the country.

It was the kind of situation that Asnis, chief of infectious diseases at the hospital, had trained for.

“I found infectious diseases to be fascinating,” she said in a 1999 New York Daily News interview. “It was challenging and intellectual, like a mystery that you have to solve.”

Asnis, 59, died Sept. 12 at Memorial Sloan Kettering Cancer Center in New York. The cause was breast cancer, said her son, Joshua Kazdin.

The medical mystery began when a man who lived in Queens was admitted to Flushing Hospital with a high fever and signs of delirium. Within a few days, he was so weak he couldn’t lift his arms. Before long, additional patients arrived with similar symptoms.

Asnis thought the cause might be a virus that hit the area, but antiviral drugs didn’t help. Other causes she considered included Guillain-Barre syndrome or botulism, but those didn’t quite fit the symptoms she was seeing.

She sounded the alarm, calling the city’s Bureau of Communicable Diseases, which in turn notified the Centers for Disease Control and Prevention. Asnis kept doing tests on patients, sending blood samples and spinal fluid packed in dry ice to a state lab.

More local people with similar symptoms were admitted. “It almost came to the point where if you showed up in the hospital with a 104-degree fever and a headache, you got a spinal tap,” Asnis told the Daily News.

Patients grew steadily worse, with some needing respirators to breathe, the Associated Press reported. Investigators, including Marci Layton of the city health department, came to the hospital to talk to the families, looking for clues.

The fact that they many were tanned indicated they spent a lot of time outdoors during the summer, and as it turned out, several loved to garden. Could the cause be a virus carried by mosquitoes?

“[Dr. Marcelle C. Layton (born 1958)] said that first,” Asnis said in an interview with Newsday.

An entomologist sent to the neighborhood found that stagnant ponds and even liquid in discarded beer cans had become vibrant breeding grounds for the insects in a summer with less rain than usual. The mosquito-borne disease was identified, wrongly as it turned out, as St. Louis encephalitis.

With some patients dying and word of the disease spreading, Mayor Rudolph Giuliani announced measures were being taken, including malathion insecticide spraying from helicopters. The onset of cooler weather also helped wipe out the disease-carrying mosquitoes.

In late September it was finally determined that the actual disease was West Nile virus, also carried by the insects.

Asnis’ quick actions in identifying and reporting the mysterious “cluster” of patients with serious symptoms was credited with keeping the outbreak from being worse.

She was born July 17, 1956, in New Hyde Park on Long Island and graduated from Roslyn High School. Asnis went to Northwestern University for her undergraduate and medical degrees.

The medical profession ran in the family — her father was a dentist and two older brothers became physicians. But Asnis’ inspiration was her mother, Ruth.

“She was an accountancy teacher, but we called her ‘Doctor Mom,’” Deborah Asnis told the Daily News in the 1999 interview. “She wanted me to pursue a career that I could use to be independent.”

Ruth Asnis died on Friday.

Deborah Asnis is survived by her husband, Dr. Hal Kazdin; sons Joshua and Matthew Kazdin; and brother Dr. Gregory Asnis.

Source : [HK006U][GDrive]

Deborah Susan Asnis (July 17, 1956 – September 12, 2015, aged 59) was an American infectious disease specialist and H.I.V. clinical researcher, who is credited with reporting the first human cases of West Nile virus in the United States.[1][2]

In August 1999, Asnis, the chief of infectious diseases at Flushing Hospital Medical Center in Queens, New York, noticed two male patients with similar, mysterious symptoms. Their symptoms included loss of arm and leg control, high fevers, and disorientation. She reported her patients' unusual symptoms to health authorities, who pursued further testing and analysis of the illness.[1] Asnis' patients were diagnosed with West Nile virus in September 1999, the first known human cases of the disease in the United States.[1][2]

Asnis had been praised for reporting her patients' symptoms to authorities.[1] Not only did her actions lead to the discovery of the West Nile virus in the United States, but, by alerting authorities, Asnis likely prevented a more widespread initial outbreak of West Nile in the country.[1][2]

Biography

Asnis was born on July 17, 1956, in New Hyde Park, New York, to Ruth (née Kornblum), an accounting teacher, and Myron Asnis, a dentist.[2] She graduated from Roslyn High School in Roslyn, New York.[2] Asnis then earned her bachelor's degree from Northwestern University and her medical degree from Northwestern's Feinberg School of Medicine in 1981.[1]

She resided in Hewlett, New York, with her husband, Hal Kazdin; the couple had two sons, Joshua and Matthew Kazdin.[1][2]

West Nile discovery in the United States

In August 1999, Deborah Asnis, an infectious disease specialist at Flushing Hospital Medical Center in Queens, noticed two male patients who were suffering from similar, unusual symptoms. **The two patients, aged 60 and 75 respectively, were exhibiting sudden paralysis in their arms and legs, as well as disorientation and high fevers.**[1][2] Lab testing also showed elevated numbers of white blood cells within the spinal fluid of both males.[1] None of the patients were responding to antiviral drugs.[2] Possible early hypothesizes included botulism, viral encephalitis, Guillain–Barré syndrome, or meningitis, but none of these illnesses exactly matched the symptoms.[1] Asnis decided to pursue a more concrete diagnosis by contacting authorities and other colleagues.[1]

Asnis contacted Marcelle Layton, the New York City Department of Health's chief epidemiologist, on Monday, August 23, 1999, to report her patients' symptoms.[1] Layton advised Asnis to send samples of the patients' blood and spinal fluid to the New York State Department of Health in Albany for further analysis.[1] By Friday, August 27, 1999, just four days after Asnis had contacted Layton, two additional patients had been identified in Queens.[1] The number rose to eight by Sunday, August 29, at Flushing Hospital Medical Center and other hospitals in Queens.[1] All of the early patients resided within a few miles of one another. They were also frequent gardeners in the evenings.[1]

The Centers for Disease Control and Prevention (C.D.C.) initially identified the mystery illness as St. Louis encephalitis on September 3, 1999.[1] The city of New York began widespread spraying for mosquitos later that same day.[1] However, laboratory testing continued to determine a definitive cause of the symptoms.

The U.S. federal government revised its diagnosis from St. Louis encephalitis to West Nile virus on September 27, 1999, citing research by [**Dr. Duane J. Gubler (born 1939)**], a C.D.C. expert on arboviruses, as well as several bird deaths in the Bronx, located to the north of Queens.[1]

Deborah Asnis was credited by health experts with the early identification of West Nile virus in the United States.[1] Her actions likely prevented a more widespread outbreak.[1][2]In their 2003 book, "The New Killer Diseases: How the Alarming Evolution of Germs Threatens Us All," authors Elinor Levy and Mark Fischetti praised Dr. Asnis' response to the symptoms, writing that, "Asnis did something other doctors might not have bothered to do."[1] They elaborated that, "One of the worst problems with our disease-detection system is that many doctors never report cases of strange symptoms, either because they are unsure of the disease they are facing, they're ignorant of the reporting requirement, or they simply never get around to it. Deborah Asnis was highly conscientious."[1]

Later life

Asnis continued to practice as the chief of infectious diseases at Flushing Hospital Medical Center.

She died from breast cancer at Memorial Sloan Kettering Cancer Center in Manhattan, New York City, on September 12, 2015, at the age of 59.[2] She was survived by her husband, Hal Kazdin; their sons, Joshua and Matthew Kazdin; and one of her two brothers, Gregory Asnis.[1] Her mother, Ruth Asnis, died on September 18, 2015.[2]

Alex Michael Azar II (born 1967)

Wikipedia Alex Azar

Saved wikipedia

Live - https://en.wikipedia.org/wiki/Alex_Azar saved - [HK001Y][GDrive]

Alex Michael Azar II (/ˈ æzɑːr/; born June 17, 1967) is an American attorney, former pharmaceutical lobbyist and executive, and current member of Donald Trump's cabinet who serves as the United States Secretary of Health and Human Services. Azar was nominated to his post by President Donald Trump on November 13, 2017, and confirmed by the United States Senate on January 24, 2018.

Azar served as General Counsel of the United States Department of Health and Human Services (HHS) from 2001 to 2005. On July 22, 2005, he was confirmed as the Deputy Secretary of Health and Human Services; he served in that capacity until his January 2007 resignation.

From 2012 to 2017, Azar was President of the U.S. division of Eli Lilly and Company, a major drug company, and a member of the board of directors of the Biotechnology Innovation Organization, a large pharmaceutical lobby.

Early life[edit]

Azar was born on June 17, 1967, in Johnstown, Pennsylvania, the son of Lynda (Zarisky) and Alex Michael Azar.[2][3] His father is of Maronite Lebanesedescent, while his maternal grandfather was a Jewish immigrant from the Russian Empire.[4][5] His father, also named Alex Azar, is a retired ophthalmologist who practiced ophthalmology in Salisbury, Maryland, for more than 30 years, and taught at Johns Hopkins Hospital. His grandfather emigrated from Lebanon in the early 20th century.[6]

Azar attended Parkside High School in Salisbury, Maryland, from 1981 to 1985. He received a B.A. degree *summa cum laude* in government and economics from Dartmouth College in 1988. He belonged to the Kappa Kappa Kappa fraternity. He earned a J.D. degree at the Yale Law School in 1991, where he served as a member of the executive committee of the *Yale Law Journal*.[7][8]

After law school, from 1991 to 1992, Azar served as a law clerk for controversial Judge Alex Kozinski of the United States Court of Appeals for the Ninth Circuit. Azar left after six weeks, and was replaced in Kozinski's chambers by Brett Kavanaugh.[9] Azar subsequently clerked for the remainder of the term for Judge J. Michael Luttig of the United States Court of Appeals for the Fourth Circuit. From 1992 to 1993, he served as a law clerk for Associate Justice Antonin Scalia of the United States Supreme Court.[10]

From 1994 to 1996, he served as an Associate Independent Counsel for Ken Starr in the United States Office of the Independent Counsel, where he worked on the first two years of the investigation into the Whitewater controversy.[11][12] At the time of Azar's appointment, he was working as an associate in Starr's law firm.[11]

Between 1996 and 2001, Azar worked for Wiley Rein, a Washington, D.C., law firm, where he achieved partner status.[13]

Health and Human Services[edit]

Official Deputy Secretary portrait

On August 3, 2001, Azar was confirmed as General Counsel of the United States Department of Health and Human Services.[14][15] George W. Bush's first HHS Secretary, Tommy Thompson, said Azar played an important role in responding to the 2001 anthrax attacks, ensuring there was a vaccine ready for smallpox, and dealing with outbreaks of SARS and influenza.[6] On July 22, 2005, Azar was confirmed as the Deputy Secretary of Health and Human Services.[16][17] He was twice confirmed unanimously by the United States Senate.

Working under Secretary Mike Leavitt, Deputy Azar supervised the operation of HHS, which would grow to annual budget of over $1 trillion by 2017 when he was appointed Secretary. Azar led the development and approval of HHS regulations, led U.S. government efforts to encourage worldwide pharmaceutical and medical device innovation, and was in charge of the HHS response to an initiative implemented by President George W. Bush to improve government performance.[6]

Azar resigned in January 2007.[18]

Eli Lilly & Co.[edit]

In June 2007, Azar was hired by Eli Lilly and Company chief executive officer Sidney Taurel to be the company's top lobbyist and spokesman as its Senior Vice President of Corporate Affairs and Communications.[6][19] Azar left the position after the 2008 United States presidential election was won by

Democratic Party candidate Barack Obama and the corporation wanted to replace Azar with a Democrat in that role.[citation needed]

In April 2009, Azar became Vice President of Lilly's U.S. Managed Healthcare Services organization and its Puerto Rico affiliate.[20] In 2009, the company paid $1.415 billion to settle criminal charges regarding its promotion of antipsychotic drug Zyprexa (olanzapine) for off-label uses between 1999 and 2005.[19]

Effective January 1, 2012, Azar became President of Lilly USA, LLC, the largest division of Eli Lilly and Company, and was responsible for the company's entire operations in the United States.[20]Prices for drugs rose substantially under Azar's leadership, including the tripling of the cost of the company's top-selling insulin drug. Also under Azar's watch, Eli Lilly was one of three companies accused in a class-action lawsuit of exploiting the drug pricing system to increase profits for insulin. Eli Lilly was also fined in Mexico for colluding on the price of insulin.[21][22] In connection with the position, Azar served on the board of directors of the Biotechnology Innovation Organization, a pharmaceutical lobby.[23]

In January 2017, Azar resigned from Eli Lilly "to pursue other career opportunities" as a result of a company reorganization.[24] He also resigned from the board of directors of the Biotechnology Innovation Organization. In his last year at the corporation he earned $2 million.[25]

Secretary of Health and Human Services[edit]

Nomination and tenure[edit]

Azar and his family (with President Trump and Vice President Pence) shortly after being sworn in as Secretary of Health and Human Services

On November 13, 2017, President Trump announced via Twitter that he would nominate Azar to be the next Secretary of Health and Human Services.[23][26]

Many health care advocates raised concerns about the nomination, citing Azar's track record of raising drug prices and his opposition to Obamacare; his preferences, that is, for a "free market" to meet all Americans' health care needs.[27] Critics noted that Azar approved a tripling of the price of insulin while CEO of Eli Lilly.[28][29] Speaking in favor of his nomination were two former U.S. Senate Majority Leaders, Democrat Tom Daschle and Republican Bill Frist. Both those endorsers were affiliated with the Bipartisan Policy Center, a Washington D.C. think-tank which receives support from Eli Lilly.[30]

In spite of objections, his nomination was relatively smooth. Azar was confirmed on January 24, 2018, with a vote of 55–43,[31] with most Democrats opposed. Voting against him, Oregon Senator Ron Wyden, ranking member on the Senate Finance Committee, said that while Azar was at Eli Lilly, he "never, not one time, signed off on a decrease in the price of a drug.[32] Senator Bernie Sanders said in a press release, "The nomination of Alex Azar, the former head of Eli Lilly's U.S. operations, shows that Trump was never serious about his promise to stop the pharmaceutical industry from 'getting away with murder'." "The last thing we need is to put a pharmaceutical executive in charge of the Department of Health and Human Services." During that tenure, Eli was fined for colluding to maintain high drug costs in Mexico.[28]

Azar had additionally consulted with numerous other biopharmaceutical and health insurance corporations regarding government policy, product access, sales and marketing, pricing, reimbursement and distribution.[28] He was confirmed by the Senate on January 24, 2018 and sworn in by Vice President Pence on January 29, 2018.[33]

Healthcare policy[edit]

Affordable Care Act[edit]

Azar has been a critic of the Patient Protection and Affordable Care Act (Obamacare) and predicted in 2017, "There will be a piece of legislation passes this year that is called the repeal of Obamacare. I don't know what's going to be in the substance of it, but there will be a piece of legislation that says that."[26] Also regarding the ACA, Azar said the Department of Health and Human Services has latitude to "make it work a little better".[22]

Abortion[edit]

Azar opposes abortion. In a written response to Senator Patty Murray regarding future HHS policy, he said, "The mission of HHS is to enhance the health and well-being of all Americans, and this includes the unborn."[34]

Regulations[edit]

According to *The New York Times*, Azar differed with his predecessor, Tom Price, in terms of their approach to regulations. Writing in May 2018, *The Times* said, "in a sharp break from his predecessor — and from most Trump cabinet secretaries — he seems to be relishing the chance to write new regulations, rather than just crossing out Obama-era ones."[35]

Coronavirus[edit]

Outbreak[edit]

Azar speaks to the White Housepress corps on COVID-19 in March 2020

President Trump, with Azar, signs the Coronavirus Preparedness and Response Supplemental Appropriations Act into law on 6 March 2020

Azar informed associates that he had alerted Trump on January 18, 2020, regarding the potential danger from COVID-19, but that the president thought he was being "alarmist" as Azar struggled to get Trump's attention to focus on the issue.[36] Despite Azar's warnings, four days later, Trump announced, "We have it totally under control. It's one person coming in from China."[36] On January 28, 2020, Azar stated that the Trump administration had no plan to declare a public health emergency as the COVID-19 virus spread in China. He asserted that the risk to Americans was minimal, but admitted that authorities in 30 states were monitoring potential cases and added that he would not "hesitate at all to invoke any authorities I need to, to ensure we're taking all steps to protect the American people, but I'll do it when it's appropriate." U.S. Senator Rick Scott and U.S. Representative Vern Buchanan, as well as other Republicans, demanded the declaration of a public health emergency as a means of budgeting necessary federal funding to deal with the potential pandemic. At the time, Azar said, there were just five confirmed cases in the U.S., there was no known person-to-person transmission, and every confirmed U.S. victim had traveled to Wuhan, China (the outbreak's place of origin). "This is potentially a very serious public health threat, but at this time Americans should not worry about their own safety," Azar said. At that point, the disease had killed at least 106 people in China, with more than 4,500 cases confirmed.[37]

On February 27, U.S. Representative Jimmy Gomez of California revealed that he had been contacted by a whistleblower from the Department of Health

On February 27, U.S. Representative Jimmy Gomez of California revealed that he had been contacted by a whistleblower from the Department of Health and Human Services (HHS) who had been dispatched to deal with the arrivals of travelers exposed to the coronavirus. There were allegations made that those sent from the HHS to California quarantine sites lacked both sufficient protective clothing and the training necessary to prepare them to deal with the contagion, though they were working alongside CDC personnel who had adequate protective gear.[38] The whistleblower also said that professionals raising concerns about the unsafe practices were subjected to retaliation.[38] Azar responded to the issues raised by Gomez by saying, "Urgency does not compensate for violating isolation and quarantine protocols" and adding, "I'd want to know the full facts and would take appropriate remedial measures."[38][39]Azar insisted that careful protocols were being observed by all CDC employees.[38]

On February 28, 2020, United States Senate Finance Committee ranking member Ron Wyden wrote Azar to ask why HHS Administration for Children and Families employees were involuntarily dispatched to California to meet with quarantined travelers despite lacking expertise in the field and lacking proper information, equipment and training. Wyden also asked why said employees were not cleared to ensure that they had not become carriers of the disease before they were returned to their home stations.[40]

Centers for Disease Control and Prevention[edit]

As Secretary of Health and Human Services, Azar is responsible for the Centers for Disease Control and Prevention (CDC), a key institution in charge of containing contagious diseases. On January 28, 2020, Azar requested that the Chinese government allow a CDC expert team into their country to help them learn more about the virus. Referring to the SARS epidemic 17 years earlier, Azar said, "I can say that the posture of the Chinese government levels of cooperation and interaction with us is completely different from what we experienced in 2003 and I want to commend them for such assistance". The World Health Organization had already agreed to supply international experts to visit China "as soon as possible." Seventy-three possible cases were being monitored in the U.S. Simultaneously, the CDC had ramped up coronavirus screenings of travelers coming into the U.S. at 20 airports. Azar said it might be possible to ban any travelers arriving from China, and all options had to be considered. "Diseases are not terribly good at respecting borders," he added.[41]

Congressional testimony and requests for funding[edit]

On February 25, 2020, Azar appeared before the Senate Appropriations Committee to testify on the danger of and responses to the 2019–20 coronavirus pandemic. Louisiana Republican Senator John Kennedy asked both Azar and Chad Wolf about the fatality rate in victims. Azar said that the fatality rate of seasonal influenza was about 0.1%, and that the fatality rate of COVID-19 was estimated at between 1% and 2%; however, Azar added that the latter figure was uncertain because there might be many mild coronavirus cases yet unreported.[42] Chad Wolf said that the fatality rate for COVID-19 was between 1.5% and 2%, and that the fatality rate for influenza over the last 10 years in America was similar (about 2%).[43][44] Kennedy was unhappy with the briefing, saying afterwards, "I thought a lot of the briefing was bullshit... They would answer the question but dodge, bob and weave. I understand there's a lot they don't know. I get that. But they need to answer the questions straight up. They all talk about a task force, a committee — a committee's not going to solve this problem".[45]

Trump's officials tried to allay concerns that their request for $2.5 billion was insufficient to address the epidemic. Some Republicans joined Democrats in criticizing the funds requested and found transparency lacking with regard to a coherent strategy to contain the virus. Another Republican, Senate Appropriations Committee Chairman Richard Shelby of Alabama, told Azar: "If you lowball something like this, you'll pay for it later."[46][47][48] Pennsylvania Democratic Congressman Brendan Boyle asked Azar how he could defend "draconian cuts" in the CDC budget "at the same time we are facing a unique worldwide health crisis".[48] Two years earlier, a coalition of global health organizations opposed Trump's plans to reduce the CDC's operations in 39 of 49 countries in which it had been helping to rapidly identify and suppress outbreaks of diseases. The coalition wrote to Azar, contending, "These programs are essential to our national defense".[48][49] In 2018, National Security Adviser John Bolton dismantled the task force charged with responsibility for planning and response to epidemics. The team's leader, Rear Admiral Timothy Ziemer, was the leader of the anti-malarial efforts under presidents Barack Obama and George W. Bush.[48] White House Homeland Security adviser Tom Bossert, who had advocated a comprehensive biodefense strategy against both pandemics and potential biological attacks, departed from the White House on the same day Bolton arrived.[48]

Testing[edit]

Further information: COVID-19 testing

On March 2, 2020, Azar was criticized for unpreparedness that may have accelerated the spread of the virus. Some critics focused on the lack of definitive testing of those who might be spreading the virus. China had tested over 1,000,000 people, while the CDC had tested less than 500 and its results had been undermined by problems with accuracy and potential contamination. There was substantial internal feuding with regard to formulation of policy at HHS and the CDC.[50]

Vaccine[edit]

Azar argued that the pharmaceutical industry was best poised to discover, manufacture, and market a vaccine for coronavirus. When asked about the cost of vaccines, Azar responded that the price might be high, but that an important vaccine would be created even if many Americans could not afford it.[51]

Personal life[edit]

Azar is an Eastern Orthodox Christian. He is of Lebanese, Ukrainian, English and Swiss descent and lives in Indianapolis with his wife and two children.[33][52] Azar served for two years on the board of HMS Holdings.[53] He is currently on the board of the American Council on Germany, where he is Chairman of the Strategic Planning Committee, and the Indianapolis Symphony Orchestra.[13]

He has previously served on the board of directors of the Healthcare Leadership Council, where he was Treasurer; the National Association of Manufacturers; and the Indianapolis International Airport Authority, where he was Chairman of the Human Resources Committee.[13]

Azar is a Republican and has contributed to the campaigns of Mike Pence, Mitch McConnell, Orrin Hatch, Lamar Alexander, Jeb Bush, and Donald Trump according to the Center for Responsive Politics.[6]

FOR IMMEDIATE RELEASE

September 14, 2019

Secretary Azar Meets with Local Leaders and Visits Ebola Treatment Center

"The U.S.A. is here for you not just for Ebola, but also healthcare after Ebola."—HHS Secretary Alex Azar

BUTEMBO, DRC—Today, September 14, Health and Human Services Secretary Alex Azar, Dr. Robert Redfield, Director of the Centers for Disease Control and Prevention (CDC); Dr. Anthony S. Fauci, Director of the National Institute of Allergy and Infectious Diseases (NIAID); Garrett Grigsby, Director of the HHS Office of Global Affairs; Tim Ziemer, Senior Deputy Assistant Administrator of the United States Agency for International Development (USAID); Mike Hammer, U.S. Ambassador to the Democratic Republic of the Congo (DRC); and staff of President Trump's National Security Council joined World Health Organization (WHO) Director General Tedros Adhanom Gebreyeus and United Nations (UN) Emergency Ebola Response Coordinator (EERC) David Gressly in Butembo, DRC, where they toured an Ebola treatment center near the center of the outbreak.

During the visit, the delegation observed the detection, infection prevention, and control measures. They spoke to the healthcare providers about how they provide care for patients at the Ebola treatment center and saw patients being successfully discharged from the center. The delegation also heard from officials and healthcare workers about the challenges they face in providing care due to mistrust and the conflict in the region. Secretary Azar shared his sincere gratitude for the hard work and dedication all personnel have shown in the face of this health crisis.

Secretary Azar and the delegation also participated in a discussion with local community leaders and health personnel. The delegation heard firsthand from the women's association leader, the Federation of Commerce, the leader of the cultural associations, the representative of traditional leaders, and an Ebola survivor. They shared their perspectives on how to engage the communities more effectively in the response to combat misinformation and improve outcomes.

Secretary Azar expressed the U.S. government's strong commitment to ending the Ebola outbreak and commitment to work with local, community leaders along the way. "The U.S.A. is here for you not just for Ebola, but also healthcare after Ebola," he told the community meeting. The U.S. recognizes that health challenges in the DRC extend past Ebola and also supports efforts to fight measles, malaria, HIV, tuberculosis, cholera, and other diseases.

Health and Human Services Secretary Alex Azar visited NIH for the HHS Global-Domestic HIV Meeting: Successes and Challenges Reaching the 95-95-95 Goals. Held June 26 in Bldg. 45's Kirschstein Auditorium, the day-long meeting gathered department leaders to share ideas about common challenges in the HIV response; exchange lessons learned in HIV policy, program, implementation and research across the global and domestic experiences; and create recommendations for further collaboration across HHS. NIH director Dr. Francis Collins opened the meeting with welcoming remarks. Azar discussed the President's initiative, Ending the HIV Epidemic: A Plan for America.

Later, a panel featuring representatives from HHS agencies offered an opportunity for each to highlight contributions and areas of expertise in ending the HIV epidemic, both domestically and globally.

Press Briefing on the National Biodefense Strategy

Issued on: September 18, 2018

James S. Brady Press Briefing Room

11:30 A.M. EDT

MR. MARQUIS: I'm Garrett Marquis at the NSC. We're here for a briefing that's off camera, but on record, on the National Biodefense Strategy.

We have Ambassador John Bolton, National Security Advisor, and Health and Human Services Secretary Azar, as well. How this will flow is the Ambassador will make a few remarks, followed by Secretary Azar, and then brief Q&A, which I'll manage.

We have about 25 minutes, maybe a little bit less. And the focus of this, of course, is on the National Biodefense Strategy, so please make sure your questions are relative to that.

With that, Ambassador Bolton.

Q (Inaudible) embargo?

MR. MARQUIS: It's embargoed until we inform you (inaudible). Embargoed until 12 o'clock.

AMBASSADOR BOLTON: Well, thanks, Garrett. Thanks to all of you for being here. Last week, we commemorated the 17th anniversary of the 9/11 attacks. Today is actually the 17th anniversary of the anthrax letters, which were distributed and were thought to be an indication of possible further terrorist activity, really, I think, bringing to the attention to the American people, many of them for the very first time, the threat of bioweapons in the hands of terrorists or adversary nations.

What we're going to do today is release the National Biodefense Strategy, which we've worked out through the National Security Council process. And the President will also sign a National Security Presidential Memorandum, which will repeal prior authorities and put a new process in place.

This is, we think, critical for our defense purposes, looking at the range of weapons of mass destruction that the United States and our friends and allies face. We all focus on nuclear weapons, but biological weapons and chemical weapons are very, very dangerous. Bio and chem are often referred to as the poor

man's nuclear weapon, so they're particularly attractive to terrorist groups that want to try and cause great damage to us here at home.

So what we've done is establish a Cabinet-level biodefense steering committee that will be chaired by the Department of Health and Human Services. This is the approach that we think is going to be best suited for carrying out the strategy operationally. And Secretary Azar, who will speak to you in a second, will be chairing that.

The division of labor here is that the role of the NSC is the coordination of the development and implementation of the policy, but operationally carrying out the policy will be through this committee that HHS will chair. NSC, in this area or any other area, is not operational, going back to the lessons of the Tower Commission report after the Iran-Contra affair.

But the operational effort is something we expect to be on an ongoing basis for HHS to be the lead on. Other Cabinet departments that are involved: obviously the Defense Department; the Agricultural Department, because a biological weapons attack could be directed against our food supply, against plant and animal life. Homeland Security has a role, EPA and others.

Now, this is a biodefense strategy. It's not what our offensive counter-response would be if we were attacked. That's something we do through the regular national security channels. But it's really what we would do here in the United States and with our friends and allies.

And our intention, having now written this strategy which the President will sign, is to review it on an annual basis to move away from the concept we see in too many strategy documents, that they're written and then that's the end of the process. We want it to be continuing. HHS plays the lead role, as I say, in implementing, operationalizing this. And so we're going to work very closely together on this critical need to protect the American people from the threat of biological warfare.

So now let me turn it over to the Secretary of HHS, Alex Azar.

SECRETARY AZAR: Well, good morning, everybody. And thanks for joining us here today. I wanted to complement what Ambassador Bolton just had to say by laying out a couple of points.

I wanted to give you the historical context for the strategy and why HHS is taking the lead on biodefense, and how it also reflects the lessons that we've learned about the serious threats that we face.

So, first of all, why a biodefense strategy? The simple answer is that biological threats of a manmade, accidental, or naturally occurring nature are very real and they're growing. There are several factors that drive their growth:

As the world grows more urbanized and interconnected, infectious threats can spread more rapidly and easily than ever. Think about one of the threats that HHS is monitoring at this very second, which is the Ebola outbreak in the Eastern Democratic Republic of the Congo. Such is the ease of mobility between countries now, that just in the DRC, more than 100,000 people are being screened at border crossings every day.

We also face accidental and manmade threats. Today's rapid technological advances have great potential to improve public health and human health, but they also create the opportunity for new kinds of threats and for more and more actors to make use of biological weapons. These trends are not new, so the release of this national strategy is an important culmination of a long series of steps taken by HHS and the entire U.S. government over decades to build our biodefense capabilities.

As you'll notice — and once you see the materials — at each stage, the growing complexity of these threats demanded the involvement of more and more of the top-flight biomedical and public health expertise that we have at HHS. Back in the '90s, the Secretary, Donna Shalala, declared HHS a national security agency, detailing a Public Health Service Commissioned Corps officer to the National Security Council for the very first time.

The recognition of the importance of HHS's public health expertise to national defense grew during my first tenure in the department back in the 2000s. In the days following September 11, 17 years ago to the day, HHS was tasked with evaluating our preparedness for biological threats. And that became a very tangible responsibility with the anthrax attack 17 years ago today.

I was personally involved in much of managing the response, and we saw the importance of coordinating across government agencies. It was the FBI that had the actual spore sample, since it was criminal evidence, but we needed CDC's scientific expertise to discover that we were actually dealing with a new form of anthrax with spores so small that they were seeping through envelopes that had not even been open by the recipients.

Throughout my time at HHS, we've faced a number of other biological threats: SARS, monkeypox, pandemic flu, MERS, and more. In response, we've had to significantly expand the Department's preparedness and response capabilities, including the creation of the Office of the Assistant Secretary for Preparedness and Response.

We transformed what had been a national stockpile of pharmaceuticals into a strategic national stockpile that contains countermeasures for a wide variety of threats. We oversaw the creation of the National Disaster Medical System, which has thousands of civilian health professionals on call to prepare for and respond to healthcare and public health needs caused by disaster. In fact, right now, hundreds of NDMS members are working to respond to Florence, but they're equally important in the event of a pandemic or a biological attack.

We also created BARDA, the Biomedical Advanced Research and Development Authority, which supports the private sector to develop medical countermeasures, like vaccines, diagnostic tools, and antibiotics that will help us respond to biological, chemical, nuclear, and radiological threats.

BARDA in particular was a response to a need identified about lack of coordination. There was no single entity in the government, before BARDA, or anywhere else that was interested in bringing countermeasures from basic scientific research, all the way through development, to stockpiling and deploying those assets until we created BARDA.

So that speaks to one particular need for the biodefense strategy, and one of its key elements — that's the need they coordinate across different government agencies and the private sector.

The threats that HHS dealt with under President Obama provided another lesson about the need for a coherent and coordinated strategy. The 2014 Ebola crisis demanded efforts from all across the government. HHS took the lead on treatment and epidemiological work in West Africa and here in the U.S. But there were significant roles played by the State Department and USAID, as well as for Department of Homeland Security components, like Customs and Border Patrol. It was widely recognized that, early on, the response was not nearly as well coordinated as it should have been.

So those are a couple of other lessons incorporated into this biodefense strategy. For the first time, invest accountability in one place — the Secretary of HHS — as chairman of a coordinating committee. And it covers naturally occurring threats for the first time ever.

HHS — as chairman of a coordinating committee. And it covers naturally occurring threats for the first time ever.

This is a cooperative effort with expertise from many domains, but it's a cardinal rule of leadership that you have to have accountability, which means one leader, and that's a leadership lesson well understood by the President.

Many of the HHS activities I've just discussed will fall under this new biodefense strategy. By incorporating them into this broader framework with other agencies, we're going to have a much easier time identifying where we have gaps in our capabilities and preparedness, and addressing them in the most efficient way possible.

Most fundamentally, this strategy represents the importance to the President and to the country of biodefense as a fundamental and distinct aspect of our national security. Before 9/11, a future President understood this and recommended that we do a much better job of preparing for the possibility of a biological attack. "Our adversaries understand that if they are able to blindside us," he wrote, "they will be much more likely to succeed in blackmailing us." That future President was Donald Trump and the year was 2000.

With this strategy and President Trump's commitment to defending the health and wellbeing of the American people, it's going to be much harder for any threat — for our adversaries to be able to blindside us.

So thank you very much. And happy now with Ambassador Bolton to take questions.

MR. MARQUIS: Thank you. And just to be clear, the embargo is actually 1:00 p.m. And at that time, you'll also see a statement from the President and a factsheet come out from the White House Press.

Steve.

Q Ambassador Bolton, how vulnerable is the United States to a bio-attack? And who do you — are you suspicious of wanting to attack us?

AMBASSADOR BOLTON: Well, Secretary Azar may want to address this as well. But we're constantly monitoring a range of countries and terrorist groups for the possibility that they would acquire a biological weapons capability that could threaten us.

And the attack can come in a lot of different ways, either directly in the homeland;. It could come from people traveling into the United States previously infected. It could come from stockpiles that are smuggled into the United States or may already be here. This is something we speak with our allies about all the time.

There are any number of countries that are not the parties to the Biological Weapons Convention. There are parties that are — states that are parties to the Biological Weapons Convention that we think are violating it. I don't want to get into the intelligence at this point, but we take very seriously, as we do across the range of weapons of mass destruction, the dangers to the United States from this kind of attack, which is why we felt that bringing all of this together in a coordinated government-wide biodefense strategy to create an accountable, operational capability was so important.

SECRETARY AZAR: Yeah. I would just add the importance of non-state actors and even individuals. Remember, the anthrax attacks were conducted by an individual. So you have terrorist groups, non-state actors. Unfortunately, with the democratization of biotechnology expertise, it's a dangerous world out there, and many would either seek to do intentional harm or could even inflict accidental harm through lack of appropriate bio-security in labs.

MR. MARQUIS: Francesca.

Q Thank you. I wanted to take advantage of your time a little bit here, Ambassador Bolton, since you are here, and I wanted to ask you about Kim Jong Un's comments today about the United States. He said that, thanks to President Trump, the political situation in the region has been stabilized because he is with Moon Jae-in in South Korea today.

But at the same time, an editorial today in North Korea said that due to United States' nonsensical, irrational stubbornness, there are issues that can't be discussed right now, specifically referring to denuclearization. So I wanted to ask you for your response to that. And if you could tell us a little bit more about whether or not there will be another summit between President Trump and Mr. Kim anytime soon.

AMBASSADOR BOLTON: Yeah, I'd love to discuss the subject, but we are here today, really, just to discuss the biodefense strategy. So another time.

Q So you have no comment? You have absolutely no comment on that?

MR. MARQUIS: Is this a biodefense question?

AMBASSADOR BOLTON: We're confining this to the subject matter of the briefing.

MR. MARQUIS: Please.

Q Ambassador Bolton and Secretary Azar, can you talk a little bit about any potential cost to what you're talking about? Is there a price tag? Are you asking for any more money from Congress? And is there any new legislation that you feel needs to follow these actions, or is this simply a reorganization within the government?

And one more question. Just to follow up — when you talk about the potential of people that would be carrying out these types of attacks, you have to think about ISIS. How concerned are you that ISIS has its sights on this type of attack?

SECRETARY AZAR: So, first, great question in terms of resources and statutory authority. And that's actually one of the most important parts of this strategy. By having this coordinating committee that I, as Secretary of HHS, will chair, we're going to be conducting immediately a review across all of the relevant agencies — so that's Defense, State, Homeland Security, the Attorney General, EPA, Homeland Security, Agriculture — to basically get a survey of all of the activities going on in biodefense. And again, that's natural, manmade, accidental threats.

So what are all of the activities going — a full, sort of, collection of what resources do we have deployed against it, and then where do we see gaps. So it is really the first-ever holistic look across the government to see where are we acting, and where might there be any gaps in light of our awareness of threats, our preparedness needs, and our ability to respond.

That will then inform the 2020 budget cycle. Obviously we're later in the budget cycle. I think the biggest impact would be, as we look at the 2021 budget cycle, for a holistic look there for any gaps in funding, if we see any needs there.

I don't want to — as Ambassador Bolton said with regard to ISIS, I don't want to get into any particular actors. Obviously, we follow — we're tightly connected in to ensure that awareness — that first element of the strategy — is critical to know who's operating and also what they might be operating on.

in to ensure that awareness — that first element of the strategy — is critical to know who's operating and also what they might be operating on.

MR. MARQUIS: Great. Is this a biodefense question?

Q Yes. Two biodefense questions. First, can you discuss why HHS was the proper home for biodefense rather than the Department of Homeland Security, which has a more traditional homeland security in the title? And then, secondly, you mentioned the threats. The State Department had previously stated publicly that China, Iran, North Korea, Russia, and Syria had not been complying with the Biological Weapons Convention. Is that still the assessment of the government? And then, why has the biological issue not been the subject of the President's negotiations with Kim's —

AMBASSADOR BOLTON: Well, on the second point, I can tell you we have said we want the elimination of all North Korea's weapons of mass destruction programs, whatever they might be.

And to go to your first question — and Alex will probably want to expand on it — what we try and do when we create, across the board, national security strategies is pick the organizational structure that we think is most likely to achieve the objectives.

So in this case, we felt the evidence was overwhelming that we wanted a lead agency that would have the principal responsibility but would also be coordinating operational aspects with other departments and agencies that were involved. And the Department of Homeland Security is involved here.

But the overwhelming bulk of the scientific and technical expertise in the government on the range of biological threats we face — including, as the Secretary said, epidemiological threats, not just biological weapons attack — is in HHS. So every consideration that we could think of pointed to putting the lead responsibility in HHS, and that's what we did.

Q You mentioned that the anthrax attacks of 17 years ago was indeed a domestic one done at a National Research Laboratory here by a scientist there.

It would seem to me that that is the single greatest potential threat. And also, coupled with that, is the fact that we have so many scientists from malign states who do university work in this country. What kind of scrutiny are those scientists given by the government?

SECRETARY AZAR: So, as you may know, there are different tiers of biological research facilities all the way up to what's called biosecurity level 4, the most contained for the most dangerous select agents that we operate on. And that lab safety and control is something that at the Centers for Disease Control and Prevention out of Atlanta, that's part of my department, we regulate and focus on lab security there.

So that's actually a key part of the strategy. It's good that you mentioned that — is the lab security here in the United States. There are a fair number of labs. We need to keep that. All of the great research that we do to advance biomedicine, and also even to prepare for countermeasures, has its opposite side, which is the threat potential. Exactly what you mentioned.

So that involves having to do background checks on individuals who may be touching select agents. There's a whole regulatory regime — it's called the Select Agent Regulation that CDC has — that controls the use transport of these more dangerous components that could be used in biological weapons.

Q Okay, and a quick follow-up. It would seem to me that the real canary in the coalmine here would be local hospitals and local public health officials. Are they enlisted in your plan?

SECRETARY AZAR: Oh, sure. That's why state and local public health agencies, as well as the private sector, are critical to a coherent and comprehensive biodefense strategy. It's not just the federal government.

The CDC really operates so much through our state and local partners, and that's why we support public health epidemiological reporting, whether it's in the opioid crisis or otherwise. Absolutely.

Q Secretary Azar, you mentioned for the first time that this also focuses on naturally occurring outbreaks, for example. So how much of this strategy is focusing on preparation to prevent the next big Ebola outbreak or any other global epidemics, for example, when, in fact, we know that CDC has been criticized for cutting back field works on Ebola countries? For example, I believe it's down from 49 to 10 countries. So how prepared is the U.S. to deal with these kinds of naturally occurring epidemics when how big of this is part of this strategy?

SECRETARY AZAR: So, naturally occurring is very much a part of it, just like accidental, as well as manmade. And we're heavily engaged internationally. The best way to stop a disease outbreak in the United States is by stopping it before it ever comes to our border by being engaged abroad.

So I would differ on that assessment around our Ebola engagement through the Global Health Security Agenda. The purpose of the Global Health Security Agenda has been to actually — it's an international collaborative effort of which the United States is a very important and dedicated partner in that, under President Trump, to help other countries bring up their public health capabilities and infrastructure to comply with the modern international health regulations.

We are seeing the fruits of that today in the Democratic Republic of Congo. That is why the DRC itself diagnosed Ebola in both the earlier spring outbreak and the current one. They didn't need the World Health Organization or the CDC to do that. They did that themselves. They have been leading the response. Of course, the World Health Organization and CDC are providing critical resources, as well as others, in the international community. But it was really the great work of the Global Health Security Agenda that's making that possible.

And now you've moved to other countries. So as you build up infrastructure, public health surveillance, and operation center capabilities, you reprioritize and move — that's the nature of it — as opposed to a permanent, enduring. Staying there, you work on building the rest of them up.

Q And just to follow up on the Global Health Security Agenda, is the U.S. prepared to extend that partnership when it expires in 2019, I believe? And —

SECRETARY AZAR: Oh, so we've already set our commitment as members of the Global Health Security Agenda. So, yes, we're fully —

Q And what kind of funding —

SECRETARY AZAR: We'll work with Congress on the appropriate levels of funding. We're still working from the Ebola supplemental funding that provides the basis of the U.S. Global Health Security Agenda commitment. But we'll be working with Congress on that. But we're fully committed on the GHSA.

MR. MARQUIS: We have time for one more question. Vivian.

Q I have a question for both of you gentlemen. Ambassador Bolton, why now? I mean, is there something we need to know in terms of a credible threat to the United States? Something that prompted the administration to prioritize this currently?

And for Secretary Azar, you talked a lot about anthrax, 17 years ago. Is there any other new chemical agents? Technologies have obviously changed. Chemical — people are discovering things all the time. So is there something new that you have your eye on or you're concerned about that we don't know about in the public?

MR. BOLTON: Well, in terms of timing, this was actually mandated by statute sometime before. It was felt, I think, by my predecessors that it was important to do. Sometimes things take longer than one would like them to do. But when I came in, it was one of the things that I put a priority on to get interagency agreement. Secretary Azar has been a leader in this effort from the get-go.

And so that's what's brought it together now. No particular immediate threat, as you'll see when you read the strategy, which is quite comprehensive. It reflects a lot of work that's gone into it. And as I said, it's intended to be a living document that we can revise and update in light of the circumstances.

SECRETARY AZAR: So the threats that we face — what makes biologic defense so interesting and perplexing is that the threats we face have often been around for millennia. And they just — modern techniques of control can be applied to them, as well as modification. So gene editing tactics, other — that, as I mentioned, the innovations in biomedical research that are so wonderful, that can bring so many therapies to us, are also tactics and techniques that can be used with ill will. But it can also be rather simple to use biologic agents. That's the challenge of this and why we have to be so on our guard.

And the threat, as it was mentioned earlier, isn't just from the manmade. We are, today, the 100th anniversary of the Great Flu Pandemic of 1918. It is important to remember that 25 percent of Americans were infected with the flu — the 1918 flu; 647,000 Americans in 1918 died from that flu.

I mean, if you're extrapolating that to today, the numbers are actually — are catastrophic beyond anything we probably could imagine, even in terms of manmade in its dimension. That is also a part of this strategy of accidental, manmade, and naturally occurring disasters.

Q But that's exacerbated by World War I, right? Towards the end of World War I, though. That's how it made its way around the world, that pandemic.

MR. MARQUIS: I think that's it, guys. Thank you so much.

Q But, I mean, isn't that true?

MR. MARQUIS: Again, this is embargoed until 1 o'clock. You should expect an email from the White House with a factsheet, as well as the Biodefense Strategy.

Thank you so much everybody.

END

CHARLES J. BAKER.

Charles Joseph Baker, President of the **Canton Company** and head of the house of **Baker Brothers & Company**, was born in this city on the 28th of May, 1821. His parents, William and Jane Baker, then resided at "Friendsbury," their country seat, situated in what is now the growing and rapidly improving northwestern section of the city, within the corporate limits, although fifty years ago, it was considered sufficiently remote from the built-up portions of the town, to be denominated country. The paternal grandfather of Mr. Baker, who was the head of the dry goods importing house of Willam Baker & Sons, once well known in this city, came to Baltimore to make his own way in the world at the early age of twelve years, having been left an orphan by the massacre of his parents and all the other members of the family, by the Indians, about the year 1750. The scene of the massacre was near the foot of the Blue Ridge Mountains, not far from the present town of Reading, in Pennsylvania. The grandfather of Charles J. Baker, on the mother's side, was Richard Jones, who emigrated to this country from Caernarvonshire, in Wales, in 1781, preceding his family, in order to provide a home for them, before sending for wife and children to join him. He settled in Baltimore, in the part of the city which has retained the name of Fell's Point, and began business as a manufacturer and dealer in paints and oils, a branch of commerce which three generations of his descendants have since continued. In 1793, Mr. Jones purchased and improved the beau tiful site to which he gave the name of "Friendsbury," where the parents of Mr. C. J. Baker resided until their death, a few years since, and where the subject of this sketch was born. Like large numbers of his countrymen, Mr. Jones in early life, before his emigration to America, became a member of the Wesleyan Methodist Society, under the preaching and influence of its celebrated founder, whose personal acquaintance he enjoyed.

Charles J. Baker received his early education at home, and at boarding school, at the Franklin Academy in Reisterstown, Baltimore county, then under the charge of Mr. N. C. Brooks. After wards, he was sent for a short time to St. Mary's College, in this city, and, in 1835, entered the grammar school of Dickinson College, Carlisle, Pa. In 1837, he was admitted Freshman in the College proper, and graduated with the Class of 1841, under the presidency of the Rev. J. P. Durbin, 1). D. During his stay at Carlisle, in 1836, Mr. Baker united himself in membership with the Methodist Episcopal Church, in that place. Upon the completion of his college course, he entered the counting-room of his father, who was then engaged in the manufacture of window-glass at the old Baltimore glass works, at the foot of Federal Hill. In 1842, he started in business with his brother, H. J. Baker, on their own account, in the paint, oil, and glass trade, at No. 2 N. Liberty street. Shortly after the firm became proprietors of the Baltimore Window Glass and Bottle and Vial Glass Works, previously carried on by Shaum & Reitz. In 1843, the brothers removed to No. 42 South Charles street, and enlarged their business, until, in 1848, they were enabled to purchase the two warehouses, Nos. 32 and 34 South Charles street, and changed the stylo of the firm to that of Baker & Brother. In July, 1850, their two warehouses, with all their contents, including $75,000 worth of glass, paints, &c., were destroyed by fire. Nothing daunted by this disaster, the firm immediately commenced the work of rebuilding, and, in the course of the following year, had finished the present five story warehouses, Nos. 32 and 34, on the same site. During 1850, the two brothers, Charles J. and Henry J. Baker, organized the firm of H. J. Baker & Brother in New York city, for the purpose of conducting the same business there, and also importing French glass and chemicals. In 1851, the firm in Baltimore was changed to Baker Brothers & Company, upon the admission of a new partner, Mr. J. Rogers, Jr., and so continued until 1865, when Charles J. Baker purchased the entire interest of H. J. Baker and Mr. Rogers, and admitted his two sons, William Baker, Jr., and Charles E. Baker, into copartnership, retaining the old style of Baker Brothers & Company.

As one of the results of a successful business career, as well as of the enterprising and liberal spirit which has contributed so largely to that success, Mr. Baker has become prominently and usefully identified with various mercantile and manufacturing interests in this city. In 1859, he was elected a director in the Franklin Bank, and in 1867, was chosen its president. In 1860, he was elected a director in the Canton Company, and in 1870, was elected president, He is also interested in the Maryland White Lead Company, the Maryland Manufacturing and Fertilizing Company, and other kindred enterprises of associated capital and skill.

Through the energetic efforts of Mr. Baker, as president of the Canton Company, the Union Railroad, running from the north western limits of the city to tidewater, is being rapidly pushed for ward, and will be of immense service to the business of Baltimore.

Nor have Mr. Baker's life and energies been so far absorbed in business pursuits and undertakings, as to make him neglectful of other and higher duties. His life as a citizen has not been uneventful. In 1859-60, he took an active part in the Municipal Reform movement of that year, and was a candidate for the second branch of the City Council on the same ticket with George William Brown, for Mayor, and was elected by a large majority. In the organization of the branch, although the youngest member, Mr. Baker was elected president ; which position he continued to till during the stormy and memorable days of April, 1861, and the period which followed,—acting as Mayor of the city, *ex officio*, from September, 1861, to January, 1862, while Mayor Brown was a prisoner in Forts Lafayette and Warren.

The interest in religious matters which led Mr. Baker to identify himself early in life with the Methodist Episcopal Church has never failed or ceased. In 1855, he was associated as trustee of Baltimore City Station with the late R. G. Armstrong, David Thomas, John G. Chappell, Dr. Roberts, and others, and was connected and prominently identified with various religious movements and enterprises, such as the extension and rebuilding of the Eutaw Street M. E. Church, the erection of the Madison Avenue M. E. Church, and in the cause of missions, particularly the German Mission, under Dr. Jacoby, in Bremen, Frankfort, and elsewhere in Germany. As one of the trustees of Dickinson College, he manifested his interest and kept alive his connection with the Alma Mater of his youth. The dissensions, however, which disturbed the peace of the Metho dist Episcopal Church after 1860, led to Mr. Baker's withdrawal from the position which he held in that body. He assisted in organizing the Chatsworth Independent Methodist Church, and in build ing the present church edifice at the corner of Franklin and Pine streets, and, subsecpiently, in 1867, he aided in building the Bethany Independent Methodist Chapel at Franklin Square.

The leading traits of Mr. Baker's character may be readily in ferred from the foregoing incidents in his career. Energy and probity in business ; a high sense of duty in all the relations of life, public and private; a spirit and temper firm in the recognition and advocacy of principle, yet withal kindly and conciliatory, and always governed by the rules of Christian charity, and a liberal heart and hand in the support of all undertakings, secular or religious, which commend themselves to his sympathy and judgment, have made Mr. Baker widely respected, trusted and esteemed in this community.

Mr. Baker married, in 1842, Miss Elizabeth Bosserman, of Car lisle, Pa., daughter of Ephraim Bosserman, a merchant of that place.

"HIGHLAND COTTAGE."

RESIDENCE OF ANDREW DICKEY, SING SING, N. Y.

Henry J. Baker, the builder and first occupant of Highland Cottage, bought the property in 1869. A successful New York City businessman who moved to Ossining,[5] he had an interest in construction, having initiated the effort to build a new Methodist church in town. The local newspaper reported in March 1872 that he was going to build houses of "Swiss architecture" on his lots on Highland and Mott Street (as Maple Place was then known).[2]

Concrete had been used to build American houses before, but only rarely, due to the abundance of wood and masonry. Since it was so unusual, English workers were brought over to build the house, which early on earned the disparaging local nickname of "Mud House".[5] The concrete used for the precast blocks was Rosendale cement, made at what is now the Register-listed Snyder Estate Natural Cement Historic District in Rosendale, further north in the Hudson Valley.[5] It would be the first concrete house in Westchester County, predating the better-known reinforced concrete Ward Castle in what is now Rye Brook by four years.[2] The High Victorian Gothic style used was also an unusual choice for house.

Six years later, in 1878, Baker died. His estate took three years to sell. In 1881, the Dickey family gave it the name Highland Cottage when they moved in. Six years later, they moved. Their buyer, an elderly woman, lived there for a short time before selling in turn to a man named John Cockcroft.[2]

Contributions to Ossining (formeerly Sing Sing), NY

Preparation of a Historic Structure Report for the Westchester Preservation League of the picturesque Squire House (Highland Cottage) in Ossining (formerly Sing Sing), NY. Squire House was designed by S. Marvin McCord, Architect in a highly eclectic asymmetrical design with historical allusion to medieval precedents. Built for Henry J. Baker 1872, it was the first poured-in-place concrete house in Westchester County.

Sixteenth annual report (page 31) -

"We send out our Report for 1878 with mingled emotions of joy and sorrow. [...] Henry J. Baker, who departed this life February I7, 1878, was one of our most liberal givers, and in the days of his physical health, prompt and faithful in all the duties devolving upon him as a manager. His last years were full of weakness and pain, but the end was peaceful and triumph ant. He did not forget the Society to which he had given the best years of his Christian activity, and with the interior working of which he had been familiar for twenty years, in the distribution of his wealth."

1894 - Obituary - Brother Charles J Baker

Full page : [HN00QG][GDrive] / Article : [HN00QH][GDrive]

"Mr. Charles J. Baker, head of the firm of Baker Bros. & Co., died yesterday at "Athol," his country home on the Frederick turnpike."

Mr. Baker was widely known as one of the oldest and most successful business men of Baltimore. Besides being the head of the firm of **Baker Bros. & Co.**, in which house he commenced his business career more than City years ago, he was also interested in many other enterprises In and around Baltimore. Among these were the **Baltimore Car Wheel Company**, **St. Clair-Scott Manufacturing Company**, Equitable National Bank and the Canton Company.

While president of the **Canton Company**, in 1870, Mr. Baker was largely instrumental in securing the construction of the **Union Railroad and tunnel**, now owned by the **Pennsylvania Railroad**, and which gives the Northern Central and Western Maryland Roads tide water terminals at Canton.

For more than twenty years Mr. Baker was president of the old **Franklin Bank**, on South street, which a few years ago was merged into the **Equitable National Bank**. The Franklin was a State bank and under Mr. Baker's direction was for some years successfully conducted. He retired from active banking business when the old Franklin went out of existence, though he was a large holder or the stock of its successor and always manifested much interest in its affairs.

His full name is Charles Joseph Baker. He was born May 28, 1821, at "Friendsbury," an old family estate belonging to bis father, but Which is now a part of Baltimore city, being in the northwestern section. Baker Circle was a portion of this estate, and the circle gets its name from the former owners of the land. He received his early education in the schools of this city, and was graduated from Dickinson College in 1841. He then entered his father's counting-room, and was continuously engaged in the business of manufacturing window glass and dealing in paints and oils. In 1865 Mr. Baker secured the whole control of this business and admitted to the firm two of his sons. William and Charles E. Baker. With his brother, **Henry J. Baker**. Mr. Charles J. Baker established a branch of the business in New York city.

Mr. Baker became an active leader in the municipal reform movement of 1859 and 1800. He was elected to the Second Branch of the City Council on the same ticket with the late George William Brown, and although the youngest member of that body was chosen its president. He occupied this position during the stirring and memorable days of April, 1861, and the stormy period which followed. When Mayor Brown was taken prisoner and confined in Forts Lafayette and Warren, Mr. Baker was Mayor of the city ex-oifficio, serving in that capacity from September, 1861, to January, 1862. Mr. Baker used frequently to tell how he was notified that he must perform the functions of chief executive of the city by a troop of Federal soldiers riding up to his house and Informing him that as Mayor Brown was a prisoner he must take up the work of the Mayor's office.

While attending college Mr. Baker joined the Methodist Episcopal Church, and he continued a practical Christian in that faith to his death. At the outbreak of the civil war, When the Methodists as a body became involved in the sectional differences and determined to separate into the North and South Churches, Mr. Baker disapproved the separation. lie at once took an active and leading part in establishing the Independent Methodist Church.

It was largely through Mr. Baker's efforts and liberality that this church obtained such a strong foothold in Baltimore. From his private fortune he first built Chatsworth Church, tho first Independent Methodist Church in the city. He also built Bethany and Epworth churches. Friendsbury, St. John's and several other chapels for use ot Independent Methodists in various sections of the city.

...

...

Mr. Baker's first wife was Miss Elizabeth Rosserman. They had seven children, all living. One of his sons, Mr. Bernard N. Baker, Is president of the **Baltimore Storage and Lighterage Company**, and is one of the prominent business men of the city. His other children are, William, Charles E., Mary H., Richard J., Frank M. and Ashby Lee. A few years ago Mr. Baker married a second time. His widow survives him. ..

His father - William Baker (Sep 11 1781 - Mar 10 1865)

Early baker brothers - excellent history - and bottling corporation

(Source : [HW0024][GDrive])

In his need for financial backing (for The Baltimore Glass Works) (after his brother John Friese died in December 1831,), Phillip (Phillip R.J. Friese) turned to **William Baker**, a judge in the Orphans Court of the City of Baltimore and a son of the **William Baker**, who had founded **William Baker & Sons, a dry goods house**. An interest in the Baltimore Glass Works was natural, for, according to an 1837 Baltimore directory, William Baker had a glass warehouse on Hanover Street.

By 1837, William Baker had already acquired a "glass warehouse on Hanover Street" although it is unclear whether the property was only for storage of glass or if this were a glass factory. McKearin & Wilson (1978:73) were also unclear about what products were produced or stored in this "warehouse." Because this property is not mentioned further, it was likely only for storage.

In March of 1837, William Baker became involved with Friese in the Baltimore Glass Works. Baker assumed $5,650 worth of mortgages for the factory the following September and acquired the entire property a few months later. The plant was located at 3 N. Liberty St. and apparently only made window glass. It was not until January of 1845 that Baker executed the bill of sale, apparently incorporating as the Baltimore Glass Works at the same time (McKearin & Wilson 1978:73; Roller 1998).

William Baker, along with his brother, Charles [George Baker], and four associates, bought the Baltimore Glass Works in January 1845. 3 William's sons, Henry J. and Charles J. Baker began serving as commission merchants and agents, selling the products made by the Baltimore Glass Works and the New Jersey Glass Works (probably Coffin, Hay & Bowdle) under the name of C.J. and H.J. Baker in 1851. The name was changed to Baker & Bro. by 1850 and became Baker Bros. & Co. in 1851 – with Joseph Rogers, Jr., as the "& Co." 4 About 1849, the senior Baker had moved into semi-retirement (McKearin & Wilson 1878:73; Roller 1998)

GIVING AWAY THREE MILLIONS.

THE WILL OF THE LATE HENRY J. BAKER ADMITTED TO PROBATE—BEQUESTS TO RELATIVES AND FOR MISSIONARY, CHARITABLE, AND EDUCATIONAL PURPOSES.

The will and codicil of the late Henry J. Baker, the wealthy glass importer, who died on Feb. 17, were admitted to probate by Surrogate Coffin, of Westchester County, yesterday. The value of the estate disposed of is estimated at $3,000,000. By the codicil, which was executed on Dec. 8, 1876—about a year after the will—a legacy to Mrs. Amelia K. Miller is reduced from $10,000 to $5,000. The will appoints the testator's widow, Jane E. Baker, as Executrix, and John Elliott as Executor. There was no contest over the probate. The widow is given a life interest in the mansion and grounds known as Ennvillton, two adjacent houses and plots of ground, and the household furniture and library. She is also given a life interest in $100,000, with power to dispose of the same by will, besides a similar interest in $50,000, which, at her death, is to go in equal shares to William Henry Baker and Emma Hartshorn Baker, the testator's adopted children, and to the children of the latter. To the adopted son $20,000 are given absolutely on his attaining his majority, as well as the income of $30,000 more which is to go to his children after his death. The adopted daughter is given the income of $50,000 during her life, the remainder going to her children. The income of $10,000 is given for life to each of the following: Eleanor Addison Baker and Sarah Jane Baker, cousins, and Anna Jane Graves and Sophia Hollingsworth, sisters of the testator.

[HN00QN][GDrive]

After the enumeration of minor legacies, the will makes the following bequests: New-York City Church Extension and Missionary Society of the Methodist Episcopal Church, $3,000; New-York Missionary and Tract Society, $1,000; Missionary Society of the Methodist Episcopal Church, $3,000; American Bible Society, $2,000; New-York Ladies' Home Missionary Society of the Methodist Episcopal Church, $2,500; Ladies' Union Aid Society of the Methodist Episcopal Church, New-York, $2,500; Tract Society of the Methodist Episcopal Church, $1,000; Methodist Episcopal Sunday-School Union, $1,000; Wesleyan University, at Middletown, Conn., $15,000, and Methodist Episcopal Church Extention Society, Philadelphia, $3,000. The remainder of the estate is divided into six parts, one of which is to go to the testator's widow, another to his adopted son, one to his adopted daughter, two to the Wesleyan University, and the remaining one to the Methodist Episcopal Missionary Society of this City. A loan of $200,000 is left with the firm of H. J. Baker & Brother for three years, the interest on the amount to be paid quarterly or half-yearly.

The following are said to be the testator's only heirs and next of kin: Jane E. Baker, widow, of the Town of Ossining, Westchester County; Sophia Hollingsworth, Melissa Baker, Anna Jane Graves, and Olivia Warfield, his sisters, residing in Baltimore, Md.; Robert J. Baker, his brother, residing in Freedom, Carroll County, Md.: Charles J. Baker, his brother, and William B. Graves, John J. Graves, Henry M. Graves, and Elizabeth Graves, his nephews and niece respectively, all residing in Baltimore; Roswell H. Graves, a nephew, residing at Canton China, and the following-named nieces and nephew: Jane Convers, of Racine, Wis.; Mary Wyatt, of Riestertown, Baltimore County, Md.; Anna S. Reese, of this City, and Matthias L. Jones, of London, England, all being of age.

CHARLES J. BAKER.

Charles Joseph Baker, President of the **Canton Company** and head of the house of **Baker Brothers & Company**, was born in this city on the 28th of May, 1821. His parents, William and Jane Baker, then resided at "Friendsbury," their country seat, situated in what is now the growing and rapidly improving northwestern section of the city, within the corporate limits, although fifty years ago, it was considered sufficiently remote from the built-up portions of the town, to be denominated country. The paternal grandfather of Mr. Baker, who was the head of the dry goods importing house of Willam Baker & Sons, once well known in this city, came to Baltimore to make his own way in the world at the early age of twelve years, having been left an orphan by the massacre of his parents and all the other members of the family, by the Indians, about the year 1750. The scene of the massacre was near the foot of the Blue Ridge Mountains, not far from the present town of Reading, in Pennsylvania. The grandfather of Charles J. Baker, on the mother's side, was Richard Jones, who emigrated to this country from Caernarvonshire, in Wales, in 1781, preceding his family, in order to provide a home for them, before sending for wife and children to join him. He settled in Baltimore, in the part of the city which has retained the name of Fell's Point, and began business as a manufacturer and dealer in paints and oils, a branch of commerce which three generations of his descendants have since continued. In 1793, Mr. Jones purchased and improved the beau tiful site to which he gave the name of "Friendsbury," where the parents of Mr. C. J. Baker resided until their death, a few years since, and where the subject of this sketch was born. Like large numbers of his countrymen, Mr. Jones in early life, before his emigration to America, became a member of the Wesleyan Methodist Society, under the preaching and influence of its celebrated founder, whose personal acquaintance he enjoyed.

Charles J. Baker received his early education at home, and at boarding school, at the Franklin Academy in Reisterstown, Baltimore county, then under the charge of Mr. N. C. Brooks. After wards, he was sent for a short time to St. Mary's College, in this city, and, in 1835, entered the grammar school of Dickinson College, Carlisle, Pa. In 1837, he was admitted Freshman in the College proper, and graduated with the Class of 1841, under the presidency of the Rev. J. P. Durbin, 1). D. During his stay at Carlisle, in 1836, Mr. Baker united himself in membership with the Methodist Episcopal Church, in that place. Upon the completion of his college course, he entered the counting-room of his father, who was then engaged in the manufacture of window-glass at the old Baltimore glass works, at the foot of Federal Hill. In 1842, he started in business with his brother, H. J. Baker, on their own account, in the paint, oil, and glass trade, at No. 2 N. Liberty street. Shortly after the firm became proprietors of the Baltimore Window Glass and Bottle and Vial Glass Works, previously carried on by Shaum & Reitz. In 1843, the brothers removed to No. 42 South Charles street, and enlarged their business, until, in 1848, they were enabled to purchase the two warehouses, Nos. 32 and 34 South Charles street, and changed the stylo of the firm to that of Baker & Brother. In July, 1850, their two warehouses, with all their contents, including $75,000 worth of glass, paints, &c., were destroyed by fire. Nothing daunted by this disaster, the firm immediately commenced the work of rebuilding, and, in the course of the following year, had finished the present five story warehouses, Nos. 32 and 34, on the same site. During 1850, the two brothers, Charles J. and Henry J. Baker, organized the firm of H. J. Baker & Brother in New York city, for the purpose of conducting the same business there, and also importing French glass and chemicals. In 1851, the firm in Baltimore was changed to Baker Brothers & Company, upon the admission of a new partner, Mr. J. Rogers, Jr., and so continued until 1865, when Charles J. Baker purchased the entire interest of H. J. Baker and Mr. Rogers, and admitted his two sons, William Baker, Jr., and Charles E. Baker, into copartnership, retaining the old style of Baker Brothers & Company.

As one of the results of a successful business career, as well as of the enterprising and liberal spirit which has contributed so largely to that success, Mr. Baker has become prominently and usefully identified with various mercantile and manufacturing interests in this city. In 1859, he was elected a director in the Franklin Bank, and in 1867, was chosen its president. In 1860, he was elected a director in the **Canton Company** , and in 1870, was elected president, He is also interested in the Maryland White Lead Company, the Maryland Manufacturing and Fertilizing Company, and other kindred enterprises of associated capital and skill.

Through the energetic efforts of Mr. Baker, as president of the **Canton Company** , the Union Railroad, running from the north western limits of the city to tidewater, is being rapidly pushed for ward, and will be of immense service to the business of Baltimore.

Nor have Mr. Baker's life and energies been so far absorbed in business pursuits and undertakings, as to make him neglectful of other and higher duties. His life as a citizen has not been uneventful. In 1859-60, he took an active part in the Municipal Reform movement of that year, and was a candidate for the second branch of the City Council on the same ticket with George William Brown, for Mayor, and was elected by a large majority. In the organization of the branch, although the youngest member, Mr. Baker was elected president ; which position he continued to till during the stormy and memorable days of April, 1861, and the period which followed,—acting as Mayor of the city, *ex officio*, from September, 1861, to January, 1862, while Mayor Brown was a prisoner in Forts Lafayette and Warren.

The interest in religious matters which led Mr. Baker to identify himself early in life with the Methodist Episcopal Church has never failed or ceased. In 1855, he was associated as trustee of Baltimore City Station with the late R. G. Armstrong, David Thomas, John G. Chappell, Dr. Roberts, and others, and was connected and prominently identified with various religious movements and enterprises, such as the extension and rebuilding of the Eutaw Street M. E. Church, the erection of the Madison Avenue M. E. Church, and in the cause of missions, particularly the German Mission, under Dr. Jacoby, in Bremen, Frankfort, and elsewhere in Germany. As one of the trustees of Dickinson College, he manifested his interest and kept alive his connection with the Alma Mater of his youth. The dissensions, however, which disturbed the peace of the Metho dist Episcopal Church after 1860, led to Mr. Baker's withdrawal from the position which he held in that body. He assisted in organizing the Chatsworth Independent Methodist Church, and in build ing the present church edifice at the corner of Franklin and Pine streets, and, subsecpiently, in 1867, he aided in building the Bethany Independent Methodist Chapel at Franklin Square.

The leading traits of Mr. Baker's character may be readily in ferred from the foregoing incidents in his career. Energy and probity in business ; a high sense of duty in all the relations of life, public and private; a spirit and temper firm in the recognition and advocacy of principle, yet withal kindly and conciliatory, and always governed by the rules of Christian charity, and a liberal heart and hand in the support of all undertakings, secular or religious, which commend themselves to his sympathy and judgment, have made Mr. Baker widely respected, trusted and esteemed in this community.

Mr. Baker married, in 1842, Miss Elizabeth Bosserman, of Car lisle, Pa., daughter of Ephraim Bosserman, a merchant of that place.

CHARLES J. "BAKER DEAD.

Hae Had Been in Failing Health for a Long Time.

AND THE END WAS NOT UNEXPECTED.

His Active Career In Business Affairs - Manufacturer, Banker and, at One Time, Newspaper Proprietor - Prominent In Methodist Church Work.

Mr. Charles J. Baker, head of the firm of Baker Bros. & Co., died yesterday at "Athol," his country home on the Frederick turnpike.

He had been in failing health for a long time and his death was not unexpected. He was afflicted with diabetes, which caused his death. In March last Mr. Baker bad two strokes of paralysis within five days and commenced to fail from that time, though bis Vigorous constitution and strong will-power enabled him to withstand these attacks. When he recovered from this prostration he continued bis active business pursuits and bad given almost daily attention to his many enterprises until last Monday. Da that day he ordered his carriage to drive Into town, as was his custom, and while waiting for it be was taken suddenly sick and went to bed, from which he never arose.

Mr. Baker was widely known as one of the oldest and most successful business men of Baltimore. Besides being the head of the firm of **Baker Bros. & Co.**, in which house he commenced his business career more than City years ago, he was also interested in many other enterprises In and around Baltimore. Among these were the **Baltimore Car Wheel Company**, **St. Clair-Scott Manufacturing Company**, Equitable National Bank and the **Canton Company** .

While president of the **Canton Company** , in 1870, Mr. Baker was largely instrumental in securing the construction of the **Union Railroad and tunnel**, now owned by the **Pennsylvania Railroad**, and which gives the Northern Central and Western Maryland Roads tide water terminals at **Canton, Baltimore, Maryland** .

For more than twenty years Mr. Baker was president of the old **Franklin Bank**, on South street, which a few years ago was merged into the **Equitable National Bank**. The Franklin was a State bank and under Mr. Baker's direction was for some years successfully conducted. He retired from active banking business when the old Franklin went out of existence, though he was a large holder or the stock of its successor and always manifested much interest in its affairs.

His full name is Charles Joseph Baker. He was born May 28, 1821, at "Friendsbury," an old family estate belonging to bis father, but Which is now a part of Baltimore city, being in the northwestern section. Baker Circle was a portion of this estate, and the circle gets its name from the former owners of the land. He received his early education in the schools of this city, and was graduated from Dickinson College in 1841. He then entered his father's counting-room, and was continuously engaged in the business of manufacturing window glass and dealing in paints and oils. In 1865 Mr. Bakor secured the whole control of this business and admitted to the firm two of his sons. William and Charles E. Baker. With his brother, Henry J. Baker. Mr. Charles J. Baker established a branch of the business in New York city.

Mr. Baker became an active leader in the municipal reform movement of 1859 and 1800. He was elected to the Second Branch of the City Council on the same ticket with the late George William Brown, and although the youngest member of that body was chosen its president. He occupied this position during the stirring and memorable days of April, 1861, and the stormy period which followed. When Mayor Brown was taken prisoner and confined in Forts Lafayette and Warren, Mr. Baker was Mayor of the city ex-oifficio, serving in that capacity from September, 1861, to January, 1862. Mr. Baker used frequently to tell how he was notified that he must perform the functions of chief executive of the city by a troop of Federal soldiers riding up to his house and Informing him that as Mayor Brown was a prisoner he must take up the work of the Mayor's office.

While attending college Mr. Baker joined the Methodist Episcopal Church, and he continued a practical Christian in that faith to his death. At the outbreak of the civil war, When the Methodists as a body became involved in the sectional differences and determined to separate into the North and South Churches, Mr. Baker disapproved the separation. lie at once took an active and leading part in establishing the Independent Methodist Church.

It was largely through Mr. Baker's efforts and liberality that this church obtained such a strong foothold in Baltimore. From his private fortune he first built Chatsworth Church, tho first Independent Methodist Church in the city. He also built Bethany and Epworth churches. Friendsbury, St. John's and several other chapels for use ot Independent Methodists in various sections of the city.

At one time Mr. Baker purchased a controlling Interest in the Baltimore Gazette, a daily paper formerly published in this city. It was said that Mr. Baker thought he could extend his sphere of usefulness in advancing the material welfare of the city by controlling a newspaper with which to promulgate his ideas of what was best for the city's interests. His other large business enterprises, however, prevented him from giving the necessary attention to the newspaper. He soon sold bis Interest in the Gazette.

Mr. Baker's first wife was Miss Elizabeth Rosserman. They had seven children, all living. One of his sons, Mr. Bernard N. Baker, Is president of the **Baltimore Storage and Lighterage Company**, and is one of the prominent business men of the city. His other children are, William, Charles E., Mary H., Richard J., Frank M. and Ashby Lee. A few years ago Mr. Baker married a second time. His widow survives him.

Mr. Baker has always lived at "Athol." In 1880, during the sequi-centennlal celebration, Mr. Baker and his family were away from borne and on returning found the house afire. When the lire was first seen by him Mr. Baker supposed it was a bonfire as part of the celebration, and when he reached his grounds he found the house and its contents destroyed. He at once built the magnificent, residence that now occupies the high hill on his land.

Rev. J. W, Jones, pastor of Bethany Independent Methodist Church, announced to the congregation last night the death of Mr. Baker. '

His father - William Baker (Sep 11 1781 - Mar 10 1865)

Early baker brothers - excellent history - and bottling corporation

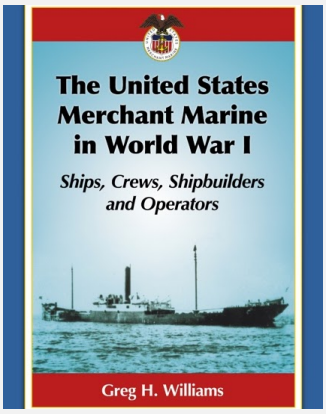
(Source : [HW0024][GDrive])

In his need for financial backing (for The Baltimore Glass Works) (after his brother John Friese died in December 1831,), Phillip (Phillip R.J. Friese) turned to **William Baker**, a judge in the Orphans Court of the City of Baltimore and a son of the **William Baker**, who had founded **William Baker & Sons, a dry goods house**. An interest in the Baltimore Glass Works was natural, for, according to an 1837 Baltimore directory, William Baker had a glass warehouse on Hanover Street.

By 1837, William Baker had already acquired a "glass warehouse on Hanover Street" although it is unclear whether the property was only for storage of glass or if this were a glass factory. McKearin & Wilson (1978:73) were also unclear about what products were produced or stored in this "warehouse." Because this property is not mentioned further, it was likely only for storage.

In March of 1837, William Baker became involved with Friese in the Baltimore Glass Works. Baker assumed $5,650 worth of mortgages for the factory the following September and acquired the entire property a few months later. The plant was located at 3 N. Liberty St. and apparently only made window glass. It was not until January of 1845 that Baker executed the bill of sale, apparently incorporating as the Baltimore Glass Works at the same time (McKearin & Wilson 1978:73; Roller 1998).

William Baker, along with his brother, Charles [George Baker], and four associates, bought the Baltimore Glass Works in January 1845. 3 William's sons, Henry J. and Charles J. Baker began serving as commission merchants and agents, selling the products made by the Baltimore Glass Works and the New Jersey Glass Works (probably Coffin, Hay & Bowdle) under the name of C.J. and H.J. Baker in 1851. The name was changed to Baker & Bro. by 1850 and became Baker Bros. & Co. in 1851 – with Joseph Rogers, Jr., as the "& Co." 4 About 1849, the senior Baker had moved into semi-retirement (McKearin & Wilson 1878:73; Roller 1998)



[HB0024][GDrive]

Atlantic Gulf & West Indies Steamship Lines
11 Broadway, Rm 1256, New York

Galen L. Stone was president, Alexander R. Nichol secretary-treasurer. Incorporated with a capital of $40,000,000. Edward J. Berwind, William A. Bradford, Henry Hornblower, Henry R. Mallory, Hubert E. Rogers, Frederick Fletcher, Harry H. Raymond, Alfred G. Smith, and Franklin D. Mooney were directors. Prior to the war the company owned the steamers *Altamaha*, *Brunswick*, *Ocmulgee*, *Ogeechee*, *Ossabaw*, and *Satilla*.

Atlantic Refining Co.
3144 W. Passyunk Ave., Philadelphia

Atlantic Refining was a subsidiary of Standard Oil. John Wesley Van Dyke worked his way up from roughneck to become manager in 1903. In 1911 the Supreme Court busted up Standard Oil and Atlantic Refining became a separate company to refine, market, and transport petroleum products. Van Dyke became president, Walter P. Cutler and William M. Irish were vice-presidents, Henry S. Mustin was treasurer, and William D. Anderson secretary.
The company owned seven ships when the war started and operated eight Shipping Board ships.

Atlantic Transport Co.
9 Broadway, Rm 268, New York

Charles Joseph Baker, of Baltimore, was president of the Franklin Bank, Baker Bros. & Co., and the Chemical Company of Canton. Baker Bros. were dealers in Lykens Valley, Sunbury and hard coal, "By the ton or cargo," and they manufactured Baltimore Window Glass, Flint & Green Glassware, chemicals, paints, oils, and glue and imported French window glass. Baker Bros. & Co. and the Chemical Company of Canton were at 32–34 S. Charles St.
Bernard Nadal Baker was secretary of the Chemical Company of Canton and in 1888 was in business with James S. Whiteley and Ashby L. Baker as the Baker, Whiteley Coal Co. at 409 Second St. and Bernard was president of the Baltimore Storage & Lighterage Co., steamship agents and ship brokers at 409 Second St. Charles G. Helm was secretary.
At that time, several steamship companies provided service from Baltimore to Europe and the British Isles. Bernard wanted to expand his business and in 1890 started the Atlantic Transportation Line in the office of the Baltimore Storage & Lighterage Co. Baker was president, James Whiteley vice-president, Charles G. Helm secretary, and James C. Gorman manager. Because the cost to build and operate American ships was about 30 percent higher than in England, Baker chose to build and operate under the British flag, but English law prohibited direct foreign ownership of English vessels so the company hired an agent, Alfred S. Williams, and formed the Atlantic Transport Co., Ltd., in London to own the ships and lease them to the Atlantic Transport Co. in New York. All the stock in the London company was owned in New York. The first British ship was the *Surrey* and eventually the company operated 16 foreign-built ships. About 80 percent of the stock ownership was American with Baker owning just over 50 percent of that. Next was Harlan & Wolf, Alexander Brown & Sons, and investors in New York, Chicago, and Baltimore.
In 1891 the Atlantic Transport Line of Steamers offered weekly sailings between Baltimore and London on the *Michigan*, *Mississippi*, *Minnesota*, *British Crown*, *Maryland*, *Maine*, *Memphis*, and *Montana*. The company acted as agents for the Hamburg American Packet Line and the Lord Line. Freight was handled by Baltimore Storage and the company opened offices in Chicago and St. Louis.
In 1897 Atlantic Transport was at 403–409 Water St. and had offices in New York, Chicago, Philadelphia, and Minneapolis. The *Maine*, *Massachusetts*, *Manitoba*, *Mohawk*, *Mobile*, *Minnesota*, *Mississippi*, *Maryland*, *Missouri*, and *Montana* ran between Baltimore, Philadelphia, New York, London, and Swansea. The company added the Bristol Channel Line and the Empire Line to its agency roster and had offices in Chicago, New York, St. Louis, and Philadelphia.
1n 1898 the U.S. government purchased Atlantic Transport's ships for the Spanish-American War. To replace his ships, Baker found investors and incorporated the Atlantic Transport Company of West Virginia with a capital of $3,000,000 and moved to offices on the 5th floor of the Continental Trust Building. Charles Helm was treasurer and Wade Newcomer was secretary. Baker replaced the confiscated ships with ships from the Wilson & Furness-Leyland Line, the famous "Minnies": *Minneapolis*, *Minnehaha*, *Minnetonka*, and *Minnewaska* and acquired other ships.
In 1901 Baker sold his stock to the International Mercantile Marine Corp., but not the ships. The voting trustees were John "J.P." Morgan, J. Bruce Ismay, Clement A. Griscom, and Peter A.B. Widener. Four new ships were ordered from American yards for Atlantic Transport with IMM money: the *China*, *Korea*, and two big liners *Manchuria* and *Mongolia*.
Financial difficulties ensued and in 1904 the IMM bloc sold the *Manchuria* and *Mongolia* to the Pacific Mail Steamship Co. Atlantic Transport was then

[HB0025][GDrive]

reorganized. Baker moved to an office at 504 Union Trust Building. James Whiteley became president of the Baker-Whiteley Coal Co. and the L.H. Miller Safe & Iron Works. James Gorman was the resident manager in Baltimore at 201–207 Chamber of Commerce Building and Arthur W. Robson was the passenger agent at 127 E. Baltimore St.
In August 1915, Pacific Mail announced that the La Follette Seamen's Act of 1915 made it impossible for them to compete against Japanese operators in the Pacific so they were selling their liners *Korea*, *Siberia*, *China*. The Atlantic Transport Company of West Virginia would buy back the *Manchuria*, and *Magnolia* for $5,250,000. The last trip to the Orient would be made by the *Mongolia* on August 25. Philip A.S. Franklin said the liners would be put on trans–Atlantic service "under the American, British, or any other flag depending on which gives the lowest cost."
Pacific Mail said they would put their eight remaining ships on coastwise routes between San Francisco and Panama and sell them before the end of the year.
Bernard Baker was born in Baltimore on May 11, 1854, to Charles Joseph and Elizabeth Baker. He was president of the Atlantic & Pacific Transport Co., the Baltimore Trust & Guarantee Co. and with Albert Ballin was the agent for the Hamburg-American Line. He died at Santa Barbara, California, on December 20, 1918, where he had moved on advice of his doctors.
In 1918 Philip A.S. Franklin was president, John J. McGlone secretary, and Horace B. Phillips treasurer. The company's three ships, *Manchuria*, *Mongolia*, and *Minnesota* were requisitioned by the Shipping Board and bareboat chartered to the Navy for operation by the Army.

Axim Transportation Co., Inc.
Anchorage, Kentucky

Charles C. Mengel established the Mengel Box Co. in 1877 at Louisville, Kentucky, to manufacture wooden boxes. In 1899 the lumber division became a separate entity at 311 W. Main St. as C.C. Mengel & Bro. Co. with Clarence R. Mengel as president. The company also distributed Santa Rosa Coffee and imported chicle and cocoa.
The company had a large logging operation at Axim on the west coast of Africa and in 1915 they incorporated Axim Transportation to handle increasing shipments by water. The company owned and chartered vessels.

Balestrand Navigation Corp.
27 William St., Rm 814, New York

A Norwegian firm that owned one ship, the *Balestrand*, which they sold in February 1918.

Baltimore & Carolina Steamship Co.
607 Union Trust Building, Baltimore

Owned three ships, managed two, and operated five Shipping Board steamers. Provided service from Baltimore to Wilmington, Charleston, and Georgetown in the Carolinas. Mason L. Weems Williams was president and general manager. The company owned the *Georgeanna Weems*, *Matilda Weems*, and *Sarah Weems* after the war.

Barber & Co., Inc.
17 Battery Place, Rm 1026, New York

Incorporated on July 13, 1917, in New York with a capital of $1,000,000 'to engage in a transportation and navigation business." James Barber was president, Edward J. Barber, Francis M. Wilson, Frank B. Mackay, and Aaron Houtman were vice-presidents. Later incorporated with a capital of $500,000 to act as steamship agents. Philip P. Barber and Oakley Wood were directors.
The company owned five freighters: *Dochra*, *Macona*, *Onega*, *Satsuma*, and *Suruga*. The *Macona* and *Onega* were incorporated under their own names. The *Dochra* was incorporated as the La Plata Steamship Co., and the *Satsuma* and *Suruga* were incorporated as the New York & Oriental Steamship Co.
The company's freighter *Suruga* was requisitioned by the Shipping Board on a time charter basis for operation by the company on the Army's account.
The company owned four ships in 1914, managed 6 Shipping Board steamers, operated seven, and managed and operated another 24 ships. The company operated the Dutch freighter *Tjikembang* under Shipping Board management. On January 9, 1918, the Shipping Board chartered the Chinese steamer *Hwah Yih* and delivered the ship to Barber on February 1 for operation to the Orient.
The Shipping Board chartered the Norwegian steamer *Bjornefjord* on September 28, 1918, and assigned the ship to the company on January 23, 1919, for operation to the east coast of South America for 12 months.
The Shipping Board bareboat chartered the Uruguayan steamer *Artigas* (ex–*Wiegand*) and *Paysandu* (ex–*Bahia*) on May 24, 1918, and assigned the ship to the company on November 7, 1918, for service from the United States to Montevideo.

[HB0023][GDrive]

CHARLES E. BAKER, of Baker Bros., Manufacturers of Glass, 26 and 38 S. Charles street, is a son of Charles J. Baker and Elizabeth (Basserman) Baker, and was born in Baltimore, February 5, 1845. [...]. [His father Charles Joseph Baker] had nine children, eight of whom are living [as of 1898], William, Jr., George B., president of the Third National Bank; Bernard N., Richard J., Frank M., Ashby Lee Baker, who resides in Raleigh, N. C., and is a cotton manufacturer, and Mrs. Mary H. Bradenbaugh, wife of Rev. A. E. Bradenbaugh, and the subject of this sketch; all reside in Baltimore except Ashby Lee. [...] Mr. Baker was educated in the private schools of Baltimore, but quit school at thirteen years of age, when he went into the service of the firm of Baker Bros., glass manufacturers, working for one dollar a week. This firm was founded in 1857 by Mr. Baker's father and uncle and has continued to do business under that firm name up to the present time, forty years. Mr. Baker, after working with the firm as clerk, salesman, etc., in 1865 became a partner in the firm, and today is the head of the house of Baker Bros., and has the chief management of their large business. not only at their glass factory, but at their warehouse and general offices, 36 and 38 S. Charles street. Mr. Baker has been married twice, having married sisters, the daughters of Benjamin Whitely and Elizabeth W. Stone, whose great-grandfather was one of the most distinguished gentlemen of that day, and a signer of the Declaration of In dependence. His first wife was Mary E. Whitely, and his second Hattie Stone Whitely, and he was first married February 5, 1867, and on the decease of his first wife married again; he had ten children, nine of whom are living: William H., who is secretary of the Chemical Company, Canton; Charles J., Jr.; Mary E.; Benjamin W., who is in business in Raleigh, N. C.; Hattie S., Florence L., Edith M., Emma R. and Virginia Baker. Mr. Baker and his family are Protestants and are members of the Methodist Episcopal Church. In politics he is a Democrat, but takes no part in such matters, only to vote, he being strictly a business man, and his large business matters requiring all his attention. With the public and among his business associates he stands high and is noted as a man of fine business qualities and sterling honesty and worth. He is, besides being identified with his own business enterprises, president of the Chemical Company, of Canton, treasurer of the 'Baltimore Guano Company, treasurer and member of the Board of Managers of the Baltimore General Dispensary, one of the oldest charities of the State of Maryland. His home is at 1405 Eutaw Place.

Bernard N. Baker of Baltimore, a retired capitalist shipping expert and formerly a member of the U.S. Board, died at Santa Barbara, Cal., on Dec 20. Mr. Baker, who had helped in the drafting of the Ship Purchase Act, was appointed a member of the Shipping in Dec 1916, but he resigned the following month, his withdrawal having occurred as a result of a suggestion by Secretary of the Treasury McAdoo that Mr . Baker consider letting the Chairmanship (upon which Mr. Baker had evidently counted), go to the Pacific Coast, then represented by William Denman on the Board. Mr. Baker was one of the four recognized transportation experts selected by Secretary McAdoo for the National Sub-Committee on Transportation Problems. Before his appointment to the Shipping Board Mr. Baker acted as an expert adviser to the Administration in connection with its effort to have the Government own and operate a line of merchant steamships. Mr. Baker was President of the Atlantic & Pacific Transport Co., formerly President of the Baltimore Trust & Guarantee Co., and a director in many commercial enterprises. He was a member of the Moral Education Board and actively interested in moral education. Mr. Baker at the time of his death was 64 years of age. He had gone to Santa Barbara on the advice of his physician and his death occurred after an illness of three days.

See History of Baltimore : [HB0023][GDrive]

1876 - Partneship with James Stone Whiteley in 1876, Starting business Baker & Whiteley

Bernard Nadal Baker Formed a partnership with **James Stone Whiteley** in 1876, Starting business **Baker & Whiteley**, for conducting the coal business in Baltimore [HB0023][GDrive] .

1881 - Established Atlantic Transport Line (A.T.L.)

In 1881, with the support of the Pennsylvania Railroad (which wanted a transatlantic outlet for its freight business) Baker established the 🔵Atlantic Transport Line (A.T.L.). See saved Wikipedia at [HK001H][GDrive] .

1887 - Baker-Whiteley Coal Company

In 1887 Mr. Whiteley with Mr. Baker incorporated the **Baker-Whiteley Coal Company** [HB0023][GDrive] .

Subsequently they purchased the **Rohr Scow Company,** and incorporated that under the name of the **Baltimore Storage and Lighterage Company**, for the purpose of conducting a foreign steamship business. At the same time they organized the **Atlantic Transport Line**, and acquired the ownership of steamships engaged in business between New York, Philadelphia, Baltimore and London, which [as of 1898] was composed of a fleet of fifteen steamers.

JAMES STONE WHITELEY, offices Rialto Building, Water street, Baltimore.—This gentleman was born in Baltimore, November 16, 1855. He is the son of Calvin Whiteley and Harriet H. (Stone) Whiteley. His parents were born in Maryland, and were of English descent. His father was for many years interested in and a member of the firm of Whiteley, Brother & Co., dry goods jobbers of this city; one of the leading houses of this line in Baltimore at the time. His mother died in 1872; his father is still living, being a resident of Baltimore, and having retired from active business some years since.

Mr. James S. Whiteley had two brothers, one of whom is now living, viz., Calvin Whiteley, Jr., civil engineer. Mr. James S. Whiteley was educated at Stewart Hall, of which Messrs. Grape and Hartman were the principals. He also for a short time at tended the school of Mr. George Carey. He entered active service as entry clerk in the employ of Messrs. Whiteley, Brother & Co. when seventeen years of age. After serving in this capacity for a short time, he was promoted to stock clerk and then put on the road as a drummer, meeting with considerable success in this latter occupation. In 1876 Mr. Whiteley left the employ of the firm of Messrs. Whiteley, Brother & Co., and started in business for himself—-he and Mr. Bernard N. Baker forming a partner ship under the name of Baker & Whiteley, for conducting the coal business in Baltimore. They were the pioneers of the Pennsylvania coal trade at Baltimore, and gradually worked up a large business at this Port, introducing Pennsylvania ooals in successful competition with those supplied from the George's Creek region.

In 1887 Mr. Whiteley with Mr. Baker incorporated the Baker-Whiteley Coal Company. Subsequently they purchased the Rohr Scow Company, and incorporated that under the name of the Baltimore Storage and Lighterage Company, for the purpose of conducting a foreign steamship business. At the same time they organized the Atlantic Transport Line, and acquired the ownership of steamships engaged in business between New York, Philadelphia, Baltimore and London, which is now composed of a fleet of fifteen steamers.

Mr. Whiteley is the vice-president and general manager of the Baker-Whiteley Coal Company and also vice-president of the Baltimore Storage and Lighterage Company.

The above companies employ over two thousand people in their ofiices in America and England, and transport between two and three million tons of merchandise and coal each year.

1901

The 🌐Atlantic Transport Line was was folded into the 🌐International Mercantile Marine shipping trust (IMM).

INGLESIDE

Barnard Nadal Baker had his fulltime residence, known as 🌐**Ingleside**.

"In 1877 Baker married Elizabeth Elton Livzey. In 1889 Baker incorporated the 🌐Atlantic Transport Line in London, and chose to start construction of the Ingleside Mansion.

The mansion was built on 300 acres (120 ha) of property that Baker inherited and an adjoining parcel he purchased. The building was based on an English home, with 49 rooms. The outside was clad in fieldstone. The roof was red tile. Fireplace mantles were hand carved. Several tenant houses and a formal garden were built on the property.[2] A world traveler, Baker described Ingleside as his only true home."

In April 1918, the Bakers turned the mansion over to Company C of the food production committee of the women's section of the Maryland defense council to support the war efforts. Women farmers would tend crops for $1.20 a day, compared to the going rate of $2.00 a day for male labor. There was some resistance in the community to using women laborers. Governor Emerson Harrington gave a speech at the mansion porch in support of the efforts in July 1918. Troops were also able to live at the house and commute to war-effort jobs. Most of Baker's ships were lost in the war. He died later that year in California.

Ingleside burned down in 1953.

Nearby Ingleside Avenue is named for the mansion. Baker Avenue is named after its original builder, Benard M. Baker.

Background

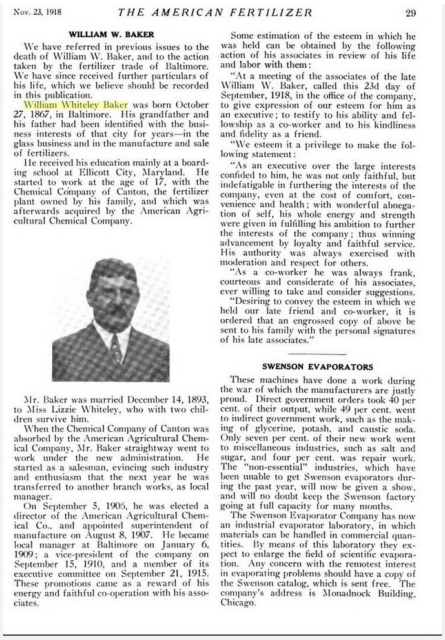
The American Agricultural Chemical Company (or AACC) was led for many years by William Whitely Baker Sr., who passed in 1918 . His legend was called out here in the American Fertilizer 1918 issue.

"

In 1843, WILLIAM BAKER bought the "Baltimore Window-Glass Works" - the oldest glass works in the United States with an outstanding reputation for superior quality.

1845, HENRY J. and CHARLES J. BAKER, sons of WILLIAM BAKER, became connected with these works and in 1850 were enlisted by their father to obtain sources for glass produced in Europe. Henry J. Baker obtained sourcing for the glass trade but could not return to import glass via the port of Baltimore in competition with his family's firm."

November 23 1918 issue of "The American Fertilizer" (For PDF with all 1918 issues, see [HP0018][hGDrive]).



Nov. 23, 1918 THE AMERICAN FERTILIZER 29

WILLIAM W. BAKER

We have referred in previous issues to the death of William W. Baker, and to the action taken by the fertilizer trade of Baltimore. We have since received further particulars of his life, which we believe should be recorded in this publication.

William Whiteley Baker was born October 27, 1867, in Baltimore. His grandfather and his father had been identified with the business interests of that city for years—in the glass business and in the manufacture and sale of fertilizers.

He received his education mainly at a boarding school at Ellicott City, Maryland. He started to work at the age of 17, with the Chemical Company of Canton, the fertilizer plant owned by his family, and which was afterwards acquired by the American Agricultural Chemical Company.

Mr. Baker was married December 14, 1893, to Miss Lizzie Whiteley, who with two children survive him.

When the Chemical Company of Canton was absorbed by the American Agricultural Chemical Company, Mr. Baker straightway went to work under the new administration. He started as a salesman, evincing such industry and enthusiasm that the next year he was transferred to another branch works, as local manager.

On September 5, 1905, he was elected a director of the American Agricultural Chemical Co., and appointed superintendent of manufacture on August 8, 1907. He became local manager at Baltimore on January 6, 1909; a vice-president of the company on September 15, 1910, and a member of its executive committee on September 21, 1915. These promotions came as a reward of his energy and faithful co-operation with his associates.

Some estimation of the esteem in which he was held can be obtained by the following action of his associates in review of his life and labor with them:

"At a meeting of the associates of the late William W. Baker, called this 23d day of September, 1918, in the office of the company, to give expression of our esteem for him as an executive; to testify to his ability and fellowship as a co-worker and to his kindliness and fidelity as a friend.

"We esteem it a privilege to make the following statement:

"As an executive over the large interests confided to him, he was not only faithful, but indefatigable in furthering the interests of the company, even at the cost of comfort, convenience and health; with wonderful abnegation of self, his whole energy and strength were given in fulfilling his ambition to further the interests of the company; thus winning advancement by loyalty and faithful service. His authority was always exercised with moderation and respect for others.

"As a co-worker he was always frank, courteous and considerate of his associates, ever willing to take and consider suggestions.

"Desiring to convey the esteem in which we held our late friend and co-worker, it is ordered that an engrossed copy of above be sent to his family with the personal signatures of his late associates."

SWENSON EVAPORATORS

These machines have done a work during the war of which the manufacturers are justly proud. Direct government orders took 40 per cent. of their output, while 49 per cent. went to indirect government work, such as the making of glycerine, potash, and caustic soda. Only seven per cent. of their new work went to miscellaneous industries, such as salt and sugar, and four per cent. was repair work. The "non-essential" industries, which have been unable to get Swenson evaporators during the past year, will now be given a show, and will no doubt keep the Swenson factory going at full capacity for many months.

The Swenson Evaporator Company has now an industrial evaporator laboratory, in which materials can be handled in commercial quantities. By means of this laboratory they expect to enlarge the field of scientific evaporation. Any concern with the remotest interest in evaporating problems should have a copy of the Swenson catalog, which is sent free. The company's address is Monadnock Building, Chicago.

[HP0019][GDrive]

WILLIAM W BAKER We have referred in previous issues to the death of William W Baker, and to the action taken by the fertilizer trade of Baltimore We have since received further particulars of his life which we believe should be recorded in this publication.

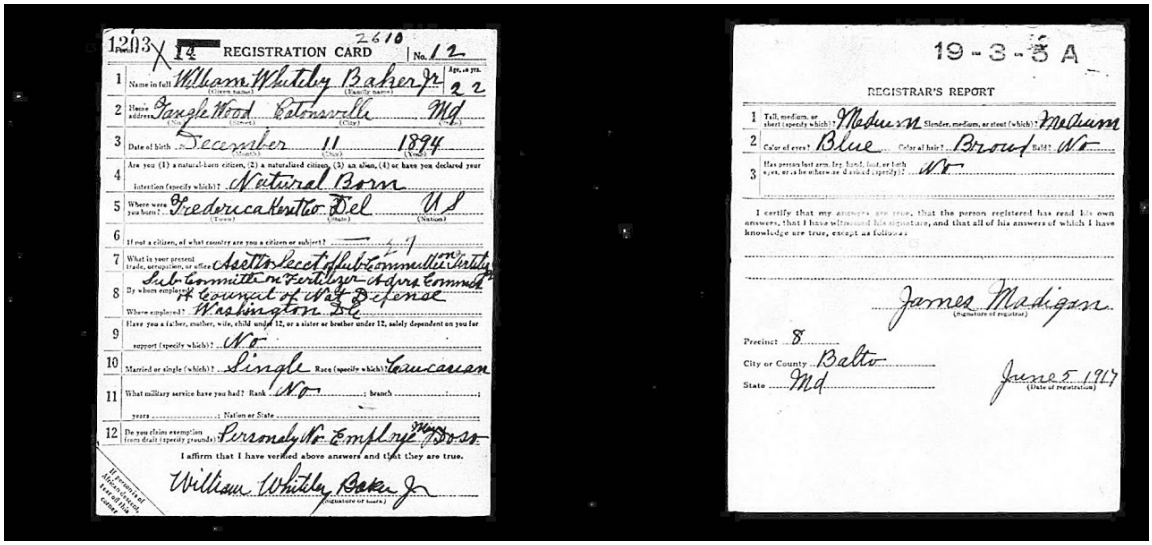
1917 (June) - Son's Draft Registration

William Whiteley Baker Jr. was 22 years of age when he registered on June 5, 1917.



1203 X 14 REGISTRATION CARD 2610 No. 12

1 Name in full: William Whitby Baker Jr. Age, in yrs. 22
2 Home address: Tangle Wood Catonsville Md
3 Date of birth: December 11 1894
4 Are you (1) a natural-born citizen, (2) a naturalized citizen, (3) an alien, (4) or have you declared your intention (specify which)? Natural Born
5 Where were you born? Fredericatown Del US
6 If not a citizen, of what country are you a citizen or subject? —
7 What is your present trade, occupation, or office? Asst to Secret of Sub-Committee Fertilizer
8 By whom employed? Council of Nat Defense
Where employed? Washington DC
9 Have you a father, mother, wife, child under 12, or a sister or brother under 12, solely dependent on you for support (specify which)? No
10 Married or single (which)? Single Race (specify which) Caucasian
11 What military service have you had? Rank No; branch ; years ; Nation or State
12 Do you claim exemption from draft (specify grounds) Personally Mo Employ Boss

I affirm that I have verified above answers and that they are true.

William Whitby Baker Jr
(signature of registrant)

If person registered cannot write, registrant's mark should be witnessed here.

19-3-3 A

REGISTRAR'S REPORT

1 Tall, medium, or short (specify which)? Medium Slender, medium, or stout (which)? Medium
2 Color of eyes? Blue Color of hair? Brown Bald? No
3 Has person lost arm, leg, hand, foot, or both eyes, or is he otherwise defined (specify)? No

I certify that my answers are true, that the person registered has read his own answers, that I have witnessed his signature, and that all of his answers of which I have knowledge are true, except as follows:

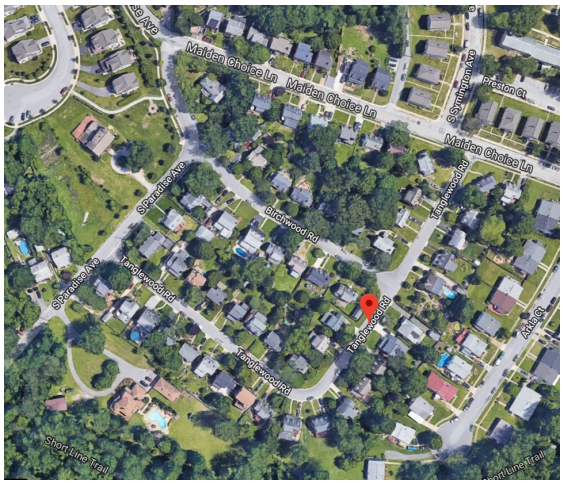
James Madigan
(Signature of registrar)

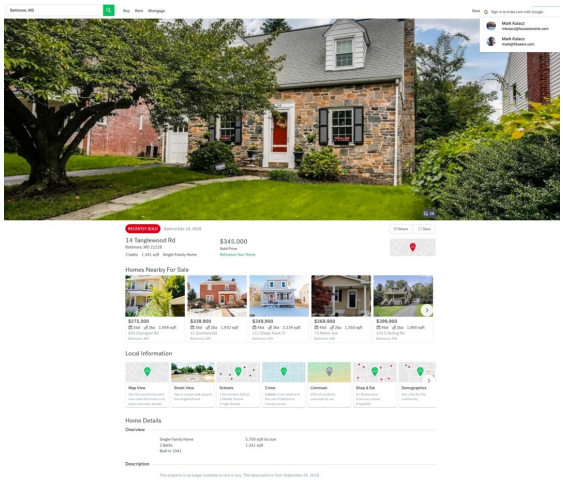
Precinct 8
City or County Balto
State Md
June 5 1917
(Date of registration)

[HG002V][GDrive]

The employer and job is hard to read, but we can see at that time it looks like **"A[??????? ?????????] of Sub-Committee on on [?????], Sub-Committee on Fertilizer [????????????] Council of National Defense"**, located in Washington D.C. .

His address looks to be "**Tanglewood Road, Catonsville, MD**". As of 2019, there doesn't appear to be any homes on this small suburban road build before 1941, so the home may have removed? Hard to tell, without a street address number.





In Catonsville, his uncle Bernard Nadal Baker (born 1854) had his full-time residence: A 49-room mansion on 300 acres known as 🔵Ingleside , .Google shows this location to be about 2 miles from the states address above.

"In 1877 Baker married Elizabeth Elton Livzey. In 1889 Baker incorporated the 🔵Atlantic Transport Line in London, and chose to start construction of the Ingleside Mansion.

The mansion was built on 300 acres (120 ha) of property that Baker inherited and an adjoining parcel he purchased. The building was based on an English home, with 49 rooms. The outside was clad in fieldstone. The roof was red tile. Fireplace mantles were hand carved. Several tenant houses and a formal garden were built on the property.[2] A world traveler, Baker described Ingleside as his only true home."

In April 1918, the Bakers turned the mansion over to Company C of the food production committee of the women's section of the Maryland defense council to support the war efforts. Women farmers would tend crops for $1.20 a day, compared to the going rate of $2.00 a day for male labor. There was some resistance in the community to using women laborers. Governor Emerson Harrington gave a speech at the mansion porch in support of the efforts in July 1918. Troops were also able to live at the house and commute to war-effort jobs. Most of Baker's ships were lost in the war. He died later that year in California.

Ingleside burned down in 1953.

Nearby Ingleside Avenue is named for the mansion. Baker Avenue is named after its original builder, Benard M. Baker.

1918 (Sep) - Death of father William Whitely Baker Sr.

William Whiteley Baker Jr's father died on Sep 22 1918 (age 50) [HL0030][GDrive] .

1923 (March) - "R. S. Mueller Company" opens in Baltimore

From the March of 1923 issue of the periodical ***"The American Fertilizer"*** (to download full PDF copies of the July-December 1923 issues, see [HP000X][GDrive]), we read that **Robert Swan Mueller I (b1893)** opened up his company **"R. S. Mueller Company"** in Baltimore. Up until not long before then, Robert Swan Mueller I was working with the United States Shipping Board, but now owned and operated his own business as a "Chemical broker", with an apparent focus on the fertilizer industry.

William Whiteley Baker Jr. (identified here as "**W. Whiteley Baker Jr.**") is an associate of the R.S. Mueller Company.

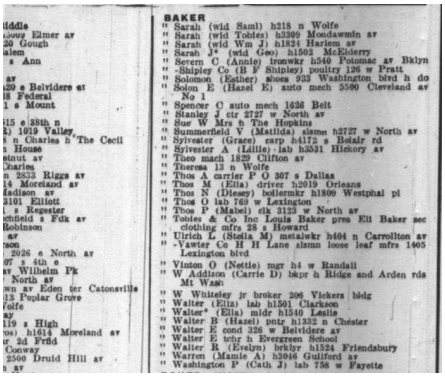
NEW BALTIMORE BROKERS

R. S. Mueller has opened an office at 206 Vickers Building, Baltimore, Md. This new concern will specialize in all kinds of fertilizer materials, chemicals and oils. W. Whiteley Baker, Jr., is associated with Mr. Mueller.

[HP000Y][GDrive]

The **R.S. Mueller Company** has several specialties including (but not limited to) Chemical brokering, Chemicals, Fertilizer materials, Fish scrap, and sulfuric acid.

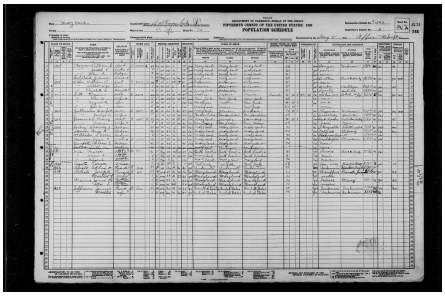
William W Baker Jr ("William Whiteley Baker Jr.") was the business colleague of Robert Swan Mueller I, starting in 1923 in Baltimore Maryland when **Robert Swan Mueller I (b1893)** started his agriculture, fertilizer, and chemical distribution business **"R.S. Mueller Co."**



The American Agricultural Chemical Company has been known since the 1950s as Agrico.

1930

Job listed as "Broker" in the "Fertilizer" industry. 36 years of age, living at home with the mother (now a widow), and his sister Elizabeth (now age 30). Their home is a rental that is $60/month.



[HS001Y][GDrive]

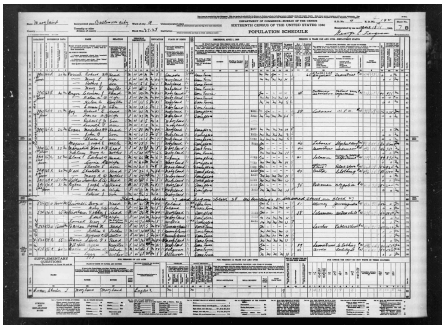
1930 - Still employed at R.S. Mueller Company

The following Google search shows that W.W. Baker Jr. is still working with (or associated with) the R.S. Mueller Company as of 1930. Unfortunately the full issue is not being shared on Google. See (1930-american-fertilizer-volume-73-google-search-wwbaker-jr-mueller-screenshot.jpg / https://drive.google.com/open?id=1QWP_3d4LaD7OmxcCYzo1e3hjLwJOmkUs) ,

---

1940 - Census (Baltimore)

Job listed as "Broker" in the "Fertilizer" industry. 46 years of age, living at home with the mother (widow, age 68). Their home is a rental that is still $60/month.



[HS001Z][GDrive]

1942 (April) - WW2 draft Registration

William Whiteley Baker Jr. resisted on April 25, 1942. At this time we see that we has 47 years of age, working at **H.J. Baker Bro** at the Md Trust Building (Maryland Trust Building).

Nobel Prize Interview with Dr. David Baltimore, 26 April 2001, Nobel Prize.org

David Baltimore: Danger from the Wild: HIV, Can We Conquer It?, iBiology

David Baltimore (born March 7, 1938) is an American biologist, university administrator, and 1975 Nobel laureate in Physiology or Medicine. He is currently President Emeritus and Distinguished Professor of Biology at the California Institute of Technology (Caltech), where he served as president from 1997 to 2006.[2] He also served as the director of the Joint Center for Translational Medicine, which joined Caltech and UCLA in a program to translate basic scientific discoveries into clinical realities. He also formerly served as president of Rockefeller University from 1990 to 1991, founder and Director of the Whitehead Institute of Biomedical Research from 1982 to 1990, and was president of the American Association for the Advancement of Science in 2007.

Baltimore has profoundly influenced international science, including key contributions to immunology, virology, cancer research, biotechnology, and recombinant DNA research, through his accomplishments as a researcher, administrator, educator, and public advocate for science and engineering. He has trained many doctoral students and postdoctoral fellows, several of whom have gone on to notable and distinguished research careers. In addition to the Nobel Prize, he has received a number of awards, including the U.S. National Medal of Science in 1999. Baltimore sits on the Board of Sponsors[3] for the Bulletin of the Atomic Scientists and as a senior scientific advisor to the Science Philanthropy Alliance.[4]

Early life and education[edit]

Baltimore in the 1970s

Baltimore was born on March 7, 1938, in New York City to Gertrude (Lipschitz) and Richard Baltimore. Raised in the Queens neighborhoods of Forest Hills and Rego Park, Queens, he moved with his family to suburban Great Neck, New York, while he was in second grade because his mother felt that the city schools were inadequate. His father had been raised as an Orthodox Jew and his mother was an atheist, and Baltimore observed Jewish holidays and would attend synagogue with his father through his Bar Mitzvah.[5] He graduated from Great Neck North High School in 1956, and credits his interest in biology to a high-school summer spent at the Jackson Laboratory's Summer Student Program in Bar Harbor, Maine.[6][7] It was at this program that he met [**Dr. Howard Martin Temin (born 1934)**], with whom he would later share the Nobel Prize.[8]

Baltimore earned his Bachelor's degree with high honors at Swarthmore College in 1960.[9] He was introduced to molecular biology by George Streisinger under whose mentorship he worked for a summer at Cold Spring Harbor Laboratory as part of the inaugural cohort of the Undergraduate Research Program in 1959.[9][5][8] There he also met two new MIT faculty, future Nobel Laureate Salvador Luria and Cyrus Levinthal who were scouting for candidates for a new program of graduate education in molecular biology.[5][8] They invited him to apply to the Massachusetts Institute of Technology (MIT).[5][8] Baltimore's future promise was evident in his work as a graduate student when he entered MIT's graduate program in biology in 1960 with a brash and brilliant approach to learning science, completing his PhD thesis work in 2 years.[10][11] His early interest in phage genetics quickly yielded to a passion for animal viruses.[5] He took the Cold Spring Harbor course on animal virology in 1961 and he moved to Richard Franklin's lab at the Rockefeller Institute at New York City which was one of the few labs pioneering molecular research on animal virology.[5] There he made fundamental discoveries on virus replication and its effect on cell metabolism, including the first description of an RNA replicase.

Career and research[edit]

After his PhD, Baltimore returned to MIT for postdoctoral research with James Darnell in 1963.[12] He continued his work on virus replication using poliovirus and pursued training in enzymology with Jerard Hurwitz at Albert Einstein College of Medicine in 1964/1965.[12]

Independent investigator[edit]

In February 1965, Baltimore was recruited by [] to the newly established Salk Institute for Biological Studies in La Jolla as an independent research associate.[13] There he investigated poliovirus RNA replication and began a long and storied career of mentoring other scientists' early careers including Marc Girard, and Michael Jacobson.[12][14] They discovered the mechanism of proteolytic cleavage of viral polyprotein precursors,[15] pointing to the importance of proteolytic processing in the synthesis of eukaryotic proteins.[16][17] He also met his future wife, Alice Huang, who began working with Baltimore at Salk in 1967.[17][18] He and Alice together carried out key experiments on defective interfering particles and viral pseudo types. During this work, he made a key discovery that polio produced its viral proteins as a single large polyprotein that was subsequently processed into individual functional peptides.[16][17]

Massachusetts Institute of Technology[edit]

Reverse transcriptase[edit]

In 1968, he was recruited once more by soon-to-be Nobel laureate Salvador Luria to the department of biology at MIT as an associate professor of microbiology.[19] Alice S. Huang also moved to MIT to continue her research on vesicular stomatitis virus (VSV). They became a couple, and married in October 1968.[18] At MIT, Huang, Baltimore, and graduate student Martha Stampfer discovered that VSV involved an RNA-dependent RNA polymerase within the virus particle, and used a novel replication strategy to replicate its RNA genome. VSV entered a host cell as a single negative strand of RNA, but brought with it RNA polymerase to stimulate the processes of transcription and replication of more RNA.[17][18][20]

Baltimore extended this work and examined two RNA tumor viruses, Rauscher murine leukemia virus and Rous sarcoma virus.[17][21] He went on to discover reverse transcriptase (RTase or RT) – the enzyme that polymerizes DNA from an RNA template. In doing so, he discovered a distinct class of viruses, later called retroviruses, that use an RNA template to catalyze synthesis of viral DNA.[22] This overturned the simplified version of the central dogma of molecular biology that stated that genetic information flows unidirectionally from DNA to RNA to proteins.[21][23][24] Reverse transcriptase is essential for the reproduction of retroviruses, allowing such viruses to turn viral RNA strands into viral DNA strands. The viruses that fall into this category include HIV.[18][22]

The discovery of reverse transcriptase, made contemporaneously with [**Dr. Howard Martin Temin (born 1934)**], who had proposed the provirus hypothesis, showed that genetic information could traffic bidirectionally between DNA and RNA. They published these findings in back-to-back papers in the prestigious

journal, Nature.[25][26] This discovery made it easier to isolate and reproduce individual genes, and was heralded as evidence that molecular and virological approaches to understanding cancer would yield new cures for the dreaded disease.[27] This may have influenced President Richard Nixon's War on Cancer which was launched in 1971 and substantially increased research funding for the disease. In 1972, at the age of 34, Baltimore was awarded tenure as a professor of biology at MIT, a post that he held until 1997.

Asilomar conference on recombinant DNA[edit]

Baltimore also helped Paul Berg and Maxine Singer to organize the Asilomar Conference on Recombinant DNA, held in February 1975. The conference discussed possible dangers of new biotechnology, drew up voluntary safety guidelines, and issued a call for an ongoing moratorium on certain types of experiments and review of possible experiments, which has been institutionalized by recombinant DNA advisory committees established at essentially all US academic institutions conducting molecular biology research.[5] Baltimore was well aware of the importance of the changes occurring in the laboratory: "The whole Asilomar process opened up to the world that modern biology had new powers that you had never conceived of before."[10]:111

MIT Cancer Center[edit]

In 1973, he was awarded a prestigious American Cancer Society Professor of Microbiology that provided substantial salary support. Also in 1973, he became one of the early faculty members in the newly organized MIT Center for Cancer (CCR), capping a creative and industrious period of his career with nearly fifty research publications including the paradigm-shifting paper on reverse transcriptase.[28] The MIT CCR was led by Salvador E. Luria and quickly achieved pre-eminence with a remarkable group of faculty including Baltimore, Phillips Robbins, Herman Eisen, Philip Sharp, and Robert Weinberg, who all went on to illustrious research careers.[19] Baltimore was honored as a Fellow of the American Academy of Arts and Sciences in 1974.[9] He returned to New York City in 1975, for a year-long sabbatical at Rockefeller University working with Jim Darnell.[13]

Nobel Prize

In 1975, at the age of 37, he shared the Nobel Prize for Physiology or Medicine with [**Dr. Howard Martin Temin (born 1934)**] and [**Dr. Renato Dulbecco (born 1914)**].[13] The citation reads, "for their discoveries concerning the interaction between tumor viruses and the genetic material of the cell."[29] At the time, Baltimore's greatest contribution to virology was his discovery of reverse transcriptase (Rtase or RT) which is essential for the reproduction of retroviruses such as HIV and was discovered independently, and at about the same time, by Satoshi Mizutani and Temin.[16]

After winning the Nobel Prize, Baltimore reorganized his laboratory, refocusing on immunology and virology, with immunoglobulin gene expression as a major area of interest. He tackled new problems such as the pathogenesis of Abelson murine leukemia virus (AMuLV), lymphocyte differentiation and related topic in immunology. In 1980, his group isolated the oncogene in AMuLV and showed it was a member of a new class of protein kinases that used the amino acid tyrosine as a phosphoacceptor.[30] This type of enzymatic activity was also discovered by Tony Hunter, who has done extensive work in the area. He also continued to pursue fundamental questions in RNA viruses and in 1981, Baltimore and Vincent Racaniello, a post-doctoral fellow in his laboratory, used recombinant DNA technology to generate a plasmid encoding the genome of poliovirus, an animal RNA virus.[15] The plasmid DNA was introduced into cultured mammalian cells and infectious poliovirus was produced. The infectious clone, DNA encoding the genome of a virus, is a standard tool used today in virology.

Whitehead Institute for Biomedical Research[edit]

In 1982, with a charitable donation by businessman and philanthropist Edwin C. "Jack" Whitehead, Baltimore was asked to help establish a self-governed research institute dedicated to basic biomedical research.[31] Baltimore persuaded Whitehead that MIT would be the ideal home for the new institute, convinced that it would be superior at hiring the best researchers in biology at the time, thus ensuring quality[8]. Persuading MIT faculty to support the idea was far more difficult. MIT as an institution had never housed another before, and concerns were raised that the wealth of the institute might skew the biology department in directions faculty did not wish to take, and that Baltimore himself would gain undue influence over hiring within the department.[8][12][32] The controversy was made worse by an article published by the Boston Globe framing the institute as corporate takeover of MIT.[8][12] After a year of intensive discussions and planning, faculty finally voted in favor of the institute.[8] Whitehead, Baltimore, and the rest of the planning team devised a unique structure of an independent research institute composed of "members" with a close relationship with the department of biology of MIT. This structure continues to this day to attract an elite interactive group of faculty to the Department of Biology at MIT and has served as a model for other distinguished institutes such as the Broad Institute.

The Whitehead Institute for Biomedical Research (WIBR) was launched with $35 million to construct and equip a new building located across the street from the MIT cancer center at 9 Cambridge Center in Cambridge Massachusetts. The institute also received $5 million per year in guaranteed income and a substantial endowment in his will (for a total gift of $135 million). Under Baltimore's leadership, a distinguished group of founding members including Gerald Fink, Rudolf Jaenisch, Harvey Lodish, and Robert Weinberg was assembled and eventually grew to 20 members in disciplines ranging from immunology, genetics, and oncology to fundamental developmental studies in mice and fruit flies.[33] Whitehead Institute's contributions to bioscience have long been consistently outstanding. Less than a decade after its founding with continued leadership by Baltimore, the Whitehead Institute was named the top research institution in the world in molecular biology and genetics, and over a recent 10-year period, papers published by Whitehead scientists, including many from Baltimore's own lab, were the most cited papers of any biological research institute. The Whitehead Institute was an important partner in the Human Genome Project.[34]

Baltimore served as director of the WIBR and expanded the faculty and research areas into key areas of research including mouse and drosophila genetics. During this time, Baltimore's own research program thrived in the new Institute. Important breakthroughs from Baltimore's lab include the discovery of the key transcription factor NF-κB by Dr. Ranjan Sen and David Baltimore in 1986.[35] This was part of a broader investigation to identify nuclear factors required for Ig gene expression in B lymphocytes. However, NF-κB turned out to have much broader importance in both innate and adaptive immunity and viral regulation. NF-κB is involved in regulating cellular responses and belongs to the category of "rapid-acting" primary transcription factors. Their discovery led to an "information explosion" involving "one of the most intensely studied signaling paradigms of the last two decades."[36]

As early as 1984, Rudolf Grosschedl and David Weaver, postdoctoral fellows, in Baltimore's laboratory, were experimenting with the creation of transgenic mice as a model for the study of disease. They suggested that "control of Ig gene rearrangement might be the only mechanism that determines the specificity of heavy chain gene expression within the lymphoid cell lineage."[37] in 1987, they created transgenic mice with the fused gene that developed fatal leukemia.[38][39]

David G. Schatz and Marjorie Oettinger, as students in Baltimore's research group in 1988 and 1989, identified the protein pair that rearranges immunoglobulin genes, the recombination-activating gene RAG-1 and RAG-2,[40] this was a key discovery in determining how the immune system can have

specificity for a given molecule out of many possibilities,[41] and was considered by Baltimore as of 2005 to be "our most significant discovery in immunology".[9]:Addendum, May 2005

In 1990, as a student in David Baltimore's laboratory at MIT, George Q. Daley demonstrated that a fusion protein called bcr-abl is sufficient to stimulate cell growth and cause chronic myelogenous leukemia (CML). This work helped to identify a class of proteins that become hyperactive in specific types of cancer cells. It helped to lay the groundwork for a new type of drug, attacking cancer at the genetic level: Brian Druker's development of the anti-cancer drug Imatinib (Gleevec), which deactivates bcr-abl proteins. Gleevec has shown impressive results in treating chronic myelogenous leukemia and also promise in treating gastrointestinal stromal tumor (GIST).[42][43][44]

Rockefeller University[edit]

Baltimore served as the director of the Whitehead Institute until July 1, 1990, when he was appointed the sixth president of Rockefeller University in New York City. He moved his research group to New York in stages and continued to make creative contributions to virology and cellular regulation.[8] He also began important reforms in fiscal and faculty management and promoted the status of junior faculty at the university.[45] After resigning on December 3, 1991 (see Imanishi-Kari case), Baltimore remained on the Rockefeller University faculty and continued research until the spring of 1994. He was invited to return to MIT and rejoined the faculty as the Ivan R. Cottrell Professor of Molecular Biology and Immunology.[8]

California Institute of Technology[edit]

From left: JPL Director Charles Elachi, La Canada-Flintridge Mayor Greg Brown, Baltimore and JPL Deputy Director Eugene Tattini (2006).

On May 13, 1997, Baltimore was appointed president of the California Institute of Technology (Caltech).[46][47][48][49][50] He began serving in the office October 15, 1997 and was inaugurated March 9, 1998.[51]

During Baltimore's tenure at Caltech, United States President Bill Clinton awarded Baltimore the National Medal of Science in 1999 for his numerous contributions to the scientific world. In 2004, Rockefeller University gave Baltimore its highest honor, Doctor of Science (honoris causa).[52]

In 2003, as a postdoctoral fellow in David Baltimore's lab at Caltech, Matthew Porteus was the first to demonstrate precise gene editing in human cells using chimeric nucleases.[53]

In October 2005, Baltimore resigned the office of the president of Caltech, saying, "This is not a decision that I have made easily, but I am convinced that the interests of the Institute will be best served by a presidential transition at this particular time in its history..." [54] [55]. Former Georgia Tech Provost Jean-Lou Chameau succeeded Baltimore as president of Caltech.[56] Baltimore was appointed President Emeritus and the Robert Andrews Milikan Professor of Biology at Caltech and remains an active member of the institute's community.[57] On January 21, 2021, Caltech president Thomas F. Rosenbaum announced the removal of the name of Caltech's founding president and first Nobel laureate, Robert A. Millikan, from campus buildings, assets, and honors due to Millikan's substantial participation in the eugenics movement. Baltimore's title was changed to "Distinguished Professor of Biology."[58]

Caltech Laboratory (1997-2019)[edit]

Baltimore's laboratory at Caltech focused on two major research areas: understanding the development and functioning of the mammalian immune system and translational studies creating viral vectors to make the immune system more effective in resisting cancer. Their basic studies went in two directions: understanding the diverse activity of the NF-κB transcription factor, and understanding the normal and pathologic functions of microRNA.

Translational Science Initiatives[edit]

A primary focus of Baltimore's lab was use of gene therapy methods to treat HIV and cancer.[59] In the early 2000's one of Baltimore's graduate students, Lili Yang, developed a lentivirus vector that allowed for the cloning of genes for two chains of TCR. Recognizing its potentially profound implications for enhancing immunity, Baltimore developed a translational research initiative within his laboratory called "Engineering Immunity." The Bill and Melinda Gates Foundation awarded the program with a Grand Challenge Grant, and he used the funding to divide the initiative into four research programs and hire additional lab staff to lead each one. Two of the research programs sparked gene therapy start-up companies, Calimmune and Immune Design Corp, founded in 2006 and 2008 respectively[60][61]. A third program focused on the development of an HIV vaccine, and eventually lead to clinical trials at NIH.[12] In 2009 Baltimore became director of the Joint Center for Translational Medicine, a shared initiative between Caltech and UCLA aimed at developing bench to bedside medicine.[59]

MicroRNA Research[edit]

A focus of Baltimore's lab from his arrival at Caltech to the lab's closure in 2018 was understanding the role of microRNA in the immune system.[12] MicroRNAs provide fine control over gene expression by regulating the amount of protein made by particular messenger RNAs.[57] In recent research led by Jimmy Zhao, Baltimore's team has discovered a small RNA molecule called microRNA-146a (miR-146a) and bred a strain of mice that lacks miR146a. They have used the miR146a(-) mice as a model to study the effects of chronic inflammation on the activity of hematopoietic stem cells (HSCs). Their results suggest that microRNA-146a protects HSCs during chronic inflammation, and that its lack may contribute to blood cancers and bone marrow failure.[62]

Splicing Control Research[edit]

Another concentration within Baltimore's lab in recent years was control of inflammatory and immune responses, specifically splicing control of gene expression after inflammatory stimuli.[59] In 2013 they discovered that ordered expression of genes following an inflammatory stimulus was controlled by splicing, not transcription as previously supposed.[63] This led to further discoveries that delayed splicing was caused by introns, with the revelation that RNA-binding protein BUD13 acts at this intron to increase the amount of successful splicing (2 articles by Luke Frankiw published in 2019 and 2020).[64] [65]

In an autobiographical piece published in Annual Review Immunology in 2019, Baltimore announced that half of his lab space at Caltech would be taken over by a new assistant professor in Fall 2018, and his current lab group would be the last. "I have been involved in research for 60 years, and I think it is time to leave the field to younger people." [12]

Public policy[edit]

In the span of his career, Baltimore has profoundly impacted national science policy debates, including the AIDS epidemic and recombinant DNA research.[59] [66] His efforts to organize the Asilomar Conference on Recombinant DNA were key to creating consensus within scientific and policy spheres.

In recent years Baltimore has joined with other scientists to call for a worldwide moratorium on use of a new genome-editing technique to alter inheritable human DNA.[67] A key step enabling researchers to slice up any DNA sequence they choose was developed by Emmanuelle Charpentier, then at Umea University in Sweden, and Jennifer A. Doudna of the University of California, Berkeley.[68] Reminiscent of the Asilomar conference on recombinant DNA in 1975, those involved want both scientists and the public to be more aware of the ethical issues and risks involved with new techniques for genome modification.[67]

An early spokesperson for federal funding for AIDS research, Baltimore co-chaired the 1986 National Academy of Sciences committee on a National Strategy for AIDS.[59] In 1986, he and Sheldon M. Wolff were invited by the National Academy of Sciences and the Institute of Medicine to coauthor an independent report: Confronting AIDS (1986), in which they called for a $1 billion research program for HIV/AIDS.[5][69] As of 1996 he was appointed head of the National Institutes of Health (NIH) AIDS Vaccine Research Committee (AVRC).[70]

Biotechnology[edit]

Baltimore holds nearly 100 different biotechnology patents in the US and Europe, and has been preeminent in American biotechnology since the 1970s. In addition to Calimmune and Immune Design, he also helped found s2A Molecular, Inc.[59] He has consulted at various companies including Collaborative Research, Brisol-Myers Squibb, and most recently Virtualitics. He serves on the Board of Directors at several companies and non-profit institutions including Regulus Therapeutics and Appia Bio. He has also been a member of numerous Scientific Advisory Boards, and currently serves with PACT Pharma, Volastra Therapeutics, Vir Biotechnology, and the Center for Infectious Diseases Research at Westlake University. He is the principal scientific advisor for the Science Philanthropy Alliance.

Awards and legacy[edit]

Baltimore's honors include the 1970 Gustave Stern Award in Virology, 1971 Eli Lilly and C. Award in Microbiology and Immunology, 1999 National Medal of Science, and 2000 Warren Alpert Foundation Prize.[71] He was elected to the National Academy of Sciences USA (NAS) in1974;[72] the American Academy of Arts and Sciences, 1974; the NAS Institute of Medicine (IOM), 1974;[73] the American Association of Immunologists, 1984.[74] He was elected a Foreign Member of the Royal Society (ForMemRS) in 1987;[75][76] the French Academy of Sciences, 2000;[77] and the American Association for Cancer Research (AACR).[73] He is also a member of the Pontifical Academy of Sciences, 1978.[78] In 2006 Baltimore was elected to a three-year term as president of the American Association for the Advancement of Science (AAAS).[73]

He has published over 700 peer-reviewed articles.[71][79]

Baltimore is a member of the USA Science and Engineering Festival's Advisory Board[80] and an Xconomist (an editorial advisor for the tech news and media company, Xconomy).[81] Baltimore also serves on The Jackson Laboratory's board of trustees,[82] the Bulletin of the Atomic Scientists' Board of Sponsors,[83] Amgen, Inc.'s board of directors,[84] and numerous other organizations and their boards.

In 2019 Caltech named a graduate fellowship program in biochemistry and molecular biophysics in honor of Baltimore. The program combined a $7.5 million gift from the Amgen Foundation with an existing one-year Amgen fellowship and $3.75 million given by Caltech's Gordon and Betty Moore Graduate Fellowship Match.[85]

Controversies[edit]

Imanishi-Kari case[edit]

Main article: Thereza Imanishi-Kari

During the late 1980s and early 1990s, Thereza Imanishi-Kari, a scientist who was not in Baltimore's laboratory but in a separate, independent laboratory at MIT, was implicated in a case of scientific fraud. The case received extensive news coverage and a Congressional investigation. The case was linked to Baltimore's name because of his scientific collaboration with and later his strong defense of Imanishi-Kari against accusations of fraud.

In 1986, while a professor of biology at MIT and director at Whitehead, Baltimore co-authored a scientific paper on immunology with Thereza Imanishi-Kari (an assistant professor of biology who had her own laboratory at MIT) as well as four others.[86] A postdoctoral fellow in Imanishi-Kari's laboratory, Margot O'Toole, who was not an author, reported concerns about the paper, ultimately accusing Imanishi-Kari of fabricating data in a cover-up. Baltimore, however, refused to retract the paper.

O'Toole soon dropped her challenge, but the NIH, which had funded the contested paper's research, began investigating, at the insistence of Walter W. Stewart, a self-appointed fraud buster, and Ned Feder, his lab head at the NIH.[87] Representative John Dingell (D-MI) also aggressively pursued it, eventually calling in U.S. Secret Service (USSS; U.S. Treasury) document examiners.[88]

Around October 1989, when Baltimore was appointed president of Rockefeller University, around a third of the faculty opposed his appointment because of concerns about his behaviour in the Imanishi-Kari case. He visited every laboratory, one by one, to hear those concerns directly from each group of researchers.[87]

In a draft report dated March 14, 1991 and based mainly on USSS forensics findings, NIH's fraud unit, then called the Office of Scientific Integrity (OSI), accused Imanishi-Kari of falsifying and fabricating data. It also criticized Baltimore for failing to embrace O'Toole's challenge.[citation needed] Less than a week later, the report was leaked to the press.[89] Baltimore and three co-authors then retracted the paper; however, Imanishi-Kari and Moema H. Reis did not sign the retraction.[90] In the report, Baltimore stated that he may have been "too willing to accept" Imanishi-Kari's explanations, and felt he "did too little to seek an independent verification of her data and conclusions."[91] Baltimore publicly apologized for not taking a whistle-blower's charge more seriously.[92]

Amid concerns raised by negative publicity in connection with the scandal, Baltimore resigned as president of Rockefeller University[93] and rejoined the MIT Biology faculty.[94]

In July 1992, the US Attorney for the District of Maryland, who had been investigating the case, announced he would bring neither criminal nor civil charges against Imanishi-Kari.[95][96] In October 1994, however, OSI's successor, the Office of Research Integrity (ORI; HHS) found Imanishi-Kari guilty on 19 counts of research misconduct, basing its conclusions largely on Secret Service analysis of laboratory notebooks, documents that these investigators had little experience or expert guidance in interpreting.[97]

An HHS appeals panel began meeting in June 1995 to review all charges in detail. In June 1996, the panel ruled that the ORI had failed to prove even one of its 19 charges. After throwing out much of the documentary evidence gathered by the ORI, the panel dismissed all charges against Imanishi-Kari. As their

its 19 charges. After throwing out much of the documentary evidence gathered by the ORI, the panel dismissed all charges against Imanishi-Kari. As their final report stated, the HHS panel "found that much of what ORI presented was irrelevant, had limited probative value, was internally inconsistent, lacked reliability or foundation, was not credible or not corroborated, or was based on unwarranted assumptions." It did conclude that "The Cell paper as a whole is rife with errors of all sorts ... [including] some which, despite all these years and layers of review, have never previously been pointed out or corrected. Responsibility ... must be shared by all participants." Neither OSI nor ORI ever accused Baltimore of research misconduct.[98][99] The reputations of Stewart and Feder, who had pushed for the investigation, were badly damaged.[99] The pair were reassigned to other positions at NIH because they failed to maintain productivity in their roles as scientists and questions were raised about the legitimacy of their self-appointed inquiries into scientific integrity.[100]

The Imanishi-Kari controversy was one among several prominent scientific integrity cases of the 1980's and 1990's in the United States. In nearly all cases, defendants were ultimately cleared.[97] The case profoundly impacted the process for handling of scientific misconduct in the United States.[97] Baltimore has been both defended and criticized for his actions in this matter.[101][27][102][103][104][66][105] In 1993, Yale University mathematician Serge Lang strongly criticized Baltimore's behavior.[106] Historian of science Daniel Kevles, writing after the exoneration of Imanishi-Kari, recounted the affair in his 1998 book, The Baltimore Case.[107][108] Horace Freeland Judson also gives a critical assessment of Baltimore's actions in The Great Betrayal: Fraud In Science.[109] Baltimore has also written his own analysis.[110]

Luk van Parijs case[edit]

In 2015, at Baltimore's request, Caltech began investigating the work that Luk van Parijs had conducted while a postdoc in Baltimore's laboratory.[111] Van Parijs first came under suspicion at MIT, for work done after he had left Baltimore's lab. After van Parijs had been fired by MIT, his doctoral supervisor also noted problems with work van Parijs did at the Brigham and Women's Hospital, before leaving Harvard to go to Baltimore's lab.[112] The Caltech investigation concluded in March 2007. It found van Parijs alone committed research misconduct, and that four papers co-authored by Baltimore, van Parijs, and others required correction.[113]

Awards and honors[edit]

- First recipient of the Gustav Stern Award in Virology (1971)
- Warren Triennial Prize (1971)
- Eli Lilly Award in Immunology and Microbiology (1971)
- Fellow of the American Academy of Arts and Sciences (1974)
- NAS Award in Molecular Biology (1974)
- Canada Gairdner International Award (1974)[114]
- Nobel Prize in Physiology or Medicine (1975)
- EMBO Member (1983)[4]
- Golden Plate Award of the American Academy of Achievement (1986)[115]
- National Medal of Science (1999)
- Warren Alpert Foundation Prize (2000)

Honorary degrees[edit]

- 1976 Swarthmore College, Swarthmore, PA[16]
- 1987 Mount Holyoke College, So. Hadley, MA[16]
- 1990 Mount Sinai Medical Center, New York, NY[16]
- 1990 Bard College, Annandale-on-Hudson, NY[16]
- 1990 University of Helsinki, Helsinki, Finland[16]
- 1998 Weizmann Institute of Science, Israel[16]
- 1999 Cold Spring Harbor Laboratory, Cold Spring Harbor, NY[16]
- 1999 University of Alabama, Birmingham, AL[16]
- 2001 California Polytechnic State University, San Luis Obispo, CA[16]
- 2004 Columbia University, New York, NY[116]
- 2004 Yale University, New Haven, CT[117]
- 2004 The Rockefeller University, New York, NY[118]
- 2005 Harvard University, Cambridge, MA[119]
- 2012 University of Buenos Aires, Buenos Aires, Argentina[120]

Personal life[edit]

Baltimore was married in 1968 to Dr. Alice S. Huang. They have one daughter.[121] He is an avid fly-fisherman.[27]

Books[edit]

Luria, S. E., J.E. Darnell, D. Baltimore and A. Campbell (1978) General Virology 3rd edition John Wiley and Sons, New York, New York.[122]

Darnell, J., H. Lodish and D. Baltimore (1986) Molecular Cell Biology, Scientific American, New York, New York.[123]

Baltimore and the opium trade with China

Research paper from Columbia University

See [HE001P][GDrive]

"1805 : Baltimore ship, *Entan*, carries opium to Canton "

It was February, 1784. Only five months earlier, the U.S. and Great Britain signed the Treaty of Paris (September 3, 1783). This agreement ended the Revolutionary War. U.S. ships could no longer trade with the British West Indies. Trade with other nations was in a slump. Americans especially missed tea. Robert Morris (1734-1806), a banker, decided to find a way to supply that tea. By doing so, he said, he hoped "to encourage others in the adventurous pursuit of commerce."

Empress of China

Morris hired a small ship and renamed it the *Empress of China*. The ship was set to sail east, around the southern tip of Africa, to Canton (Guangzhou), China. It would return by the same route. The ship's captain, John Green, had spent the war attacking British cargo ships. His crew of 34 men included a gunner, who would come in handy if the ship met pirates. Also aboard were two carpenters, a barrel-maker, and several boys. The boys were beginning their careers in the merchant marine.

In some ways, the most important man aboard was the "supercargo," Samuel Shaw of Boston. Shaw was a businessman, in charge of the $120,000 cargo in the ship's hold. The *Empress* carried lead, 2,600 animal skins, fine camel cloth, cotton, and a few barrels of pepper. It also carried 30 tons of ginseng, a root that grew wild in North America. The Chinese valued ginseng for its healing powers.

Trading in Canton

The *Empress* left New York harbor on February 22, 1784. Six months later, in August, it arrived at Macao, a Portuguese outpost on the Chinese coast. Here, Captain Green hired Chinese pilots to guide his ship up the Pearl River to Whampoa. Trading ships stayed in Whampoa while their supercargoes worked out deals in Canton, 12 miles upstream.

The Chinese wanted as few foreigners as possible in their country. They believed that China was the center of a square earth. Foreigners, they felt, had nothing but trouble to offer China. The Chinese called the Americans the "New People." But Americans were lumped with all outsiders as "Foreign Devils."

Samuel Shaw spent the next fourth months in Canton. Foreigners there weren't free to roam. The Chinese ordered them to stay in compounds call *hongs* [see Macartney and the Emperor for more about *hongs*]. *Hongs* were pleasant places, where Chinese merchants called to trade.

Shaw traded his cargo for tea, nankeen (Chinese cotton), tableware, silk, and spice. The shipment was welcomed in the U.S. when the *Empress* returned there in May, 1785. The Chinese goods brought Robert Morris and his partners $30,000 — an impressive profit.

Other U.S. merchants were quick to see the value of the China trade. At first, however, they flooded the Chinese market with ginseng. Chinese demand for the root dropped, and so did its price. But the Chinese did want sea-otter pelts, which Yankees traded from Indians in the American Northwest. Sandalwood, found in the Sandwich Islands (Hawaii), also brought a high price from Chinese merchants.

From Ginseng to Opium

The trade took an ugly turn in the early 1800s. British merchants began carrying opium to China, and many Americans followed suit. Opium, a drug, created its own demand by making addicts of its users. U.S. merchants found they could buy a pound of opium in Turkey for $2.50 and sell it in Canton for $10.00.

A Chinese attempt to shut down the opium traffic led to war with Britain. The "Opium War" lasted two years. It ended with a treaty that punished China and opened four more ports to British shipping. In later treaties, China granted the U.S. and France the same privileges Britain had.

Turmoil within China would interrupt trade with the U.S. during the next 100 years. Then, in 1949, a Communist government took over in China. The next year, Chinese and U.S. troops faced off in Korea, and the China trade ended for 22 years.

Now, commerce between China and the U.S. is picking up again. Trade has brought the two nations closer, just as it did in 1784.

See Canton, Baltimore, Maryland .

Baltimore port/neighborhood of Canton -

"In 1785, Irish merchant John O'Donnell settled in Baltimore and began trading with merchants in the Chinese port of Guangzhou, then called Canton by English speakers. When O'Donnell purchased land, he named his plantation Canton.[4] In the Late 18th century, O'Donnell's land was sold off by his son Columbus O'Donnell, William Patterson and Peter Cooper, and was developed for waterfront industry and blue-collar housing.[5]"

See [HX000L][GDrive]

I opened the worn and weathered logbook and was transported back to an exhilarating era of faraway lands, secret trade, and international incidents. From the first page, I was hooked. In my first weeks as an intern at the National Museum of American History, my supervisor, Maritime Curator Paul Johnston, asked me to research the logbook of the brig Ea, a vessel suspected of involvement in the opium trade. A brig is square rigged ship with two masts; the Ea was built in Baltimore, Maryland, circa 1815 as a merchant vessel during one of America's busiest trading eras. Doctor Johnston accessioned the logbook because the Ea was a local ship, and believed it would serve as a good representation of commerce at the time. The name of this vessel, Ea, is unusual—we can only surmise the two letters are the initials of an owner's loved one. The ship's logbook began on February 24, 1821, when the ship departed from Baltimore on a trading voyage to Canton, China. According to the log keeper, William Sanford, the ship reached Canton in August 1821, and left again on November 28, 1821, heading for Amsterdam. ***By 1793, the British East India Co. had a monopoly on the opium trade from India to China****; around this time the number of Chinese and British who recreationally smoked opium reached an all time high (no pun intended). The Chinese Emperor banned opium in 1799, making trade illegal.* ***In the early 1800s, though, American traders realized the high profits involved and began to smuggle opium from Turkey into China. The commodity passed primarily through the complicated port of Canton, where it was bought by shady merchants on islands in the bay. Perkins & Company of Boston, Massachusetts, was a major American trading company with a firm in Canton; in fact, the company would use rice cargoes to cover up opium transactions.*** *John Perkins Cushing recorded the arrival and departure of trading ships, including the Ea. After much searching to determine if the Ea participated in opium trading, I found a single sentence in an obscure book, citing Perkins & Company records:* ***"...The Ea, Captain Alexander Clark, [arrived] with between 140 and 160 piculs of the drug [opium]." A picul is an ancient Asian standard of weight and is approximately 133.3 lbs.; thus the Ea was smuggling an astonishing 20,000 pounds of opium!*** *Digging deeper, I found a report of the United States Secretary of State regarding an international issue involving the Ea and Captain Clark. On September 25, 1821, while the Ea was anchored at Canton, an Italian crewman on board another American merchant vessel was accused of killing a Chinese woman. Captain Clark signed as witness of the event, with multiple other ship captains. Political relations between China and the U.S. tensed as the Chinese wanted to execute the Italian sailor and the U.S. stalled for a fair trial. Unfortunately, the Italian was executed. I did not find out any other information about this incident; it was not mentioned in the logbook nor was there mention of any repercussions for Captain Clark. Many more hours could be spent unraveling the complicated mystery of the Ea. The opium trade was an early example of international drug smuggling and exemplifies the repercussions of a quick profit fueled by addiction. Researching the Ea sparked my fascination for the dark undercurrents of this chapter in American history. There is something fascinating about the stories preserved in a ship's battered logbook, and something enticing about a smuggling brig setting sail for the far ports of Canton.*

Daniel Richard Bannister (born 1930)

Worked at :

- Dynalectron Corporation / DynCorp International

Associations

- Bernie Edward Zettl (born 1922) (DynaElectron / DynCorp)

2011 (March 15) - Washington Post - Daniel Richard Bannister was born June 29, 1930, in Detroit.

[HN01CZ][GDrive]

Daniel R. Bannister former president of DynCorp, dies at 80 / By **T. Rees Shapiro**

Daniel R. Bannister, 80, who as president and chief of executive of DynCorp from 1985 to 1997 led the government contracting firm through tremendous growth, died March 12 at Georgetown University Hospital. He had pancreatic cancer.

Mr. Bannister was paid $1.65 an hour when he joined DynCorp as an electronics technician in 1953. A half-century later, when DynCorp was sold to Computer Sciences Corp., Mr. Bannister had become the company's chairman and one of its largest individual shareholders, owning 4.1 percent of the business.

During his tenure, Mr. Bannister oversaw the acquisition of more than 40 companies. When he retired in 2003, he was credited with helping to mold what had been an aviation services company into a sprawling conglomerate that employed 24,000 people and earned $2.4 billion in annual revenue.

Much of the company's business stemmed from a variety of government contracts. Under Mr. Bannister's stewardship, DynCorp employees mowed government lawns, maintained military aircraft and built federal computer networks.

He oversaw DynCorp contracts to operate missile test ranges for the Defense Department, develop vaccines for the National Institutes of Health and install security systems in U.S. embassies for the State Department.

As a private security contractor, DynCorp supplied bodyguards to Haitian President Jean-Bertrand Aristide in the 1990s and to Afghan President Hamid Karzai during the early 2000s.

In 1992, by highlighting his company's technical advances on computerized operations, Mr. Bannister helped DynCorp win a lucrative contract to operate and manage the U.S. Strategic Petroleum Reserve.

Mr. Bannister, a longtime McLean resident, stepped down as DynCorp's president and chief executive in 1997 to become chairman of the board.

Seven years after he left the company, DynCorp was sold to private-equity firm Cerberus Capital Management in 2010.

Daniel Richard Bannister was born June 29, 1930, in Detroit. When he was 11, his father died and Mr. Bannister was compelled to take a leading role in his family's welfare.

He enlisted in the Air Force in 1948 and was trained as a radar technician. After service in the Korean War, Mr. Bannister left the military in 1952 and a year later joined Eastern Airways, a precursor of DynCorp.

DynCorp was a publicly traded company for many years until 1988, when Mr. Bannister led a group of investors to take the company private in order to fend off a hostile takeover attempt.

After the buyout, Mr. Bannister began to expand DynCorp's interests in telecommunications and technology.

His marriages to Sheila Thompson and Paula DeCoutis ended in divorce.

Survivors include his wife of four years, Sondra Fearnsides Bannister of McLean, Va.; three children from his first marriage, Michael Bannister of Wimberley, Tex., Linda Epstein of Estero, Fla., and Vickie Pasterak of San Diego; a sister; and four grandchildren.

In 1996, Mr. Bannister was supposed to accompany Commerce Secretary Ronald H. Brown on a visit to Eastern Europe, where DynCorp had contracts to repair infrastructure destroyed during the Bosnian War.

Two days before the trip, Mr. Bannister decided not to go because of scheduling conflicts.

On April 3, the plane that he would have been on crashed into a mountain in Croatia, killing the commerce secretary and 34 others. When Mr. Bannister learned of the accident, he still had the trip's itinerary in his suit pocket.

"I'm lucky, I'm grateful, and I'm humbled," Mr. Bannister told The Washington Post in 1996. "The good Lord spared me for a purpose. Now, I've got to figure out what that purpose is."

From that point forward, his family said, Mr. Bannister intensified his focus on philanthropy. He made significant contributions of his time and money to Easter Seals, Joe Gibbs's Youth for Tomorrow and a number of other charities in the Washington area.

FORT WORTH STAR-TELEGRAM Sunday, November 10, 1963 Section Five PAGE THREE

BUSINESS AT WORK

Fort Worth Firm Wins Coffee Supply Contract

Kimbell Coffee and Tea Corporation of Fort Worth has been awarded a $147,071 contract for roasted ground coffee by the New York regional headquarters of the Defense Subsistence Supply Center which buys food supplies for the armed services.

Twelve firms competed for the contract.

A 10-year award pin was presented to **DAN R. BANNISTER**, vice president and manager of Dynalectron Aerospace Operations Division here.

Bannister, 33, of 4100 Galt, is one of the youngest aviation executives in the nation. A gold pen and pencil set were given to Bannister by **BERNIE ZETTL**, director of program planning. Also participating in the ceremony were **JACK VESTAL**, operations manager, and **JACK MIKEL**, personnel manager.

An extensive microwave system following the course of the Nile River from Cairo to Aswan will be built by Collins Radio which has a division in Dallas.

The 500-mile communication link will make television available for the first time to most Egyptian people.

JOSEPH P. POWELL has been named Houston manager of Mars Instrument Company.

The appointment of **EDWARD L. SKINNER** as sales representative for Texas and Louisiana was announced by **GORDON L. BROTT**, manager of the Fort Smith, Ark., plant of Ohio Rubber Company.

Skinner, a Dallas resident, is the former president of Renniks Rubber Company in Fort Worth.

HAL CARPENTER of Dallas has been named to supervise North Texas sales of the first rolled carpet goods to be produced in the mid-continent area.

Sequoyah Mills announced that Carpenter will be territory manager for the Fort Worth-Dallas metropolitan area.

Clary Corporation Vice President **EDSON I. SMALL** has announced the formation of a new marketing position and a man to fill the spot.

WILLIAM F. DORITY will fill the position of field sales manager, with his headquarters in Montclair, N. J.

A registered secondary offering of 350,000 shares of the Mosler Safe Company common stock ($1 par value) has been announced by Blyth & Company, Inc. and associates.

The shares are being sold for the account of three members of the Mosler family who will hold some 57 per cent of the common stock after the sale. None of the proceeds of the sale will accrue to the company. Subject to obtaining board distribution of its common stock to meet requirements of the New York Stock Exchange, the Mosler firm intends to apply for listing on the exchange.

SAM REZINKOFF of 5400 Odessa has been elected to the Agents Advisory Council for the Southwestern region of the New York Life Insurance Company.

A marketing, research and business planning specialist, **ROBERT W. CLARK**, of Fort Worth has been appointed assistant to the president of the Western Company.

Clark has been associated with GE since 1947 and is former manager of the aviation and defense systems for the firm's outdoor lighting department in Hendersonville, N. C.

A new addition to the staff of Superior accounting, Tax & Insurance Service at 2850-A W. Berry, is **ROY TUGGLE**.

MICKEY GOLDMAN, Fort Worth business man, was one of the principals at a state meeting for Calvert Distillers Company in Dallas recently when executives of the firm came to Texas to launch Calvert Extra.

The appointment of **GORDON H. FISHER** of Gainsville as assistant to the president was announced by **FRANK R. MILLIKEN**, president of Kennecotte Copper Corporation. Fisher was president of General Minerals in Houston before joining Kennecotte.

ELBERT J. HALING, assistant to the regional director of Public Housing Administration in Fort Worth discussed "Better Public Relations for Better City Government" at the Arkansas Municipal League Convention at Hot Springs Friday.

FLOYD E. BLOUNT, Socony Mobil Oil Company of Dallas, will address the North Texas (Fort Worth-Dallas) section of the National Association of Corrosion Engineers Monday at the Torch Restaurant in Dallas at 8:30 p. m.

MICKEY GOLDMAN

ROY TUGGLE

SAM REZINKOFF

JOHN L. HANIGAN

JOSEPH P. POWELL

EDWARD T. SKINNER

C. H. ANSEL

DAN BANNISTER

Three University of Texas professors have collaborated on a Textbook, "Intermediate Accounting," a new publication. The authors are **DR. JOHN WHITE, DR. GLENN A. WALSH** and **DR. CHARLES T. ZLATKOVICH.**

Preparations are underway at Aluminum Company of America's Rockdale, Texas, plant to restart a 25,000-ton potline, thus boosting the smelter's production to 100 per cent capacity and its work force to more than 1,000 men.

JOHN L. HANIGAN has been named president of Brunswick Corporation.

He will assume his new duties as soon as he can be relieved of his old ones.

The appointment of **C. H. ANSEL JR.** as technical representative for Haveg Reinhold Inc., Santa Fe Spcings, Cal., has been announced.

TOM F. ANDERSON of Alcoa has been elected president of Texas Chemcial Council, an association of more than 50 chemical firms with operations in Texas.

Hayes Employment Service has announced the complete remodeling and expansion of their offices in the Continental Life Building.

Promotion of **B. B. McCULLOUGH** from agent to assistant manager of Fort Worth District No. 1 of the American National Insurance Company of Galveston has been announced by **W. W. CHERRY**, senior vice president and director of combination agencies.

Frank Stringfellow Barr (born 1897)

1982-02-05-nytimes-stringfellow-barr-educator-dies-clip-profile.jpg /

https://en.wikipedia.org/wiki/Stringfellow_Barr

1982-02-05-nytimes-stringfellow-barr-educator-dies.pdf /

Stringfellow Barr, a prominent author and educator who, as president of St. John's College in Annapolis, Md., introduced a radically new curriculum composed entirely of the study of 100 great books of man's past, died Tuesday night of pneumonia at a nursing home in Alexandria, Va. He was 84 years old.

On assuming the presidency of the college in 1937, Professor Barr announced that its conventional curriculum would be scrapped in favor of a mandatory, uniform, four-year program modeled on courses taught at Columbia University and the University of Chicago.

"The hundred best books of European thought in all fields will provide the college's new means of instruction," Professor Barr said at the time.

He distinguished the program from its predecessors as follows: "At St. John's, the program is not one of many courses; it is the entire curriculum."

"Moreover," he said, "where the Columbia and Chicago book lists leaned overwhelmingly toward the humanities, the St. John's freshmen read their Euclid, their Nicomachus, their Archimedes along with their Homer." Program Evokes Criticism

Professor Barr acknowledged after the first year that some critics had found the program "authoritarian and fascist, because the student is not allowed to choose what he will study and what he will ignore."

On the other hand, he observed, "For the first time in possibly 1,500 years, a group of college freshmen has just read Euclid's 'Elements' through."

"Meanwhile," Professor Barr said, "Catholic educators have denounced the list for including Marx and Freud along with St. Augustine and St. Thomas. Yet surely both St. Thomas and Freud are part of the intellectual tradition of the Occident."

Others included in the list, which had grown to 109 books by the time Professor Barr left St. John's in 1946, were Chaucer, Copernicus, Dante, Darwin, Dickens, Goethe, Hume, Ibsen, James, Kant, Locke, Milton, Rabelais, Shakespeare, Tolstoy and Virgil. The Old and New Testaments were also studied.

The regimen he and Dean Scott Buchanan established has been maintained to this day. Carl F. Hovde, dean of Columbia College from 1968 until 1972, a time when it was under pressure to revise its own relatively stringent curriculum, said last night of St. John's, "It has always been exciting to have a place with so clear a sense of what it wishedto do and which never made compromises." "St. John' s view," Dr. Hovde said, "was to recover the traditionof the West i n a more thoroughgoing way than any other institution inAmerica tried to do."

Professor Barr, who was known to his family, friends and colleagues as Winkie, was born in Suffolk, Va. He earned degrees at Oxford University, where he was a Rhodes Scholar, the University of Virginia and the University of Paris.

Professor Barr taught at the University of Virginia from 1924 to 1937 and was also a visiting professor at the University of Chicago. Warns of Global Atom Warfare

Among those urging creation of a world union after World War II, Professor Barr cautioned in September 1945: "To trust any league, alliance, association or treaty among sovereign nations to outlaw the production or use of atomic bombs is to trust swamps to cease producing mosquitoes." He was the president of the Foundation for World Government from 1948 until 1958.

Professor Barr also taught at the Newark College of Arts and Sciences of Rutgers University from 1955 to 1964. He was the author of 11 books, including histories of Europe and Greece, a cookbook, a children's book and a novel, "Purely Academic," which was described by The Times's reviewer as an "acid critique of college life."

In his last public role, Professor Barr was a fellow at the Center for the Study of Democratic Institutions in Santa Barbara, Calif., from 1966 to 1969.

During the campus disorders of the late 1960's, Professor Barr praised college administrators who had dealt with students thoughtfully, instead of dismissing them as "truculent petitioners."

"Such administrators," he said at the center in May 1969, "have by their behavior suggested how much more exciting a college or university can be than a fortress or a guerrilla camp."

Upon leaving the center, Professor Barr and his wife, Gladys Baldwin Barr, whom he married in 1921, moved to Kingston, N.J. Mrs. Barr died in 1974. Professor Barr had been confined to a nursing home since May 1979.

The couple had no children. Professor Barr is survived by a nephew, William Alexander Barr of Gibson Island, Md., and a cousin, Sarah Patton Boyle of Arlington, Va.

St. John's College is planning a memorial service.

https://en.wikipedia.org/wiki/Stringfellow_Barr

2019-12-12-wikipedia-stringfellow-barr.pdf /

Stringfellow Barr (January 15, 1897, in Suffolk, Virginia – February 3, 1982, in Alexandria, Virginia) was a historian, author, and former president of St. John's College in Annapolis, Maryland, where he, together with Scott Buchanan, instituted the Great Books curriculum.

Career[edit]

Barr was the editor of *Virginia Quarterly Review* from 1931–1937.[1] He established and was president of the Foundation for World Government from 1948 to 1958. In the 1950s he taught classics at Rutgers University.

Barr wrote compact yet lucid historical surveys of three major periods of western history. Two of his books, *The Will of Zeus* and *The Mask of Jove* deal with the Greeks and Romans, respectively. He also wrote *The Pilgrimage of Western Man*, dealing with western history from the Renaissance through the early post-World War II era.[2]

His nickname was "Winkie" [1].

In a 1951 *New York Post* column, Arthur Schlesinger Jr. mocked Barr as belonging to the "solve-the-Russian-problem-by-giving-them-money school," and said, of him and two others, "None of these gentlemen is a Communist, but none of them objects very much to Communism. They are the Typhoid Marys of the left, bearing the germs of the infection even if not suffering obviously from the disease."[2]

Barr's views on the poor quality of American education and an American society driven by consumerist ideology are presented in ironic terms in *Purely Academic* (1958), a classic academic novel set in an anonymous Corn Belt university during the McCarthy period, as when a character in the story says that

Many observers here and abroad note a kind of higher illiteracy in our college graduates. But we like it that way. In our cars we like horsepower; in our studies we like slow-motion and low-gear. In education the intellectually second-rate does not shock us. To insist on the first-rate would be arrogant. Anyhow, if we are so second-rate, how come we are the richest nation in recorded history and the fattest people on earth? [3]

In 1959, Barr was one of a number of signatories to a petition asking the U. S. Congress to abolish the House Committee on Unamerican Activities. Other notable signatories included Eleanor Roosevelt and Reinhold Niebuhr.

Barr wrote *The Kitchen Garden Book* (New York: Viking Press, 1956) with Stella Standard. The *Kitchen Garden* is a manual on growing and cooking common vegetables.

New York Times reviewer Edmund Fuller called his 1958 novel, *Purely Academic*, "bitterly hilarious," "sadistically satirical," and "funny and appalling." [3]

Simon Barr in the "Peithologian Society"

Tweet that discovered this is [HT0034][GDrive] .

What is the Peithologian Society ?

*"The **Peithologian Society** was an undergraduate debate society at Columbia University. It was founded in 1806, four years after Columbia's first literary society, the **Philolexian Society** , by freshmen who were disenfranchised by Philolexian's requirement that its members be upperclassmen. Its emphasis on debate, composition, and rhetoric was similar to Philo's literary aims, and the two societies shared other superficial characteristics as well. Philo adopted light blue as its official color, while Peithologian adopted white (Columbia later appropriated the two hues as its own official school colors). Whereas Philolexian's symbol was a rising sun, Peithologian's was a star. Its Latin motto was "Vitam Impendere Vero" meaning, roughly, "To devote one's life to truth." "*

What is the Philolexian Society ?

*"The **Philolexian Society** of Columbia University is one of the oldest college literary and debate societies in the United States, and the oldest student group at Columbia. Founded in 1802, the Society aims to "improve its members in Oratory, Composition and Forensic Discussion." The name Philolexia is Greek for "love of discourse," and the society's motto is the Latin word Surgam, meaning "I shall rise." The society traces its roots to a literary society founded by Alexander Hamilton in the 1770s.*

*Philolexian (known to members as "Philo," pronounced with a long "i") has been called the "oldest thing at Columbia except the College itself," and it has been an integral part of Columbia from the beginning, providing the institution with everything from its colors, Philolexian Blue (along with White, from her long-dispatched rival **Peithologian Society**), to some of its most solemn traditions and many of its most noted graduates. Members are admitted after a highly selective evaluation process and are sworn to secrecy thereafter. "*

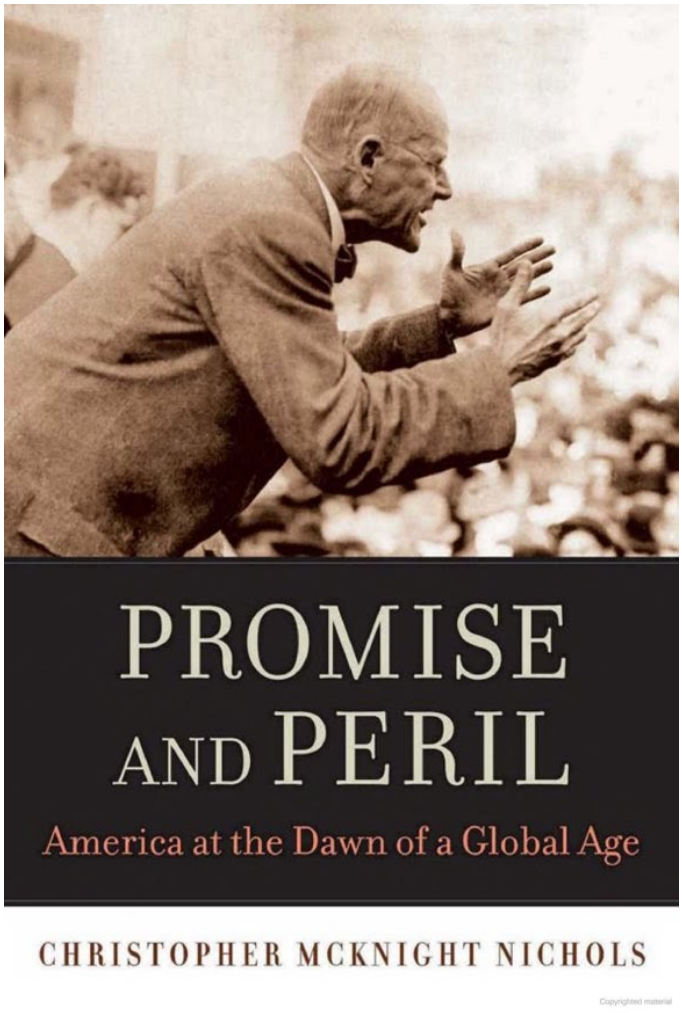
1911 - 1913 (est) - College roommate was Randolph Bourne

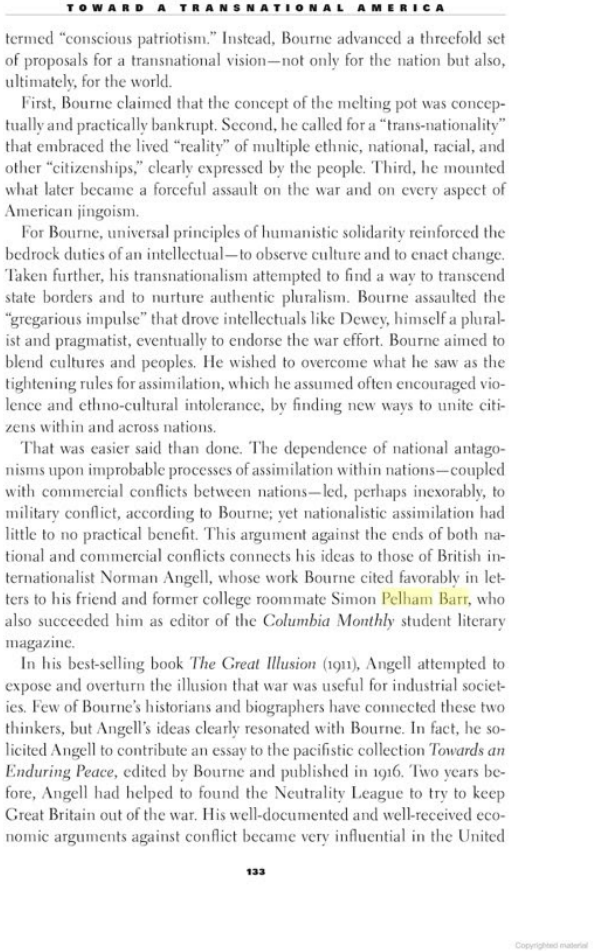
🔵**Randolph Bourne** is *"a progressive writer and intellectual born in Bloomfield, New Jersey, and a graduate of Columbia University. Bourne is best known for his essays, especially his unfinished work "The State," discovered after he died."* Also went to Columbia.

Referred to in page 133 of **Promise and Peril : America at the Dawn of the Global Age** " (written by **Christopher McKnight Nichols**). Google book can be purchased at [HB0010] .

*"This was easier said than done. The dependence of national antagonisms upon improbable process of assimilation within nations - couples with commercial conflicts between nations - led, perhaps inexorably, to military conflict, according to [🔵**Randolph Bourne**] ; yet nationalistic assimilation had little to no practical benefit. This argument against the ends of both national and commercial conflicts connects his ideas to those of British Internationalist **Normal Angell**, whose work Bourne cited favorably in letters to his friends and former college roommate **Simon Pelham Barr**, who also succeeded him as editor of the Columbia Monthly student literary magazine."*



[HB0012][GDrive]



TOWARD A TRANSNATIONAL AMERICA

termed "conscious patriotism." Instead, Bourne advanced a threefold set of proposals for a transnational vision—not only for the nation but also, ultimately, for the world.

First, Bourne claimed that the concept of the melting pot was conceptually and practically bankrupt. Second, he called for a "trans-nationality" that embraced the lived "reality" of multiple ethnic, national, racial, and other "citizenships," clearly expressed by the people. Third, he mounted what later became a forceful assault on the war and on every aspect of American jingoism.

For Bourne, universal principles of humanistic solidarity reinforced the bedrock duties of an intellectual—to observe culture and to enact change. Taken further, his transnationalism attempted to find a way to transcend state borders and to nurture authentic pluralism. Bourne assaulted the "gregarious impulse" that drove intellectuals like Dewey, himself a pluralist and pragmatist, eventually to endorse the war effort. Bourne aimed to blend cultures and peoples. He wished to overcome what he saw as the tightening rules for assimilation, which he assumed often encouraged violence and ethno-cultural intolerance, by finding new ways to unite citizens within and across nations.

That was easier said than done. The dependence of national antagonisms upon improbable processes of assimilation within nations—coupled with commercial conflicts between nations—led, perhaps inexorably, to military conflict, according to Bourne; yet nationalistic assimilation had little to no practical benefit. This argument against the ends of both national and commercial conflicts connects his ideas to those of British internationalist Norman Angell, whose work Bourne cited favorably in letters to his friend and former college roommate Simon Pelham Barr, who also succeeded him as editor of the *Columbia Monthly* student literary magazine.

In his best-selling book *The Great Illusion* (1911), Angell attempted to expose and overturn the illusion that war was useful for industrial societies. Few of Bourne's historians and biographers have connected these two thinkers, but Angell's ideas clearly resonated with Bourne. In fact, he solicited Angell to contribute an essay to the pacifistic collection *Towards an Enduring Peace*, edited by Bourne and published in 1916. Two years before, Angell had helped to found the Neutrality League to try to keep Great Britain out of the war. His well-documented and well-received economic arguments against conflict became very influential in the United

THE CITIES ARE DUMB.

The urgencies and forces of the war, with their governmental penetration into every phase of national existence, have given impetus to the effective organization of practically every agency, social, professional, industrial, commercial and economic. Whatever their purposes or are expressed and may be defended. The failure of the cities to organize for mutual benefit is unjustly depriving the people of protection of vital interests and may result in grave hazards.

The need of such an organization or of proper representation has been demonstrated time and again since the war began. The curtailment of public improvements through a multitude of regulations has been controlled by vacillating, vague and frequently incoherent policies and utterances. One reason is that the government officials concerned have been confronted with gigantic and urgent problems and the municipalities have not presented to them the proper necessary information and opinions to help them in solving these problems in the best way. If the cities have suffered unnecessarily thereby it is their own fault.

One of the most important situations facing the citizens at present is that of the public utilities which are demanding—and frequently receiving—higher rates and fares. Conditions have gone beyond the hands of state regulating commissions, before which, in normal times, the interests of the cities and their consumers would have been safeguarded. The utilities, the employes of the companies and the financial forces are more than effectively represented. Their cases are being presented with the utmost intelligence and insistence. But there is no spokesman for the consumers and the cities. At the recent hearing on street railway fares, only two or three cities immediately threatened sent representatives. It is the same with power rates, water power developments, financing and every other municipal concern.

The cities must be organized and represented—and quickly. The National Municipal League does not appear to be interested and the National Utilities Bureau has suspended operations at the crucial time. Since most of the problems arising involve public utilities of one kind or another, the American Society of Municipal Improvements, with the co-operation of the state leagues of municipalities and other special organizations of any strength, would seem to be the logical medium for securing this co-operation, and we urge it to act promptly. A working committee is needed at once. The cities

Contents of This Issue.

OUR COMBINED ISSUES.

In spite of efforts made during the past month to catch up with our publication schedule, which the printers' strike had interrupted, the printers have found it physically impossible to do so, the holiday season adding to the difficulty. We therefore decided that the only course possible was to combine issues, publishing each week as many pages as the printers could handle. The four December issues were accordingly combined in one published last week, to finish the volume; and in this issue are combined the first two of the new volume. We hope, following this number, to issue the paper regularly on the publication date.

HOW ABOUT THE 1920 IMPROVEMENTS?

From two months to two years are required for deciding upon and preparing a well-digested and satisfactory plan for any engineering work. At least one or two months are necessary for advertising and letting, and an equal time for the contractor to make his preparations for beginning work. And ground should be broken

A Disgraceful Financial Policy

The protest on page 15 against the continued delay on the part of the city of New York to keep its sacred pledge or to pay just debts long overdue, is put in strong language but none too strong. The stinging rebuke is well merited and ought to arouse enough public attention to compel the prompt settlement, at this late date, of the claims in question.

The facts are that at the entrance of the United State into the world war there were more than thirty important subway contracts under construction, most if not all of which had been very seriously delayed by the changed conditions brought about by the war, that had already resulted in a heavy increase of the cost of labor and materials to the contractors above those costs which prevailed when the contracts were awarded, and which could not at that time be foreseen. This necessarily involved heavy losses to the contractors who were prepared to accept them and who were faithfully performing their obligations notwithstanding the fact that in many cases they had suffered great additional hardship through unexpected changes and just claims have been paid by the city and there appears to be very slight inclination of the responsible officials to liquidate these claims.

In former years contractors with the highest reputation and long city records for honest, efficient, prompt work had great difficulty in collecting just bills from the city, and have been obliged to resort to slow and costly litigation, and have generally felt that in many cases the policy of the city is to throw the greatest possible responsibility on the contractor, regardless of the merits of the case, and to pay him as little as possible and as slowly as possible for the work regardless of the just compensation.

That such conditions can prevail in New York or any other American city is not only disgraceful but perilous in that, besides discouraging the efforts of loyal and efficient contractors, it encourages a most dangerous disregard of honest obligations that is little if any less mischievous than the deliberate violation of its contracts by labor.

Profitable Co-ordination of Practical and Theoretical Considerations in Waterworks Design

There is commenced in this issue a paper on the design of the Winnipeg Aqueduct which, properly interpreted, is remarkably illuminating in its presentation of the manner in which exceptionally satisfactory technically and financial results were obtained in the design and construction of a great water supply system.

To a very thorough preliminary investigation of the subject were added a keen analysis of conditions and a judicial equating of difficulties, advantages and requirements, which enabled the design to be made in such a way as to co-ordinate the possibilities of construction and operation. The result has been the eminently successful construction, during the worst of the war period, of a large and costly aqueduct and appurtenances practically within the originally estimated time and cost,

July 1920 - Simon Barr is No longer Assistant Editor - What job did he take ?

1918 - Daughter (Margaret Barr) is born

See ... Note, could be 1917, need to verify ...

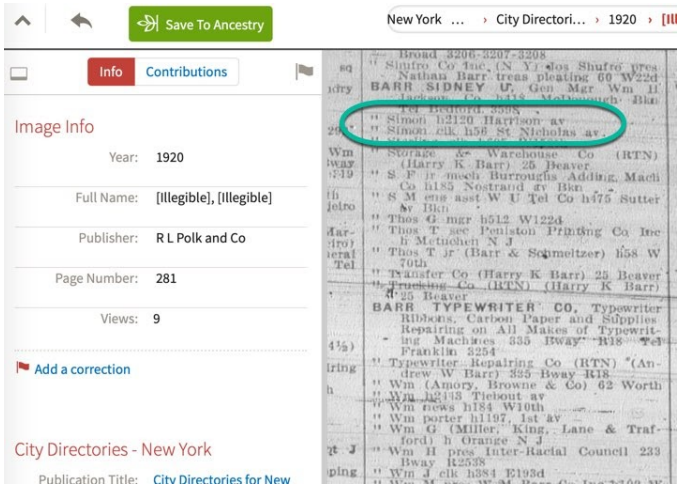
1920 Census - Simon Pelham Barr Not at parent's residence anymore

WHERE IS SIMON BARR (Or Pelham Barr) ??? There is no Simon Barr (or Pelham Barr), born in 1892, listed on any US Census for 1920

Address at this time is **"65 Lenox Avenue"** in New York City for **Philip Barr** and his family - Location on map, and picture of buildings at this address, is shown below. Note that 64 Lenox Avenue is between West 113th Street and West 114th Street in Manhattan.

See Philip Barr (born 1872) .

So where was Simon Barr living ? Note - See 1920 NYC directory clip below: [HD002E]***[GDrive] - Neither of these locations are in Manhattan, so not sure if either is correct. 2120 Harrison Ave is in the Bronx but it is close to the nothern tip of Manhattan.***



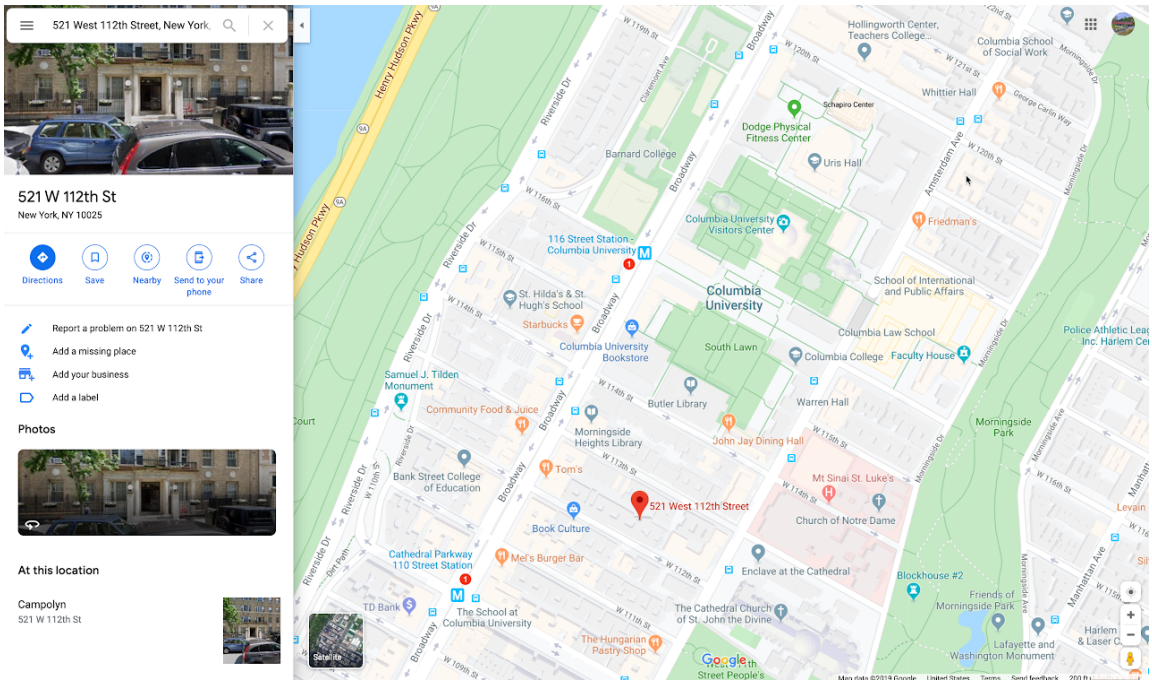
1921 (Aug 08) - Donald Barr (son) is born

Birthplace: Manhattan, New York,, United States [HL0024][GDrive] . See ... **Donald Barr (born 1921)** .

1924 (Aug 6) - Wife Estelle DeYoung Barr : School Dramas / Research

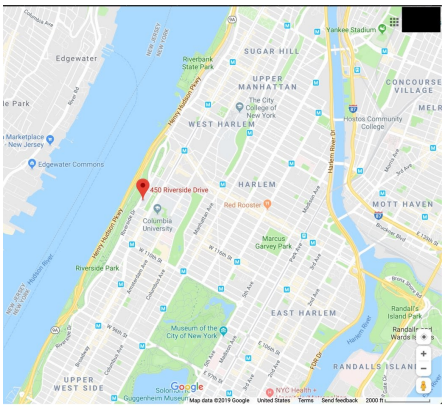
Being applied in Professsor Albert T Poffenberger's courses at Columbia University. Note that this informs us that Estelle de Young Barr is (as of August 1924) residing at 5**21 West 112th Street in Manhattan** .

See [HN00JF][GDrive] , or see the research page for **Estelle de Young Barr** (born 1893) .



1920s : Some time before the 1930 Census - Simon Barr and his family move to 450 Riverside Drive (NYC) is across the street from Columbia University

This is determined by the address that Simon Barr used for the 1930 Census ...



1929 - Drama and motion pictures - Is this Simon Pelham Barr ?

Full page : [HN00JA][GDrive]

CHURCH AND DRAMA ASSOCIATION HAS SPLIT-UP IN RANKS

Officers Connected With Motion Picture Industry Quit Jobs

BY LEMUEL F. PARTON

Copyright, 1929, by Cons. Press

New York —(CPA)—In the withdrawal of Carl E. Milliken and Will Hays from the board of directors of the Church and Drama association, a sharp issue of veracity is raised between Mr. Milliken, former governor of Maine and now secretary of the Motion Picture Producers and distributors of America, Inc., and Dr. George Reid Andrews, executive director of the Church and Drama association. Dr. Andrews said their withdrawal was due to the fact that the association had come to doubt the propriety of having representatives of the moving picture industry on its board. Mr. Milliken baldly replied that he and Mr. Hays withdrew because the association had tried to get money out of their organization.

The Rev. Dr. S. Parkes Cadman is president of the Church and Drama association. It is organized throughout the country, with a membership of about 20,000 and prominent clergymen and laymen on its directorate and managing board. For several years it has functioned in a unique manner by endorsing plays which it approved, rather than by condemning those which it disapproved. Its practice has been to include a list of plays and moving pictures thus sanctioned in a weekly bulletin sent out to its membership. This method was regarded by many liberal minded students of censorship as a possible solution of the perplexing problem of bringing public opinion to bear on the stage and cinema without recourse to negative censorship.

The experiment stirred interest at a time when the censorship menace was looming, and Mr. Hays, and Milliken accepted membership on the board. "Joint, constructive effort of public and producers in the interest of sound morality and good taste" was the objective of the association.

The break between the representatives of the motion picture industry and of the churches and their allies was sharp and unexpected. After stating that Mr. Andrews had "sought substantial amounts" for his association, Mr. Milliken says:

ASKS FOR MONEY

"On Oct. 4, 1928, Mr. Andrews, culminating a series of requests for money, addressed me as secretary of the Motion Picture Producers and Distributors of America, Inc. and said in a letter:

"Since we thus proclaimed our alliance with the motion picture group by placing Mr. Hays, yourself and Mr. Rubin on our board of directors, it would seem that financial support would be taken for granted."

"I shortly thereafter informed Mr. Andrews that we could no longer regard the church and drama association as representative of the protestant constituencies in cooperation with the motion picture industry, and our office ceased all official contact with his office."

Mr. Andrews today refused to make any statement in reply to Mr. Milliken and inquiries were referred to Pelham Barr, who denied that the organization was in any sense "representative of Protestant constituencies," and pointed out that its directorate and management included representatives of all major denominations.

The history of censorship in New York is an almost unbroken recital of futility and dissension—whether the censorship has been of the old-fashioned padlock school or the newer expedient of exalting good rather than decrying evil. Several years ago, Bishop William T. Manning, leading the committee of social service, organized a play jury, with the cooperation of the district attorney. So far as could be learned, the jury didn't even spear one over-ripe joke, and District Attorney Banton announced that he was through with it. It was dissolved. A committee of nine was then organized by producers, actors and playwrights. This also failed. During the years following 1923, the censorship problem was attacked by Bishop manning, Patrick Cardinal Hayes, John S. Sumner, the Bronx church league, the New York Federation of Churches, Judge C. F. Collins, Dr. Edward S. Young, president of the New York association for the suppression of crime, the Methodist Board of Prohibition and Public Morals, and many other organizations and individuals. They closed several plays, but most of the smutty plays collapsed before they got at them.

The Church and Drama association is a merger of the American Theatre association, the Church Drama association and the Drama League of America.

1932 (July) - Newspaper editorial - Simon Pelham Barr now working as writer for "Boot and Shoe Recorder"

Full page : [HN00J8][GDrive]

PAGE EIGHT

Public Asks For Values

People Are Tired Of Taking All Blame For Depression

Says Pelham Barr

Writer in Shoe Magazine Gives His Ideas On Current Times

The following article by Pelham Barr in the Boot and Shoe Recorder has been given to The Border Cities Star by Lt.-Col. George H. Wilkinson, V.D., with the suggestion that it be published:

GETS SORRY

I DON'T KNOW which are worse, the ads or the editorials, but every day and every hour I am getting sorrier and sorrier for myself for being one of the public.

By the time this is printed, I shall be one of the dear, great invisible hoarderence, exhorted and threatened, wheedled and shamed, into stopping my nefarious hoarding. Every time I go into the lobby of an office building or big store, every time I turn the radio knob, every time I go to the bank or to church, I shall be asked to put my hand into my inner vest pocket and pull out the $1,300,000,000 I have sewed up there.

The reason why I am hoarding, I have been told, is that I have lost faith in America. Business is all shot to pieces because it was I who didn't know it was loaded. It's all my childish perverseness. I have stopped buying for the same reason that kids won't go upstairs in the dark. In 1929 I continued to buy stocks for the same reason that babies suck their thumbs when they are told to stop. The only thing that's wrong with this country is my psychology. All this I have been told in ads and editorials and in the pleadings and denunciations of public-spirited citizens.

TWO CLASSES

Especially public-spirited citizens. The population of the United States, and of the whole world, is now divided into two classes: The public and public-spirited citizens. The public, of which I am a lowly member, is the caste which just sits around and does nothing until it is told, and then usually does the wrong thing. The public-spirited citizens are those who tell the public what to do. The highest rank in the public-spirited citizens caste is the "publicist." He is called that because he has no regular job. If he has a regular job, he is called economist, financier, industrialist, merchant, banker, college president, statesman, legislator, or public official. If you're just a storekeeper and mind your own business, you're one of the public.

PUBLIC DUMB

The public is dumb, in grery sense of the word. The public-spirited citizen is invariably articulate, besides being a great philanthropist, statistician, sociologist and inspired leader rolled into one. A member of the public gets into the headlines only if he murders or is murdered; a public-spirited citizen gets into the headlines by opening his mouth. The ultra-accomplishing public-spirited citizen can get into the headlines by keeping his mouth shut, especially when he should open it.

The best way to tell if conditions in this country are not so good is to see if there is an unusually large number of public-spirited citizens. In the last year or two they have outnumbered the seventeen-year locust by three to one.

1928 AND 1929

One of the reasons why I am beginning to be discontented with my membership in the public is that the public-spirited citizens who are telling us what to do now are the very ones who told us what to do in 1928 and 1929. Not that I harbor any peeve; I forgive and forget. I am a member of the public, and the memory of the public is like a sales-book with the carbon reversed. But I just can't help racking my numb brain and stewing around. Aren't some of these public-spirited citizens, the bankers, the very boys who started this hoarding?

They are. Last summer, while I was still a happy member of the public, I wrote my first article for this magazine. Not knowing any better, because no public-spirited citizen had told me, I tried to point out that the trouble with business was that the bankers thought that all the money belonged to them.

I was irreverent enough to indicate that the bankers were so scared out of their wits that they were frozen to their vault lids; that the credit policies to merchants and manufacturers were based on the idea that business was never again going to be good. Now, even the public-spirited citizens on the Potomac have begun to realize that all this bankers' talk about being liquid is just so much gas.

LIKE GANDHI

The bankers in the last two years became ardent followers of Mahatma Gandhi. They just sat right down on the railroad tracks and nuthin' was never goin' to go nowhere. But our legislators were too smart for the bankers; they sat down, too. Now they have discovered that they can't outsmart or outsit them and they are adopting new tactics. We and our legislators are now promising the bankers almost anything if they will only be nice boys and loosen up. Their securities have been marked up so that their statements can look prettier, while they kept on pounding the desk and bellowing at their customers to cut down their inventories. They have been given new gadgets for the reserve machinery. They have been given a Reconstruction Corporation so they can reconstruct what they tore down. They are being handed the money with which to loosen up!

But what are the poor devils of storekeepers and white-collar men and overall workers being promised? Don't be silly; it's all their fault. If they would only stop hoarding, prosperity would return. Is there a Reconstruction Corporation for unselling the goods which were sold at bankrupt prices? Is there a Reconstruction Corporation for reviving businesses which have been liquidated to death in the last two years? Is there a Reconstruction Corporation for mending hundreds of thousands of broken lives? Seat! You'll never grow up to be a public-spirited citizen if you talk like that.

The public must have confidence in bankers, even though the bankers have proved that they have no confidence in themselves. Do you know any ditch-digger or salesman or store-keeper who has made as many mistakes in all his life as some of our most public-spirited bankers have made in the last two years? But can it be that the public is coming to realize that the banker is just a store-keeper who handles paper (belonging to other people instead of strong iron, durable leather and colorful silk? Do we realize that the only difference between the banker and the hardware man, shoe man or drygoods man is that the banker's mistakes cause a whole lot more trouble?

The banking system of the country is and will remain sound; the doubtful banks have been made harmless. But our banking system is sound not because of the bankers but in spite of them.

BLAME ON WAR

Of course, it all goes back to the darn fool publics insisting on going to war with each other, in spite of all that the public-spirited diplomats, statesmen and permanent-makers could do. Now the darn fool publics have to pay for their war. But will they ever learn? No; at this very moment they are disrespectful to the public-spirited citizens from all over the world who have gathered in Geneva to decide who won the war.

All this isn't dead history; it's stop-press news of the day after tomorrow. It's this very public we are talking about which has got to get back the habit of coming into our stores and buying shoes at some kind of a profit to us. How are we going to get the public to do it? What methods should we use after all the methods which have failed and after all the campaigns for which the public has been the guinea-pig?

STOCKS ORGY

The "now is the time to buy stocks" campaign at the end of 1929 was responded to by an orgy of putting money into the bank. The public responded to the "buy now" campaigns of 1930 by an orgy of taking money out of the banks and putting it into steel vaults and cracked china teapots. What will will be the response to the anti-hoarding campaign with our public-spirited citizens acting like a combination of Texas Guinan and the Pied Piper of Hamelin?

If business picks up this year, as it may well do, the public-spirited citizens will claim the triumph of their advice over the foolishness of the public. No public-spirited citizen will admit, even if he knows, that business revival will be due to the renewal of saner credit policies and to the halt in the over-deflation of commodity prices; and that these will be due to the government's bribing of bankers to be bankers.

If the public comes back into the stores, don't give credit to the kind of advertising most stores have been running during the past year. Scolding ads, prosperity ballyhoo and "astounding cut prices" will not be the copy keynotes to make them buy.

NO CAMPAIGNS

Nor will nationwide campaigns and "movements" set the cash registers ringing. The public is just about tired to the jitters of being told that all that is the matter with it is "psychology." Mr. and Mrs. Consumer are just about fed up with being campaigned. They are tired to death of being "educated" to buy a bale of cotton, to love good music, to win the war by eating tin foil, to buy now, to stop hoarding and to have faith.

They are even more tired to an even deader death of being told that there is going to be a campaign to get them to do these things, and to read all the details of the machinery with which it is to be done.

Plastering all the campaign plans of a "secret" conference of public-spirited citizens all over the front page is, to the tired public, adding insult to injury.

Is it true that the American public is really as dumb as our merchandising and advertising experts believe it to be? Is there truth in the fixed delusion of our master propagandists that all they need to do to transform the public at will is an elaborately staged campaign with all the ropes and pulleys exposed? It is true that the same force which makes all the girls turn their hair into platinum can make men stop turning their bank accounts into gold?

CHANGING STYLES

Are we too well convinced that changing styles will pull the consumer's dollar out of the old sock, and even make him buy a new sock? Can a changing style do this even when there is no dollar or the consumer does not know where the next one is coming from?

What right have our merchandising experts to believe that all they have to do to get the consumer to loosen up is to announce that everything called George Washington this year will be the rage; and that nothing not called after the Father of Our Country can possibly sell?

We are told that the public this year is going to trip over its hair in rushing to buy George Washington golf shoes, Martha Washington lipsticks, Mount Vernon chop suey and Valley Forge electric refrigerators. But will they? If a lot of things called George Washington do sell, will it be because of bicentennial stamps and Parson Weems' cherry tree story, or will it be because the only kind of goods which the stores will carry will be named George Washington?

And how much will it matter what the technique of the advertising will be? As one of the public, I am supposed to respond feverishly when the style of type in ads changes. I'll admit, without being asked, that I am already bored stiff by the latest fad in type faces; and even by the one which may be expected in a few months.

But, as a member of the public, I will also admit that a new kind of advertising will be needed to get me into the store. It must have the novelty of being honest. It must have the novelty of talking my language. It must have the novelty of telling me about the goods and giving good reasons for buying them. It must have the novelty of flattering me by giving me credit for a little sense and a little self-respect. It must have the novelty of not blaming the depression on me.

1934 - Pelham Barr Appointed Divisional Director of the LBI (Library Binding Institute) - Remained Executive Director until 1947

[HX000E][GDrive] : *"Pelham Barr [...] Executive Director 1935-1947 "*

Below : See [HB0016][GDrive]

When the New Deal organized American industry under the National Recovery A c t (NRA) in 1934, library bookbinders began a cooperative program to insure standards of quality and fair dealing that has continued for fifty years. Library bookbinding in 1934 was a considerably different affair than it is currently. A host of small shops dominated an industry with very few "giants" and no consistent definition of what it was that was being sold as "library binding." Individual binders dealt with individual librarians without the benefit of broader consultation about standards and prices for their services. Cost accounting varied tremendously across the indus- try, making pricing of bindery services exceedingly difficult. Wide variations in labor practices further destabilized a market already hard-hit by the Depression.

Barr is influential in creating LBI

Into this scene came the faceless federal bureaucracy of the NRA National Code Authority - with a difference in the person of Pelham Barr. Barr had started his professional life as a chemist, politically active and committed to the goals of the New Deal. With the inauguration of the NRA in February 1934, a Book Manufacturing Institute was established, and Barr was appointed Divisional Director for Library Binding.He immediately set about applying Code provisions for self-government, labor standards, and fair competition across the industry. By November of that year, Barr was planning to extend his duties to include promotional activities for the industry as a whole, undertaken at the expense of divisional member binders.

1940 Census

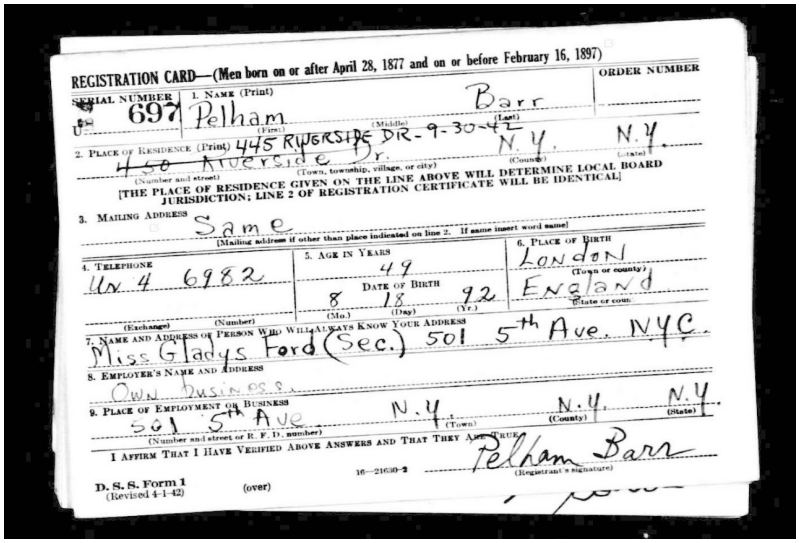
1942 (April 27) - Draft Registration for WW2

Note :

- Went by the name "Pelham Barr" (no middle name)
- Residence - 445 Riverside Drive
- Employment address - 501 5th Avenue NY NY
  - 501 Fifth Avenue is the "Astor Trvst Company" building -



REGISTRATION CARD—(Men born on or after April 28, 1877 and on or before February 16, 1897)

SERIAL NUMBER 697 | ORDER NUMBER

1. NAME (Print): Pelham (First) (Middle) Barr (Last)

2. PLACE OF RESIDENCE (Print): 445 RIVERSIDE DR. 9-30-42 (Number and street) (Town, township, village, or city) N.Y. (County) N.Y. (State)

445 Riverside Dr.

[THE PLACE OF RESIDENCE GIVEN ON THE LINE ABOVE WILL DETERMINE LOCAL BOARD JURISDICTION; LINE 2 OF REGISTRATION CERTIFICATE WILL BE IDENTICAL]

3. MAILING ADDRESS: Same [Mailing address if other than place indicated on line 2. If same insert word same]

4. TELEPHONE: Un. 4 6982 (Exchange) (Number)

5. AGE IN YEARS: 49 DATE OF BIRTH: 8 (Mo.) 18 (Day) 92 (Yr.)

6. PLACE OF BIRTH: London (Town or county) England (State or coun.)

7. NAME AND ADDRESS OF PERSON WHO WILL ALWAYS KNOW YOUR ADDRESS: Miss Gladys Ford (Sec.) 501 5th Ave. NYC.

8. EMPLOYER'S NAME AND ADDRESS: Own Business

9. PLACE OF EMPLOYMENT OR BUSINESS: 501 5th Ave. (Number and street or R. F. D. number) N.Y. (Town) N.Y. (County) N.Y. (State)

I AFFIRM THAT I HAVE VERIFIED ABOVE ANSWERS AND THAT THEY ARE TRUE: Pelham Barr (Registrant's signature)

REGISTRAR'S REPORT

DESCRIPTION OF REGISTRANT

RACE		HEIGHT (Approx.)		WEIGHT (Approx.)		COMPLEXION	
White	✓	5' 3½"		133		Sallow	
Negro		EYES		HAIR		Light	✓
Oriental		Blue		Blonde		Ruddy	
Indian		Gray		Red		Dark	
Filipino		Hazel	✓	Brown		Freckled	
		Brown		Black	✓	Light brown	
		Black		Gray		Dark brown	
				Bald		Black	

Other obvious physical characteristics that will aid in identification: Scar on forehead

I certify that my answers are true; that the person registered has read or has had read to him his own answers; that I have witnessed his signature or mark and that all of his answers of which I have knowledge are true, except as follows:

Marie J Church (Signature of registrar)

Registrar for Local Board 37 (Number) N.Y. (City or county) N.Y. (State)

Date of registration Apr. 27, 1942

Local Board No. 37 23
2875 Broadway, Room 10 061
New York, N.Y. 037
(STAMP OF LOCAL BOARD)

(The stamp of the Local Board having jurisdiction of the registrant shall be placed in the above space)

16—21630-1

[HB0013] Source : Managing a Library Binding Program By Jan Merrill-Oldham (1993)

See [HB0016][GDrive]

COOPERATION.. .STANDARDS. . .COMMUNICATION.. .are focal points of this brief history of The Library Binding Institute written by Brian J. Mulhern. Mulhern (BA in history and English, Carle- ton College, Northfield, Minnesota, and an Main American Studies, University of Minnesota) is an archivist and writer who worked part time for LEI for several months. He began organizing the old LBI files and setting up the archives.

When the New Deal organized American industry under the National Recovery A c t (NRA) in 1934, l i b r a r y bookbinders began a cooperative program to insure standards of quality and fair dealing that has continued for fifty years. Library bookbinding in 1934 was a considerably different affair than it is currently. A host of small shops dominated an industry with very few "giants" and no consistent definition of what it was that was being sold as "library binding." Individual binders dealt with individual librarians without the benefit of broader consultation about standards and prices for their services. Cost accounting varied tremendously across the indus- try, making pricing of bindery services exceedingly difficult. Wide variations in labor practices further destabilized a market already hard-hit by the Depression.

Barr is influential in creating LBI

Into this scene came the faceless federal bureaucracy of the NRA National Code Authority - with a difference in the person of Pelham Barr. Barr had started his professional life as a chemist, politically active and committed to the goals of the New Deal. With the inauguration of the NRA in February 1934, a Book

Manufacturing Institute was established, and Barr was appointed Divisional Director for Library Binding.He immediately set about applying Code provisions for self-government, labor standards, and fair competition across the industry. By November of that year, Barr was planning to extend his duties to include promotional activities for the industry as a whole, undertaken at the expense of divisional member binders.

These activities won the enthusiastic support of the depression-stricken industry. When the NRA was declared unconstitutional in May 1935, members of the previously involuntary federal program voluntarily resolved to continue the program on an independent basis with Barr at i t s head. At the hour of decision, Barr enthusiastically anticipated the binders' choices:

> *Library binders a l l over the country are continuing to do business "as was" before the decision. They realize that it is the only safe and sane way to do i t . They didn't have to be told that it would be plain damn-foolishness--suicide--to t r y to go back to the old days when some of their competitors indulged in price-wars, quality chiselling and labor sweating. . .Here's one case where cooperation and selfishness are identical--broad vision is right at the end of the pocket-book nerve.*

Joint Committee Plays Major Role

Even before the group became an independent entity, a program of cooperation had been undertaken with the American Library Association's Bookbinding Committee founded in 1933. In January 1935, three binders were delegated to meet with the ALA in what subsequently became known as "the Joint Com-mittee." Cooperation with librarians became a keystone of the new organization's policy. The Joint Committee consulted on virtually a l l facets of the LEI program. It played a major role in shaping binders' "Guide to Fair Value," (1934), their "Minimum Specifications for Class 'A' Library Binding" (June 1934, revised June, 1938) and their "Certification Plan" (1936). For twenty years following LBI's first annual meeting in 1936, i t s annual get-togethers were planned to coincide in a joint session with the annual meeting of the ALA.

The relationship with the ALA focused LBI's public relations effort on the Library Journal, and for years Pelham Barr provided the Journal with a steady stream of contributions interpreting bindery services and activities. After September 1939, the Institute launched a publication of its own, Book Life, specifically directed at bibliophiles and persons interested in book conservation, another early concern of the bindery group. Barr particularly excelled at these public relations efforts, and he valued them so highly that he donated a portion of his own 1939 salary raise so that his long-standing dream of such a publication might become a reality. LBI's first director also contributed to a wider spectrum of publications, including Bookbinding Magazine, College and Research Libraries, and Bookbinding ggg Book Production, as well as generating a steady stream of informal and entertaining communications with LEI-members and other interested people. From the fi r s t , open communications have played a central role in the affairs of the bindery group.

Gathering statistical information was important

Information flowed in both directions from the earliest days of LBI. An important function of the Institute was the collection of statistical information regarding the industry: i t s volume, i t s suppliers, i t s income, and i t s expenditures. Annual surveys were made of such information, and occasional special surveys were held regarding issues of widespread interest. Reciprocally survey findings were shared with mem-bers to assist them in planning and evaluating their own operations; and the Institute also served occasionally as a conduit for statistical data compiled by the federal govern-ment regarding the binding industry.

To be sure, services to members were not purely statistical. LBI organized members to resist incursions of New Deal work-projects on the binding trade. It disseminated preservation information to members hard-hit by a series of disastrous floods in the late 1930s. With the coming of war in 1941, it kept members posted on coping with shortages of bindery materials, brought on by war-time conditions.

Over the years it interpreted f o r members a host of new federal regulations and legislation. Regular newsletters to members appeared as early as 1935, and LBI annual meetings began in 1936, featuring management and technical sessions to upgrade members s k i l l s in business and production procedures. Given the range of services to members, it is surprising that the fledgling group was able to maintain relatively low dues and to stay within a modest budget in the midst of a lengthy business recession that cut heavily into member-binders' incomes. But the industry stalwartly supported i t s trade association, which in turn responded with some flexibility to the financial plight of individual members. Balanced budgets were to become a tradition in succeeding years. T o -gether, the industry weathered the most harrowing business downturn in American history.

Prices and Products Standardized

Meanwhile they went about systematizing t h e i r mode of doing business. To stabilize binding prices, they developed a "Guide of Fair Value for Library Binding" while s t i l l under NRA jurisdiction. The guide was approved by the Joint Committee and ratified by the newly independent Institute after it formed. Periodic revisions in May 1937, October1941, December 1943, August 1945, attempted to keep pace with and personnel costs. In the words of the first announcement for the guide:

The approval of the Guide of Fair Value and of the Minimum Specifications is an important element in the cooperative program of the Joint Committee to develop sound relations between librarians and binders--to put transactions on a basis of fair dealing and fair competition; to assure librarians of a good quality binding at a fair price which will enable the binder to use standard quality materials, give good workmanship and pay his employees fair wages.

Besides standardizing their prices, binders sought to standardize their products. Initially, product standardization took the form of production specifications enumerating various features of the binding process that were deemed to constitute binding particularly suited for library use. The first "Mini-mum Specifications for Class 'A1 Library Binding" were formulated by the ALA Bookbinding Committee in 1934 as the culmi-nation of a consensus emerging in the trade since at least 1923. The Joint Committee ratified this consensus in 1935 and revised it in 1938. chiefly to accommodate the growing use of pyroxylin-impregnated fabrics in library binding. The original specifications referred to books and magazines. By January 1938, the group had adapted i t s standard to the binding of newspapers. The following year it issued specifications to govern the binding of "reinforced (pre-library-bound) new books."

To reinforce the legitimacy of these standards LBI issued a certification plan in 1936 f o r binders who demonstrated work in conformity to both the minimum specifications and the guide to fair dealing. At least initially certification was not made a prerequisite f o r membership in the association. ***A July 1936 letter from Pelham Barr reassured non-certified members that their membership was not in jeopardy under the new certification plan, and this dispensation apparently prevailed for several years thereafter****. A board of review was convened in connection with the plan to monitor applications for certified status.*

LBI supplies technical advice to members

LBI began early to offer members technical advice in order to help them conform to the prescribed specifications. Pyroxylin was evaluated in 1936. Buckram was repeatedly tested f o r resistance to moisture and abrasion by the early 1940s. Beginning in 1936, both members and librarians were advised on precautions regarding mildew. A series of bulletins issued in-I94l-I942 advised members on how to meet production standards in the midst of war-time supply shortages. Such piecemeal tinkering with production specifications would continue until the early 19608 when heightened technical capabilities made possible the develop-ment of performance standards to supplement these production specifications. Since that time Institute standards have been defined increasingly in terms of durability

under a wide variety of environmental conditions. Empirical testing has yielded a progress-ively more sophisticated specification of library binding. The 1976 inauguration of an LBI book-testing laboratory at the Rochester Institute of Technology (RIT) is merely the most recent phase in the binders' effort to refine and certify the standard of quality in their field.

The standards program, along with membership services, and a concerted public relations campaign with librarians define the earliest phase of LBI's existence, roughly coterminous with the directorship of Pelham Barr. Barr tirelessly pursued these efforts until his health broke down in 1947, and he died early in the following year.

Brownning becomes Executive Director

Binders next turned to a librarian, Earl W. Browning, to head their organization. Browning, formerly of the Peoria Public Library, had been a member of the Joint Committee during i t s earliest years, 1934-1937. His administrative skills, contacts with librarians, and long-standing interest in library bookbinding particularly recommended him to LBI directors seeking a new leader.

In fact, Browning's tenure as LBI Executive Director appears in retrospect as little more than an interregnum. Within four and one-half years of becoming LBI director in April 1948, Browning had resigned. While director, he concentrated his energies on representing librarians' interest in library bookbinding. Browning's program for membership I.D. cards and the use of LBI insignia in advertising were cal-culated to assist librarians searching for quality binding. He dispensed with restrictions barring librarians from the technical sessions at LBI annual meetings. Technicalities subsequently discussed tended more to benefit librarians than binders in attendance at the meeting. Browning enthusiastically toured the circuit of library meetings with his exhibit on the use of standardized lettering in binding, and he filled LBI newsletters with reports of his attendance at such gather-ings. A major publication of the Browning years, the Librar Binding Manual (1951), was actually published by the American Library Association and addressed itself chiefly to a library audience. It constituted a sort of primer for buyers of library binding. Originally co-authored by Louis N. Feipel and Earl w. Browning, the manual was revised and expanded over the years, culminating in Maurice Tauber's 1971 revision published by LEI.

Other significant publications of the Browning years were more geared to the needs of LEI-member binders. During 1951-1952, l e g a l memoranda on wage and salary stabilization equipped members to comply w i t h t h e Defense Production Act of 1950,inspired by the outbreak of hostilities in Korea. These memoranda reflect the growing importance to the organization of a l e g a l acumen beyond the ken of Browning, and he resigned and moved to California in September 1952, following the death of his wife.

PITT MAN WINS AWARD.

The New York School of Philanthropy has awarded a $600 fellowship to Ben M. Selekman, who will graduate from the school of economics of the University of Pittsburg, June 16. The award was made after a competitive examination in which there were 64 entries for four fellowships. Miss Estelle DeYoung, an alumna of Barnard college, who will receive her A. M. degree from Pitt at the June commencement, was awarded one of the fellowships.

H. J. Heinz will speak at the student assembly of the university in Soldiers' Memorial hall at 11:30 o'clock next Monday.

The faculty and students of the School of Education will have a picnic tomorrow afternoon.

The French club of the University of Pittsburg will hold an open meeting in Thaw hall at 8:15 o'clock tonight.

Rev. Raymond L. Archer, a missionary of the Epworth league of the Smithfield Methodist Episcopal church, spoke at the student assembly today.

The Musical clubs gave a dinner at the Monongahela House Wednesday night.

College freshmen held a picnic in Schenley park Wednesday afternoon, Dr. and Mrs. J. L. Jones, Mr. and Mrs. L. J. Heath and Sterling A. Zimmerman were the chaperons.

Abraham Epstein, member of the Collegiate Anti-Militarism league, has obtained the signature of 500 students to a message to the students of Japanese universities asking co-operation in trying to remove suspicion between the United States and Japan.

For the first time women will be in attendance at a banquet of the Evening School association of the University of Pittsburg when the final dinner is held at McCreery's on Thursday evening, June 10. About 400 persons are expected. Addresses will be made by Prof. Aubrey L. Ashby and other members of the faculty of the school of economics. The examinations in the evening school closes Monday.

LABORATORY METHODS APPLIED TO DRAMA

"Laboratory" methods are being applied to the drama by the Summer Session students in Prof. Albert T. Poffenberger's courses at Columbia University. The experiment, directed by Mrs. Estelle DeYoung Barr of 521 West 112th street, Manhattan, a graduate student in psychology, is said to be one of the first, if not the first, of its kind.

"The play chosen," said Mrs. Barr, "is the Theatre Guild production of 'Fata Morgana', by Ernest Vajda, because it offers two phases of psychological study at the same time: the reaction of an audience to a powerful situation and the psychology of the characters in the play as portrayed by the dramatist.

"Such a study is of educational interest because it bears on the problems of development during adolescence and the effects of emotional crises on this development. The theme and action of the play are such that it affords proper opportunity for studying the motives and emotions of the characters and it also enables the students in the audience to note their personal reactions.

"The method used is that of the unidentified questionnaire. This offers a series of questions relating to both phases of the experiment and is distributed and filled out by the students at a definite time during the performance.

"In general, the results of this experiment will bear on such questions as the effect of first love experience on the emotional life of the adolescent; age disparity in love relations; different reactions of individuals of different sex, age, education and interests to a common dramatic stimulus. Summer Session students, because of their range in these differences, are especially good 'subjects' aside from their interest in their studies.

"There are clearly a number of aspects to this experiment which should lend themselves to popular but dignified newspaper treatment. For instance, do women object more than men to love between an older woman and a younger man?

"Is such an experience 'good' or 'bad' for a youth? Does the attitude of women towards such a situation change as they grow older? Has the education of the individual any relation to his or her 'moral' outlook? Do married people view 'love' differently from single people? These are only a few questions to which the results of this experiment may offer an answer."

1934 - "A psychological analysis of fashion motivation" by Estelle De Young Barr

Published 1934 in New York .

Written in English.

Barr (1934) investigated the diffuseness and intensity of fundamental drives as related to dress: the desire to conform, desire for economy, attitudes related to modesty, desire for comfort, the aesthetic impulse, and desire for self-expression. Her findings indicated that the desire to conform was the most diffuse of the desires measured. Conformity was more effective as a determiner of the time of buying clothing than was the desire for economy. The desire to conform varied with the technical or professional interest of the group.

1910 Census

"Simon has disappeared from his name an he now goes by "Pelham Barr". He married Estella De Young, and Donald E. Barr is their son. His parents are now said to be from Poland." Original Tweet Source : [HT0030][GDrive]

Philip Barr, the head of the family and father of **Simon Pelham Barr**, is a "Maker Furs", and works out of the house (family home). The 1920 Census shows that Philip Barr is a "Furrier", validating the "Furs" part of his trade.

The full census sheet for 1910 (and at a higher resolution) is available here : [HS0015][GDrive]

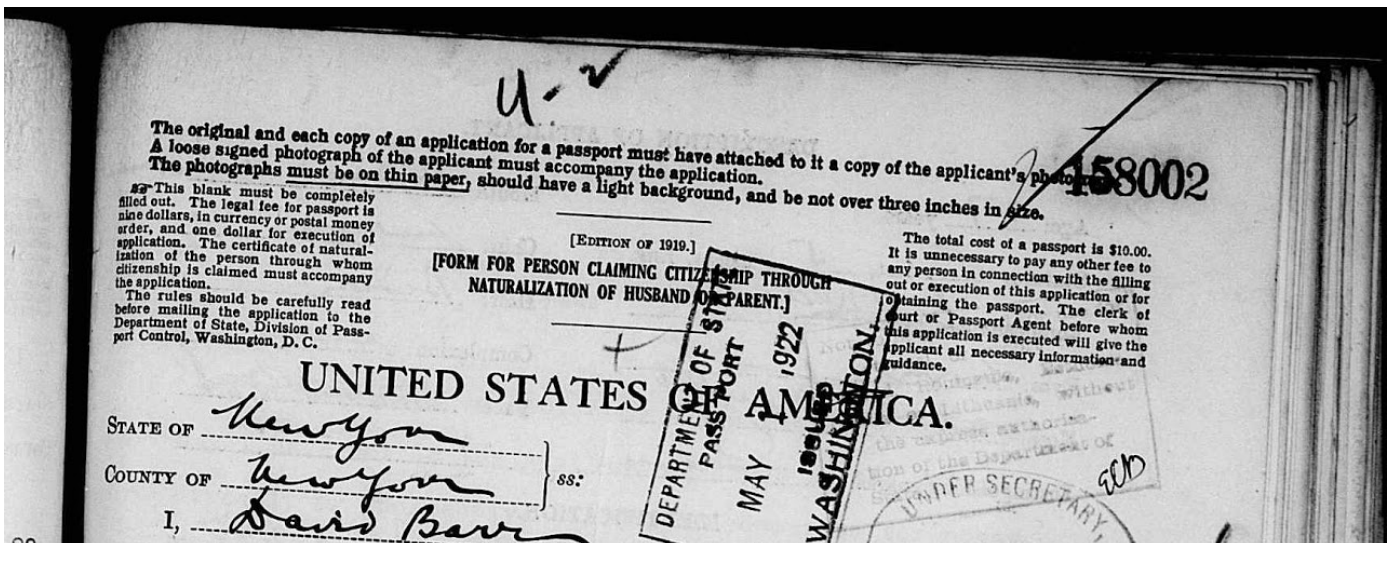
1922 - Citizenship / Naturalization Claims

Below : [HG0021][GDrive]



U-2

The original and each copy of an application for a passport must have attached to it a copy of the applicant's pho
A loose signed photograph of the applicant must accompany the application.
The photographs must be on thin paper, should have a light background, and be not over three inches in size.

158002

This blank must be completely filled out. The legal fee for passport is nine dollars, in currency or postal money order, and one dollar for execution of application. The certificate of naturalization of the person through whom citizenship is claimed must accompany the application.

The rules should be carefully read before mailing the application to the Department of State, Division of Passport Control, Washington, D. C.

[Edition of 1919.]

[FORM FOR PERSON CLAIMING CITIZENSHIP THROUGH NATURALIZATION OF HUSBAND OR PARENT.]

The total cost of a passport is $10.00. It is unnecessary to pay any other fee to any person in connection with the filing out or execution of this application or for obtaining the passport. The clerk of court or Passport Agent before whom this application is executed will give the applicant all necessary information and guidance.

UNITED STATES OF AMERICA.

STATE OF New York
COUNTY OF New York } ss:
I, David Barr

DEPARTMENT OF STATE PASSPORT MAY 1922 ISSUED WASHINGTON

UNDER SECRETARY

THE UNITED STATES, hereby apply to the Department of State, at Washington, for a passport.

BARR, a NATURALIZED AND LOYAL CITIZEN OF

I solemnly swear that I was born at London, England

on or about the 29th day of August, 1894;

that my {father / husband}, Philip Barr (Name.) was born in Russia (Country.)

that he emigrated to the United States, sailing on board the

from Liverpool on or about June 1, 1907;

that he resided 14 years, uninterruptedly, in the United States, from 1907 to 1922

at New York City, N.Y. that he was naturalized as a citizen

of the United States before the Supreme Court of New York County

at New York City, N.Y., on June 2, 1913

as shown by the accompanying Certificate of Naturalization; that I am the Son of the person

described in said Certificate; that I have resided in the United States, uninterruptedly, for 14

years, from 1907 to 1922, at New York City, N.Y.; that I am domiciled in the

United States, my permanent residence being at 65 West 11th St., in the State

of New York, where I follow the occupation of Lawyer & Writer

My last passport was obtained from

and was (Disposition of passport.) on (Date.)

I am about to go abroad temporarily; and intend to return to the United States within 9 months

with the purpose of residing and performing the duties of citizenship therein; and that I

desire a passport for use in visiting the countries hereinafter named for the following purpose:

(Name of country.)	(Object of visit.)
France	Pleasure & Travel
England	Pleasure & Travel
Holland	Pleasure & Travel
Germany	Pleasure & Travel
Poland	Newspaper Work

I intend to leave the United States from the port of New York (Port of departure.)

sailing on board the Lapland (Name of vessel.) on May 18th (Date of departure.), 1922

OATH OF ALLEGIANCE.

Further, I do solemnly swear that I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; and that I take this obligation freely, without any mental reservation or purpose of evasion: So help me God.

(Signature of applicant.)

Feb. 11/1922

Dear Brother:

I thank you very much for the $50 which you sent me, thru Clara. The entire time I did not have your address and therefore could not write to you when we returned from Russia. To describe our lives for the last 7 years would take up too much time. We will delay that for another time or till we will meet personally. During this time specially from the Bolsheviki, we have suffered very much.

I have been very wealthy but the bandits have taken everything. In short, my financial standard is very tragic. Unfortunately I became very ill owing to the trip and I was sent to Otvatsk near Warsaw to recuperate. While here I got a hemorrhage from the lungs but luckily I was already in Otvatsk. The air here is very good and the sanitarium give good food so I soon became better, and now I am entirely well but in order to work the doctors say I must be here another 2 months. Dear brother, for all this I need money and I am now in a terrible position. The money you all sent me came in very handy. We paid a few of our debts but nothing was left for the future. I beg you, if it is possible, you should help me out. Your money will not be lost, with me no one has lost.

I will return to the city and open a small business, I will be soon on my feet, especially in Russia because there are my many millions.

Your brother

Mr. David S. Barr, Washington, D. C.

https://www.leagle.com/decision/19661197355f2d8421974

https://newsguild.org/home-2/david-s-barr-award-for-student-journalism/

DAVID S. BARR was much more than a lawyer to those privileged to know and work with him. He was the Guild's mentor, advisor, role model, institutional memory and friend. Before starting his own practice and representing our union and others, Barr was a National Labor Relations Board attorney. He was passionate about justice and fairness and viewed journalists as agents of those virtues. In his name, The NewsGuild-CWA awards annual scholarships to one high school and one college student journalist whose work focuses on issues of social justice. Barr had represented the Guild for more than 20 years when he died of a heart attack in 1997.

Elinor Sachs Barr (born 1894)

ELINOR SACHS

"To love, to wealth, to pomp I pine
and die
"With all those living in philosophy."

1917 Columbia College Yearbook
[HT003N][GDrive]

- **Born -** June 10 1894 (see discussion below)
- **Death -** 1990 (March 23) (https://www.findmypast.com/transcript?id=US/TRIB/009865910)
- **PARENTS -** Daughter of Samuel Sachs and Fay Sachs
- **MARRIAGE** - Husband of **David S Barr** (born 1894)
- **CHILDREN :**
  - **Paul S. Barr** (born 1927)
- **SIBLINGS:**
  - **Herman Alexander Sacks (born 1885)**
  - **Alexander Sachs** (born 1892)
  - **Joseph Alexander Sachs** (born 1896)
- **OTHER FAMILY** :
  - In-laws (via **David S Barr** (born 1894)) :
    - Brother In-Law **Simon Pelham Barr** (born 1892)
- **Profession** -

Eleanor (or Elinor Barr) - Conflicts of birth dates and name spelling on federal records

Two death certificates :

1. Eleanor Barr ; June 16 1896 to Sep 1979 (https://www.findmypast.com/transcript?id=US/TRIB/005839593) - Nyack, NY
2. Elinor Barr : 10 Jun 1894 to 23 Mar 1990 (https://www.findmypast.com/transcript?id=US/TRIB/009865910) - New York City

Marriage certificate of "Elinor Sachs"(See transcript : [HL001T][GDrive])

- Elinor is age 26 on a 17 Feb 1922 wedding to David S Barr.. and born in 1895 (some forums suggest 1896, but we know with certainty her brother **Joseph** was born in 1896)
- A June 16 1895 birthday would make her () on a January 1910 census

So the "Elinor Sachs" on the wedding certificate that marries David Barr on Feb 17 1922 ... is birthday-matched with the death certificate for "Eleanor Barr" (June 16 1896 to Sep 1979)

Also note : from the Alexander Sachs notes from FDR Library (at Marist College)

[Download list at : 2014-fdrlibrary-marist-edu-papers-of-alexander-sachs-1874-1973.pdf / https://drive.google.com/open?id=1XVxipo772hakT_ZPpzrwEh4qy-DicV8-]

In here on page 12 of 88, it is listed that Alexander Sachs had email correspondence with "Mrs. Elinor barr"

1904 (Feb 5) - Passenger info, voyage arriving in New York City (from Hamburg) on Blucher

"Sohone Saks" (age 40), Shamal (age 11), Lie (age 9),and Jossel (age 7) - Husband "Sundel Saks" in New York

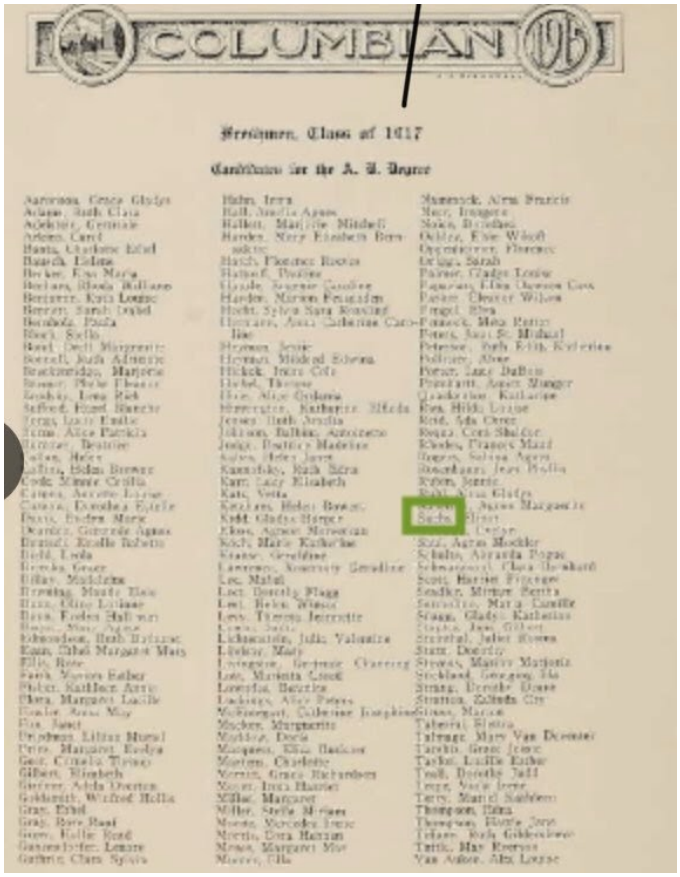
[HT003F][GDrive]



COLUMBIAN 1917

Freshmen, Class of 1917

Candidates for the A. B. Degree

[HT003G][GDrive]

To the Editor of the BULLETIN:

In the last few weeks most people, from our duly-constituted authorities down to the patriotic business firms that fly flags and offer special terms for war contracts, have been *doing* rather than *thinking*. The "hoi polloi" are further kept from considering the issues by managers of vaudevilles and motion picture houses who stimulate unthinking patriotism (and, incidentally, applause for the most atrocious "act"), by striking up the "Star-Spangled Banner" and by constant allusions to German atrocities.

I should like to suggest just two questions:

1. Have the countries against whom we are about to declare war been the only, or even the chief, infringers of international law?

2. Would the United States advance the cause of international law and of *peace* by entering into the war?

ELINOR SACHS, '17.

Coming here in 1888, Mr. Rosenblatt succeeded in building up a very big business, and he is known as one of the most successful business men of Greater New York.

Success has not spoiled him, but, on the contrary, has urged him to place himself at the disposal of the community. He is vice-president and chairman of the Membership Committee of the Hebrew Sheltering and Immigrant Aid Society of America, founder and first president of the Bath Beach Free Loan Association, a director of the Ninth Street Y. M. H. A., of Brooklyn, of the Bath Beach Y. M. H. A., of which he is the former president, Congregation Sons of Israel, Zion Hospital and Brooklyn Federation of Jewish Charities.

A Laudable Activity of the Council of Jewish Women.

There are a few fundamentals in what we term Americanism. A speaking, reading and writing knowledge of English is one of these basic principles. Without this the alien can not make real contacts with Americans, American customs, institutions and ideals. The Council of Jewish Women, therefore, has made its own Americanization endeavor an effort to promote literacy in English as the fundamental, unifying force in Americanization.

That the existing educational facilities for alien girls and women are inadequate was ascertained in a number of studies made by the Department of Immigrant Aid of the Council of Jewish Women in a few typical centers with considerable alien populations. Nearly half of the states make no provision in their constitution for the establishment of evening schools. In other states, also, there is no provision for the education of adult foreigners. And there are nearly six million people in this country who can not read and write English. The inadequacy of the night school to meet the needs of the illiterate alien woman and girl is shown by their slender enrollment and their slenderer attendance at the evening schools. The reasons for this are: Long working hours and consequent fatigue; normal desire for recreation; home duties; discouragement over slow progress in classes which are heterogeneous in age, nationality and degree of previous education; lack of interest in school curriculum; poor teaching conditions and standards.

Only about one per cent of the mothers attend evening school, for they are overburdened with home cares. To compensate the illiterate woman or girl for the sacrifice she is making in going to evening school, and to make it worth her while, the teaching and the curriculum should be especially interesting and pertinent. But as long as the foreigner is considered as "only a grown-up child," and night school teaching as an extension of the day school, the evening school will fail to attract those whom it ought to reach.

The program of the Department of Immigrant Aid, as stated in their STUDY in LITERACY and AMERICANIZATION PROGRAM, just published, is: "To promote, in co-operation with local school boards, boards of trade and other civic agencies, extended facilities for the education in English and citizenship of the alien girl and women." It includes:

1. Small group homogeneous classes for mothers in tenements and neighborhood centers.
2. Small group homogeneous evening classes for girls.
3. Classes in factories conducted during working hours.

Although the total illiteracy among mothers has been found by the Department's investigations to be as high as from 35 per cent to 50 per cent, and the illiteracy in English still higher, there is no corresponding degree of apathy. Where it is humanly possible for them, the women are eager to learn English. This flickering interest is fostered by personal friendly contact with Americans.

A number of the Council Sections have demonstrated that mothers' classes are a possibility and a success. The organization of such classes has followed the systematic visiting by a Yiddish-speaking investigator, sympathetic to the needs of the alien women, in several Jewish communities. Publicity in English and Yiddish are brought to them through personal visits, through Yiddish newspapers, and by displaying signs in places they frequent.

The publicity for girls' classes is made through talks at the noon hour in the factory, and through pay-envelope-slip announcements which the Council supplies and which the employer puts into the envelope.

The Council recognizes that adult alien education is properly an integral

Who Is He?

Editor ISRAELITE:

Sir—One of your readers acquainted with modern Russian literature might be able to solve the following puzzle: One Wladimiro Frenkel recently published an Italian pamphlet, entitled "Finis Russiae?" (Rome, 1918), in which the following passage occurs:

"The second Russian revolution is the fulfillment of the terrible prophecy of Dostoyefski that Russia will perish through the Jews, as the Polish rabbi, Imirzehascem, predicted, the same Jews who were oppressed, pillaged, tortured and assassinated under the dominion of the Teutonic Pharaohs in the Romanoff empire."

Is the author with the unmistakably Jewish name a missionary or an apostate, hired by the Black Hundred, or is this name a mere hoax, invented to create the impression that the Jews are self-confessed plotters against the future of Russia? The "Rabbi Imirzehascem" is a mere hoax. The word means, "may it be God's will."

INQUIRER.

Women in the Quorum.

Editor ISRAELITE:

Sir:—Quoting the London Jewish Chronicle's suggestion of having counted women as among the ten adults necessary for holding religious services, THE ISRAELITE, in one of its editorial notes of a recent date, makes mention of the fact that Dr. Isaac M. Wise, father of American Reform Judaism, had this innovation introduced over sixty years ago, remarking at the same time that our English brethren are 62 years behind the times.

One, however, does not need to cross the Atlantic in his quest for people who are behind the times in this particular tradition of the constitution of the quorum for divine services. There are thousands and tens of thousands of Simon pure Orthodox, reasonable (?) Orthodox, nominal orthodox and all sorts of adherents to their peculiar doxies, who will emphatically refuse to accept women in the Minyan, Dr. Wise's introduction of sixty-two years ago and the Jewish Chronicle of our own time's approval notwithstanding. Rabbinical sources and the Jewish Codices are somewhat silent on the matter, although the Talmud and the Schulhan Aruch unhesitatingly admit women to the septuary required for the participation in the recitation of the Pentateuch, on Sabbath mornings, (Megilah f. 23, a). Again, the very institution of the Minyan is but a matter of speculation and uncertainty, the number being, rather, reduced to six or seven, which are properly backed and substantiated by a Scriptural command of six words terminating with the Deity, the idea advanced by one of the rabbis is that six persons may praise the Lord; another rabbi, however, wants a seventh man responding to the word of Lord as to the previous dicta of lesser import (Sopherim x, 7). While, the reason for the necessity of ten to constitute the Minyan, namely, the number of the scouts and the spies that brought evil reports and slandered the Holy Land, after the discount of Joshua and Caleb (Megilah f. 23, b), smacks much of a joke of the rabbis' humorous witticism. But then, it might have predicted the American Synagogs, the sincerity of some of their members being doubtful, indeed, strife and discontent reigning supreme, here, there and everywhere.

Now, since there was never specified the predilection of men over women, in any of the mentioned Talmudic places, why is the woman tabooed in the Minyan?

NACHMAN HELLER.

HOW CAN GERMANY PAY?

Question of the Money Demanded for Reparation and Restoration.

[From the New York Journal of Com-

part of the public educational system and that it behooves the school board to develop educational facilities acceptable to the adult alien. The Council, therefore, whenever it has opened a center has tried to get the co-operation of the school board and other civic agencies. Until the suitable teacher is secured from the school board, the organizer leads the classes, thus establishing friendly personal contact, which is maintained in the follow-up by home visiting, in order to deepen the interest and increase the attendance. The importance of getting the right teacher can not be overemphasized. Such a teacher, who knows her pupils' home background, their conditions and the best way in which to meet their practical needs, may often be found in the ranks of those who have married and are no longer teaching.

But small group classes can not be far-reaching enough to affect, materially, the problem of illiteracy. The only effective means of overcoming illiteracy and inducing good citizenship is by combining the industrial contacts with the educational contacts. The illiterate alien must be reached where he is most often found—in the factory. The worker, the employer and the community are the gainers. The factory class acts as a stimulus to the ambition of the worker; it is an asset to the employer in that it creates an intelligent and literate labor force; and lastly, it is the only adequate means of reaching the large masses of illiterate workers so as to make them fit to share intelligently in developing the democratic American ideal of government.

The Department of Immigrant Aid, therefore, is making the establishment of factory classes the main objective of its Americanization work for girls just as it is making the small group homogeneous class its main objective for mothers in the home.

The Department of Immigrant Aid, C. J. W., has the following personnel: Helen Winkler, New York, chairman; Elsa Alsberg, New York, secretary and

Any acquisition of Germany's own soil, the ancient method of forcible acquisition of territory is apparently out of the question as a means of adjusting the righteous war claims of the belligerent nations so deeply wronged by the Germans.

Most of the German debt is held by her own citizens. Owing to the peculiar conditions of blockade under which the war has been waged, Germany has found it difficult to place loans in other countries. A few bonds were sold during the first year or two of the war, and still fewer at a later date, but the total is very small. The debt is held by the German people, who are the ultimate source from which the burden of Germany's restitution must be drawn. With this domestic debt wiped out, repudiated, or deferred to a distant future, Germany can approach the allies with the offer of an annual payment in some agreed form for the adjustment of her debt. Inasmuch as a long period of rebuilding must be expected before even a small part of German damage can be made good, an annual liquidation of the costs of the operation might be as effective a means of paying the debt as any that could be devised. German industry can be set at work to produce the materials, machinery and equipment that will be needed in the process of restoring the district of northern France that has been laid waste as well as the shipping to recreate the merchant marine that has been sacrificed to the "ruthless" type of warfare.

Such an annual tax may be stated in terms of money, but the actual settlement of it must come as a regular deduction from the output of German mines, forests and factories, from customs taxes or a tax upon transportation until the debt has been made good. When settlement has thus been gradually accomplished it will be time enough for the German constituted authorities to consider the question of th own people for parted with for

The Reconstruction Unit of the Council's Committee on Reconstruction sailed for Europe on April 12. The members of the unit included Mrs. Edgar Strukosch, director, who has been the headworker at the Emanu-El Sisterhood of Personal Service, New York City; Miss Elinor Sachs of the Council's Department of Immigrant Aid; and Miss Clara Greenhut of New York City. As the Unit sailed on the Aquitania, they wore a Council uniform, somewhat similar to the one that is used by members of service organizations abroad. The Unit will proceed to Rotterdam where, with the co-operation of the local community, such social service and immigrant aid methods will be introduced as are required to serve the large number of refugees and emigrants that assemble at this port. Among other plans, the Unit will establish recreational arrangements for the refugees and emigrants. The lodging situation and hygienic provisions will be carefully surveyed in co-operation with the community and the steamship companies. It is felt that the social service methods introduced at Rotterdam will eventually be introduced into other European port cities through the initiative of Jewish women's organizations. Mrs. Alexander Kohut of New York City, chairman of the Committee on Reconstruction, announced that the Unit would devote six months to its labors and also that Mrs. Margaret Paukner had been assigned in March to the Joint Distribution Committee.

Council Aids Relief Appeal

Mrs. Alexander Kohut, who recently studied the European stiuation on an extensive tour that included many countries, is also addressing large audiences of men and women to assure the sucess of New York's appeal for $5,000,000. The Council is, in this way, placing the results of its European work at the disposal of the American Jewish Relief Committee.

Prior to her departure for Europe, Miss Elinor Sachs, Secretary of Foreign Work, Council of Jewish Women, addressed many organizations in New York city in the interest of the local war relief appeal. Miss Sachs presented stirring accounts of European conditions, observed during her association with the Council's Reconstruction Unit.

Other National Officers who are actime in the appeal include: Miss Rose Brenner, President; Mrs. Harry Sternberger, Executive Secretary; Mrs. Clarence E. Mack, Director; Miss Florina Lasker and Miss Cecelia Razovsky of the Department of Immigrant Aid.

Council Established in Italy

Another European country has established a Council of Jewish Women, under the inspiration of the American organization. The most recent one to be established is at Trieste, Italy, under the direction of Miss Elinor Sachs. European Councils of Jewish Women are now to be found in Holland, Belgium, Switzerland, Poland, Latvia and Italy. All will send representatives to the approaching American-European Conference of Jewish Women, to be held at Vienna, on May 6 to 13, upon the call of the American Council of Jewish Women.

The Council in Europe

By ELINOR SACHS-BARR

Secretary of Foreign Work, Council of Jewish Women

Mrs. Elinor Sachs-Barr

THE work of the Council of Jewish Women in Europe is a logical extension of its service to the immigrants in America. It was very clear that help to the immigrant, to be truly effective, must begin before he had reached the shores of America, while he was still in Europe. The restrictive American immigration law, the conditions in Eastern Europe which drove thousands to port cities in the hope of securing passage to America, intensified the need for the organizing of facilities to assist emigrants from Europe, especially for women and girls.

Accordingly, in the Spring of 1921, a unit of workers was sent to Europe for this purpose. Beginning in the ports of Rotterdam and Amsterdam, the work spread eastward, as the need demanded, to the borders of Russia. And in September of this year a Council of Jewish Women was organized in Riga to assist the hundreds of Russian emigrants who were fleeing from the Ukraine.

The immigrant of America is, in a sense, a concrete symbol of the close bond between Europe and America. Bearer of the traditions of Europe, he adds to his personality the new ideals of America: in him America and Europe meet. The organization of the Councils of Jewish Women in various cities of Europe has given form and definite recognition to this bond. Through the medium of the emigrant a close and intimate cooperation has been established between American and European Jewish women.

The members of the first Reconstruction Unit included Mrs. Celia Strakosch, of the Emanu-el Sisterhood of Personal Service, New York City; Miss Elinor Sachs and Miss Clara Greenhut, of New York City. It did not limit its work to that of study and observation at port cities on its own initiative. It also conferred with leaders of existing European organizations and exchanged views with European social workers, through lectures presented before classes in social workers' schools.

The Council's Reconstruction Unit

This Unit sailed for Europe in April, 1921, and carried on the pioneer work of the Council's Reconstruction Program.

[Elinor Sachs-Barr, the writer of this article, went abroad with the first Reconstruction Unit of the Council in April, 1921. Since 1922, she has been serving as Secretary of Foreign Work of the Council of Jewish Women. Working in cooperation with our Committee on Reconstruction and Foreign Relations, she directed all European arrangements for the approaching Vienna Conference and conferred with many prominent women of various countries in promoting the Conference Program.—*Editor.*]

1923 May 18

The Council of Jewish Women Becomes a World Force

BY ESTELLE M. STERNBERGER,

Executive Secretary, Council of Jewish Women

(Written Specially for Wisconsin Jewish Chronicle)

Since its inception, the Council of Jewish women has been the counsellor and companion of the immigrant. The very moment that an immigrant mother or girl sets her foot on the steamer bound for a new shore, bulletins gave her the assuring knowledge that a representative of the Council of Jewish Women would be awaiting her at Ellis Island. It meant that, in the event of any difficulty, she would not be alone and friendless. She would be aided in

MISS ROSE BRENNER, Brooklyn
President, C. J. W.

solving her problems, by those who had often solved them for other immigrants.

The Immigrants Plight in Europe

The Council of Jewish Women has not been content to wait until the immigrant reached American shores. There have recently arisen so many distressing and difficult situations that the Council has found it imperative to begin its work in Europe. Accordingly in the spring of 1921, a Council Unit of four women was sent abroad. Europe was so torn from its world war, that it required the sustaining strength of some body or organization to restore a service that it had once rendered. Refugees, by the thousands, were pouring from one country into another, their needs for sympathy and counsel unmet. Their eyes were turned to shores that spelt promise for hundreds of thousands of unfortunates. They were surging toward the cities of Western Europe, which they regarded as the gates of hope, that opened the roads of freedom, the steamship lanes to the land of America.

ESTELLE M. STERNBERGER, N.Y.
Executive Sec'y, C. J. W.

Reconstruction Work of Council Unit

It was with and for these refugees that the Council Unit labored. Steamship companies and community leaders in Holland and Belgium were met in successive conferences. Out of them resulted a group of European Council organizations, who undertook to render the refugee and immigrant service like that of the Council of Jewish Women in the instruction and recreation were instituted, by the members of the Unit, to initiate the educational and social welfare programs of these Councils. The ablest women of these splendid Jewish communities responded to the call for leaders to guide this work. As a result of this work, European Councils of Jewish Women are now to be found in Antwerp, Belgium; Paris, France; Amsterdam, Rotterdam and The Hague, Holland; Lodz, Poland; Geneva, Switzerland; Riga, Latvia; and Trieste, Italy.

European Conference Crowns Foreign Work

The crowning achievement of all these efforts abroad, has just occurred. The Council of Jewish Women invited the Jewish women's organizations of Europe and America to meet in a conference in Vienna, May 6th to 11th. This conference discussed the problems affecting the transmigrant woman and child; the need for educational and religious work in communities that lack institutions and organizations for this communal service; and the possibilities of co-operation on the part of Jewish women's organizations in Europe and America in solving these problems and meeting these needs.

Reconstruction Unit, C. J. W.

The delegation of the Council of Jewish Women included the following: Mrs. Alexander Kohut of New York City, Chairman of the Committee on Reconstruction; Mrs. Nathaniel E. Harris of Bradford, Pa., Chairman of the Committee on Foreign Relations; Mrs. Harry Sternberger of New York City, Executive Secretary of the Council of Jewish Women, and Miss Cecilia Razovsky, of the National Department of Immigrant Aid, Council of Jewish Women. Mrs. Elinor Sachs-Barr, of New York City, who has been serving as Secretary of Foreign Work directed European arrangements for the Conference at Vienna.

Emigrants Informed of American Immigration Laws

With the enactment of the recent Percentage Law governing the admission of immigrants into the United States, the Council of Jewish Women has been called upon to inform emigrants of the provisions of the law. Through the Council Unit in Europe, the Council of Jewish Women has been able to keep emigrants informed of the changes in the law, and to advise them as to the best course to pursue.

The Council and the Immigrant Problem

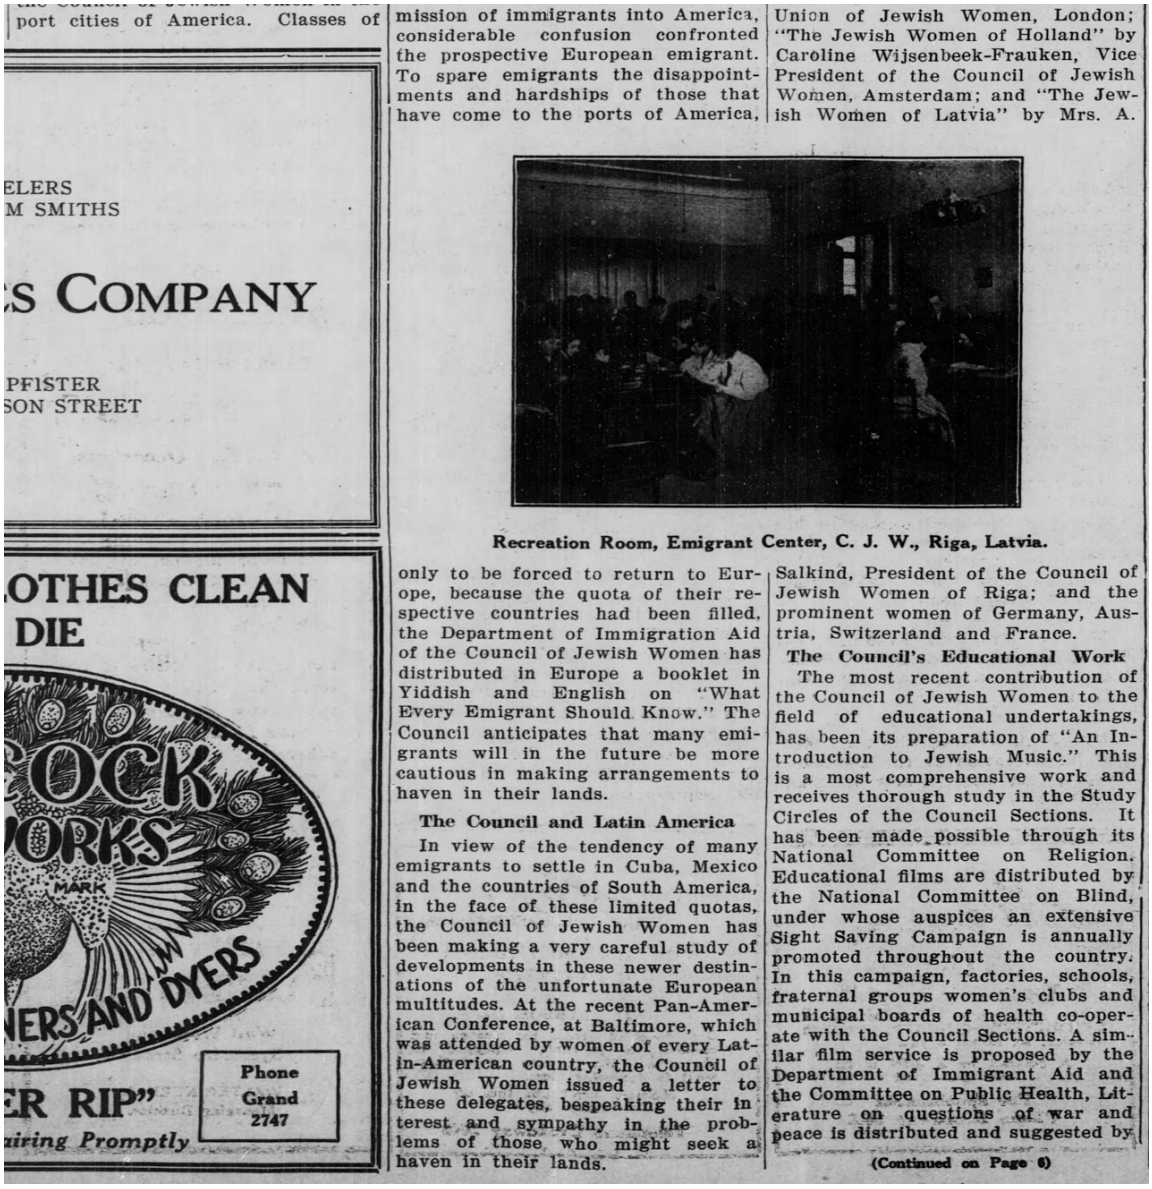
Moreover, to encourage thoughtful discussion and consideration of the immigrant problem, the Department of Immigration Aid of the Council of Jewish Women issues a periodical, "The Immigrant." Women of the Council, its national officers and more local leaders, authorities on the immigration question and observers, contribute to its columns.

The Council and the Woman in Rural Communities

An increasing number of Jewish women are now resident in the rural communities. The farmers have often appealed directly to the Council of Jewish Women to extend its work to their communities, to guide the women in a program that would afford them newer visions and increased opportunities for useful service and effort. Every essential feature of rural activity and interest has been introduced through a national Committee on Work Among Women on Farms. This national rural committee functions through state chairmen; field representatives who come in direct contact with every rural family; and local organizations that have been affected by it. Active work among our women in rural communities, is now being promoted in the states of Massachusetts, Connecticut, New York, New Jersey and Pennsylvania. These local organizations carry on every possible phase of the Council's program of religious, educational, social welfare and civic work.

The Council Establishes a Woman's Literary Medium

Through "The Jewish Woman," the official quarterly of the Council of Jewish Women, the Jewish women of the world have been afforded a new medium for the expression of their ideas. Its columns have contained contributions from the women of Europe, as well as from the American woman. An interchange of thought has resulted that will, eventually, lead to a better understanding of the problems and aspirations of Jewish womanhood everywhere. It it a journal of world news, and thought that will offer posterity a better appreciation of the status and achievements of women in our generation. In its columns have already appeared such articles as "The Jewish Women of England" by Gertrude Spielman Chairman of the



port cities of America. Classes of

mission of immigrants into America, considerable confusion confronted the prospective European emigrant. To spare emigrants the disappointments and hardships of those that have come to the ports of America, only to be forced to return to Europe, because the quota of their respective countries had been filled, the Department of Immigration Aid of the Council of Jewish Women has distributed in Europe a booklet in Yiddish and English on "What Every Emigrant Should Know." The Council anticipates that many emigrants will in the future be more cautious in making arrangements to haven in their lands.

The Council and Latin America

In view of the tendency of many emigrants to settle in Cuba, Mexico and the countries of South America, in the face of these limited quotas, the Council of Jewish Women has been making a very careful study of developments in these newer destinations of the unfortunate European multitudes. At the recent Pan-American Conference, at Baltimore, which was attended by women of every Latin-American country, the Council of Jewish Women issued a letter to these delegates, bespeaking their interest and sympathy in the problems of those who might seek a haven in their lands.

Union of Jewish Women, London; "The Jewish Women of Holland" by Caroline Wijsenbeek-Frauken, Vice President of the Council of Jewish Women, Amsterdam; and "The Jewish Women of Latvia" by Mrs. A. Salkind, President of the Council of Jewish Women of Riga; and the prominent women of Germany, Austria, Switzerland and France.

Recreation Room, Emigrant Center, C. J. W., Riga, Latvia.

The Council's Educational Work

The most recent contribution of the Council of Jewish Women to the field of educational undertakings, has been its preparation of "An Introduction to Jewish Music." This is a most comprehensive work and receives thorough study in the Study Circles of the Council Sections. It has been made possible through its National Committee on Religion. Educational films are distributed by the National Committee on Blind, under whose auspices an extensive Sight Saving Campaign is annually promoted throughout the country. In this campaign, factories, schools, fraternal groups women's clubs and municipal boards of health co-operate with the Council Sections. A similar film service is proposed by the Department of Immigrant Aid and the Committee on Public Health, Literature on questions of war and peace is distributed and suggested by

Radburn

Long Island Club of Dramatists to Show Production

Play Will Be Presented Here Next Wednesday Evening

Arrangements have been made through Mrs. Helen Kelinfeld, secretary of the Sunnyside Dramatic club at Sunnyside, L. I., to have the Sunnyside players perform at the next meeting of the Radburn Dramatic club, to be held in the Plaza building next Wednesday evening.

They will present a comedy, which was one of the plays used in their recent public performances at Sunnyside, entitled "You Wouldn't Fool Me, Would You?" The characters are taken in the play by David Barr, Elinor Barr and Maurice Frey. Mr. Frey is also the coach of the production.

Everybody in Radburn is cordially invited to attend this meeting, and it promises to be a very entertaining evening.

The guests will dine at the Dutch House before the play is given, with Mr. Crane and other members of the Dramatic club here.

Dr. W. E. B. DuBois,
Natl. Assn. for the Advancement
of Colored People,
New York City

My dear Dr. DuBois:

We beg to notify you that we are sending out the enclosed cover letter and questionnaire to a number of business concerns.

The work is outlined to proceed during the summer; but unless an emergency arises no meetings of the Committee will be called until the Fall.

Very sincerely yours,
Elinor Sachs Barr

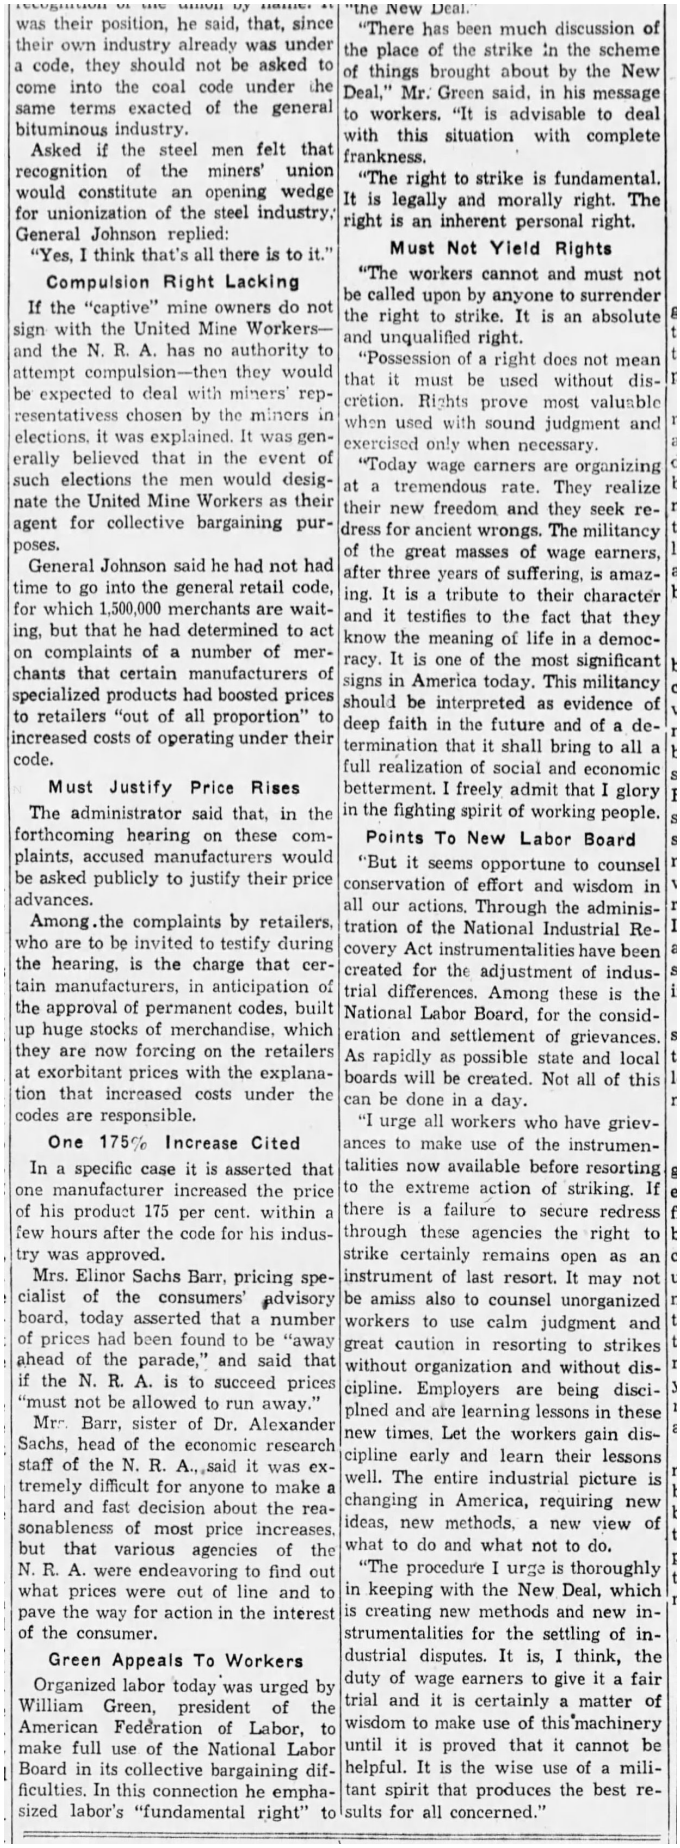
Johnson Hopes For Accord In Dispute Over Coal Code

Holds Conference With Steel Magnates And Labor Leader Over Recognition Of Union By Captive Mines

By DEWEY L. FLEMING

(*Continued from Page 1*)

United Mine Worker contract, but to be unalterably opposed to outright recognition of the union by name. It strike and said the procedure he was recommending was in keeping with



recognition of the union by name. It was their position, he said, that, since their own industry already was under a code, they should not be asked to come into the coal code under the same terms exacted of the general bituminous industry.

Asked if the steel men felt that recognition of the miners' union would constitute an opening wedge for unionization of the steel industry, General Johnson replied:

"Yes, I think that's all there is to it."

Compulsion Right Lacking

If the "captive" mine owners do not sign with the United Mine Workers—and the N. R. A. has no authority to attempt compulsion—then they would be expected to deal with miners' representativess chosen by the miners in elections, it was explained. It was generally believed that in the event of such elections the men would designate the United Mine Workers as their agent for collective bargaining purposes.

General Johnson said he had not had time to go into the general retail code, for which 1,500,000 merchants are waiting, but that he had determined to act on complaints of a number of merchants that certain manufacturers of specialized products had boosted prices to retailers "out of all proportion" to increased costs of operating under their code.

Must Justify Price Rises

The administrator said that, in the forthcoming hearing on these complaints, accused manufacturers would be asked publicly to justify their price advances.

Among the complaints by retailers, who are to be invited to testify during the hearing, is the charge that certain manufacturers, in anticipation of the approval of permanent codes, built up huge stocks of merchandise, which they are now forcing on the retailers at exorbitant prices with the explanation that increased costs under the codes are responsible.

One 175% Increase Cited

In a specific case it is asserted that one manufacturer increased the price of his product 175 per cent. within a few hours after the code for his industry was approved.

Mrs. Elinor Sachs Barr, pricing specialist of the consumers' advisory board, today asserted that a number of prices had been found to be "away ahead of the parade," and said that if the N. R. A. is to succeed prices "must not be allowed to run away."

Mrs. Barr, sister of Dr. Alexander Sachs, head of the economic research staff of the N. R. A., said it was extremely difficult for anyone to make a hard and fast decision about the reasonableness of most price increases, but that various agencies of the N. R. A. were endeavoring to find out what prices were out of line and to pave the way for action in the interest of the consumer.

Green Appeals To Workers

Organized labor today was urged by William Green, president of the American Federation of Labor, to make full use of the National Labor Board in its collective bargaining difficulties. In this connection he emphasized labor's "fundamental right" to

"the New Deal."

"There has been much discussion of the place of the strike in the scheme of things brought about by the New Deal," Mr. Green said, in his message to workers. "It is advisable to deal with this situation with complete frankness.

"The right to strike is fundamental. It is legally and morally right. The right is an inherent personal right.

Must Not Yield Rights

"The workers cannot and must not be called upon by anyone to surrender the right to strike. It is an absolute and unqualified right.

"Possession of a right does not mean that it must be used without discretion. Rights prove most valuable when used with sound judgment and exercised only when necessary.

"Today wage earners are organizing at a tremendous rate. They realize their new freedom and they seek redress for ancient wrongs. The militancy of the great masses of wage earners, after three years of suffering, is amazing. It is a tribute to their character and it testifies to the fact that they know the meaning of life in a democracy. It is one of the most significant signs in America today. This militancy should be interpreted as evidence of deep faith in the future and of a determination that it shall bring to all a full realization of social and economic betterment. I freely admit that I glory in the fighting spirit of working people.

Points To New Labor Board

"But it seems opportune to counsel conservation of effort and wisdom in all our actions. Through the administration of the National Industrial Recovery Act instrumentalities have been created for the adjustment of industrial differences. Among these is the National Labor Board, for the consideration and settlement of grievances. As rapidly as possible state and local boards will be created. Not all of this can be done in a day.

"I urge all workers who have grievances to make use of the instrumentalities now available before resorting to the extreme action of striking. If there is a failure to secure redress through these agencies the right to strike certainly remains open as an instrument of last resort. It may not be amiss also to counsel unorganized workers to use calm judgment and great caution in resorting to strikes without organization and without discipline. Employers are being disciplned and are learning lessons in these new times. Let the workers gain discipline early and learn their lessons well. The entire industrial picture is changing in America, requiring new ideas, new methods, a new view of what to do and what not to do.

"The procedure I urge is thoroughly in keeping with the New Deal, which is creating new methods and new instrumentalities for the settling of industrial disputes. It is, I think, the duty of wage earners to give it a fair trial and it is certainly a matter of wisdom to make use of this machinery until it is proved that it cannot be helpful. It is the wise use of a militant spirit that produces the best results for all concerned."

Consumers Are Asking Why Prices Continually Mount

By ELINOR SACHS BARR

(Pricing Specialist, Consumers Advisory Board)

If the NRA is to succeed, prices must not be allowed to run away. In the words of President Roosevelt: "We cannot hope for full effect of this plan unless, in these first critical months, and even at the expense of full initial profits, we defer price increases as long as possible."

What is actually happening?

Judging by newspaper comment and letters to the consumers' advisory board, some prices are marching away ahead of the parade. And there is every expectation of further jumps.

How is the consumer to pass intelligently on the problem? Why have prices risen? How much? Are these rises in prices justified?

It is an easy matter to keep currently informed on the situation in the retail trade. A visit to the store any will show the purchaser increases in one or the other item. But it is much more difficult to judge the validity of the price increases.

The intelligent consumer tries to figure out why the bed sheets for which she paid 60 cents a piece in March this year were $1.19 when she went to the same store in September. "That's almost twice as much," she said, indignantly. "I won't buy any sheets now." The salesperson telis her politely but firmly that if she waits until the winter months, she will have to pay much more. She finds an even larger increase when she is about to buy percale for her children's clothes. In March she paid 8 cents a yard; in September, when she was making their school clothes, she had to pay 22 cents.

Not Easily Answered

Perplexed, she returns home to "figure it out." Her percale cost her 175 percent more than she paid in March; her sheets cost 72 percent more.

It is true that with the exception of the previous year, she never paid so little for that particular sheet as in March of this year. Why were sheets so cheap then? Is it just a desire to profiteer that makes the retailer charge so much more now? Who is doing the profiteering? Is there really profiteering? Or, are the increases justifiable under the circumstances? What are these "circumstances?"

These and many more questions come to the mind of the intelligent consumer who tries to find the reasons for the increased cost of articles of daily use in the household.

With the aid of the consumers' advisory board this consumer has made an attempt to evaluate the factors that enter into the increased price. She finds at the outset that her questions are not easily answered.

The retailer gets his percale from a wholesaler or jobber, who gets the goods from the converter. The converter, who probably bought direct from the mill, has had the goods printed by the finisher. In a manufactured article, a dress, for example, there is a still more bewildering progression of steps from the mill which wove the gray goods to the retail store.

What did it cost the mill to manufacture the yard of percale she has bought? How much did it cost to print it in its present design? What does the wholesaler charge for his services? What did the retailer pay? What were these costs in March and what are these costs now?

Two distinct increases in the cost have been effected recently. One is a government tax; the other is increased wages and shorter hours.

Taxes and Wages Increase

Under the Agricultural Adjustment Act, a processing tax of 4.2 cents is imposed on every pound of cotton. The greater the cotton content of the article she buys, the larger is the proportionate amount of the tax. Consequently, the $1 cotton house dress she wears on her round of home duties in the morning bears a larger tax than the light voile dress she slips on to go to the store. This tax on cotton is designed to help the farmer, to whom the government will make substantial benefit payments this year. She is, of course, in sympathy with any attempt to increase the income and purchasing power of the farmer.

The second increase arises from the national recovery act's aim to increase wages to labor and shorten hours. Thus again the government is making an effort to increase purchasing power, this time of the workers in trade and industry. The cotton textile industry was of the first to sign a code, on July 17. Hours of labor were reduced to 40 a week, with a two-shift operation; wages were raised to a minimum of $12 in the south and $13 in the north. The customer is in full accord with this effort to raise wages and spread employment. She realizes that the clothes offered last winter at such "extraordinary bargains" often meant sweatshop conditions and starvation wages to factory workers and salespeople. And it very often meant shoddy clothes.

Where Are Labor's Cost

But how much more should be added, or is added, to the price of the three yards of percale and the six sheets she bought? Where are the labor costs incurred? There is the mill which weaves the cloth. In the case of sheets, it usually does all the operations—weaves the gray cloth, bleaches, and hemstitches or sews the sheet. In case of cloth, the mill usually sells the gray goods to a converter, who contracts with the finisher to have the goods printed into patterns of his designing. The finisher dyes or bleaches or prints the cloth. Already there are two sources to which extra labor costs

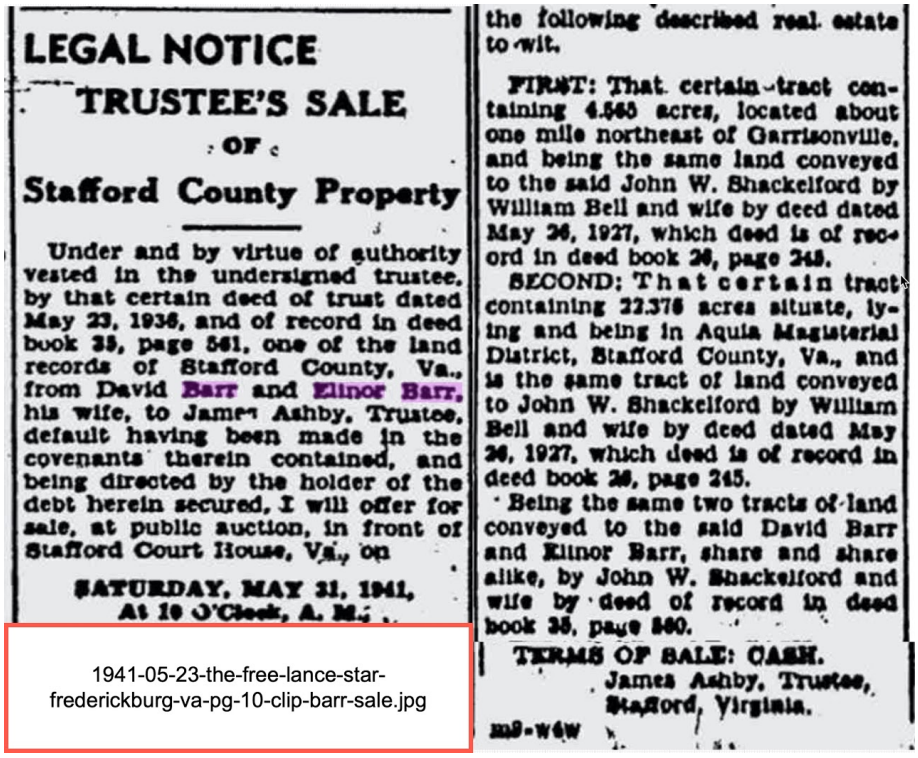
Property sale with husband David S Barr (born 1894) , of property in stafford country, Virginia.



LEGAL NOTICE

TRUSTEE'S SALE

OF

Stafford County Property

Under and by virtue of authority vested in the undersigned trustee, by that certain deed of trust dated May 23, 1936, and of record in deed book 35, page 561, one of the land records of Stafford County, Va., from David Barr and Elinor Barr, his wife, to James Ashby, Trustee, default having been made in the covenants therein contained, and being directed by the holder of the debt herein secured, I will offer for sale, at public auction, in front of Stafford Court House, Va., on

SATURDAY, MAY 31, 1941, At 10 O'Clock, A. M.,

the following described real estate to-wit.

FIRST: That certain tract containing 4.565 acres, located about one mile northeast of Garrisonville, and being the same land conveyed to the said John W. Shackelford by William Bell and wife by deed dated May 26, 1927, which deed is of record in deed book 26, page 243.

SECOND: That certain tract containing 22.376 acres situate, lying and being in Aquia Magisterial District, Stafford County, Va., and is the same tract of land conveyed to John W. Shackelford by William Bell and wife by deed dated May 26, 1927, which deed is of record in deed book 26, page 245.

Being the same two tracts of land conveyed to the said David Barr and Elinor Barr, share and share alike, by John W. Shackelford and wife by deed of record in deed book 35, page 560.

TERMS OF SALE: CASH.

James Ashby, Trustee,
Stafford, Virginia.

1948 - Daughter's wedding - Mrs. Winifred Barr to marry Jerome Rothenberg

Cousin of bride was **Mrs. Gloria Lurie** (as her only attendant ??? Where was the rest of the family?)

The New York Times

MONDAY, JULY 12, 1948

Rothenberg—Barr

The marriage of Miss Winifred Barr, daughter of Mrs. Elinor Sachs Barr of 415 Central Park West and of David Barr, also of this city, to Jerome Rothenberg, son of Mr. and Mrs. Gabriel Rothenberg of Brooklyn and of Danbury, Conn., took place last evening in the ballroom of the Delmonico. The Rev. Dr. Jerome Malino performed the ceremony.

The bride had her cousin, Miss Gloria Lurie, as her only attendant. Albert Rothenberg was his brother's best man.

The bride was graduated last year from Barnard College, where she was elected to Phi Beta Kappa. She is studying for a Master's degree at Columbia University. Mr. Rothenberg, an alumnus of Columbia College, received his Master's degree from Columbia last year and is working for a Ph. D. degree there. He also is a member of Phi Beta Kappa.

Strategy, Arms Control, and the Deployment of Defensive Weapons Systems

JEROME ROTHENBERG

MASSACHUSETTS INSTITUTE OF TECHNOLOGY

I. Introduction

The purpose of this paper is to examine the two-way relationship between the size and composition of military forces on the one hand, and appropriate military strategies for employing them (which includes not using them) on the other. The rationale of the whole work is that such a relationship does exist. Given the assumption of a certain degree of hostility or tension between two nations, one particular pair of force configurations will render certain strategies inappropriate for either or both parties, a different pair of configurations will make a different set of strategies inappropriate. Similarly, given certain strategies and initial force configurations, some decisions about future force configurations will be more appropriate than others. The terms "appropriate" and "inappropriate" are not meant to convey normative or even prudential weight. They denote agreement or lack of agreement with a system of certain implicitly assumed goals and a set of technical relations between alternatives means and ends. In other words, they refer to efficient and inefficient alternatives as presumably perceived by the participants.

The form of the investigation is to begin by characterizing the present nuclear confrontation between the U.S. and the Soviet Union. This provides a point of departure for considering a variety of hypothetical

NOTE: This study was supported by the Bendix Systems Division, the Bendix Corporation. Richard Cady of the Bendix Systems Division provided valuable assistance. But the author assumes full responsibility for the facts, analyses and opinions contained herein.

AN ALUMNA'S DAUGHTER wins a graduate fellowship—pretty special! Winifred Barr '47, who is the daughter of Elinor Sachs Barr '17, erstwhile director of the Associate Alumnae and at present a member of the Board of Editors of this magazine, has been named by the Faculty as the winner of the George Welwood Murray fellowship in the humanities and social sciences.

Lest we be accused of a tendency towards nepotism, let us also name for you the winners of the Rice fellowships in the natural sciences—Virginia Kanick, a physics major, and Eleanor Stephanie Zink, who has specialized in geology.

college gets money. T merly well-stocked she have since last June turn $2,600, with one quart we report at Commence member the name is marked Barnard.

Donald E. Barr (born 1921)

Wikipedia Donald Barr

[HB001Q][GDrive]

NOTE : "Donald Barr" is not the same person as "Donald Barr Chidsey" - No relationship exists!
Donald Barr Chidsey (born 1902) who lived nearby in New Jersey, was also an author, also had an intelligence background, but was born in 1902.

- **BORN :** August 08, 1921 ; Birthplace: **Manhattan**, New York,, United States [HL0024][GDrive]
- **DEATH :** February 05, 2004 (82) : Langhorne, Bucks County, Pennsylvania, United States [HL0024][GDrive]
- **PARENTS :** Father is **Simon Pelham Barr** (born 1892) / Mother is **Estelle de Young Barr** (born 1893) [HL0024][GDrive]
- **MARRIAGE :** Husband of Mary Margaret (Ahern) Barr
  - Not sure if the "Ahern" family is connected to the CIA officer and book author "Thomas L. Ahern Jr.) (https://www.historynet.com/book-review-vietnam-declassified-the-cia-and-counterinsurgency-by-thomas-l-ahern-jr.htm)
- **CHILDREN :** [HN00JO][GDrive]
  - Christopher J Barr (1947 - 2009) [HL0028][GDrive]
  - **William Pelham Barr (born 1950)**
  - Hilary Benedict Thomas Barr
  - Stephen M Barr
- **SIBLINGS :** Margaret Barr
- **OTHER FAMILY RELATIONSHIPS :**
  - Father's brother-in-law : **Alexander Sachs** (born 1892)

1930 Census - New York

Donald "E" Barr is 8 years old.

Full Census form : [HS0019][GDrive]

Father is **Simon Pelham Barr (born 1892)** , age 37. The census form says Simon was a "writer", working for "General Practice". He was born in England; his father and mother were born in Poland.

Mother is "**Estelle De Y**" (actually it is " **Estelle de Young Barr** (born 1893) ") , age 36. The census form says Estelle was born in New York; her father was born in Connecticut, and mother was born in Holland. Note that the census form says her career is "None", but we know that Estelle was working with Columbia University professionals in the 1920s and the 1930s, and that she was a doctor of psychology.

Their servant was **Paula Schubaur** (*spelling could be wrong*), who was born in Germany.

Their address was **450 Riverside Drive, in New York. City** .

	Street, avenue, road, etc.	House number (in cities or towns)	Number of dwelling house in order of visitation	Number of family in order of visitation	NAME of each person whose *place of abode* on April 1, 1930, was in this family	RELATION	Home owned or rented	Value of home, if owned, or monthly rental, if rented	Radio set	Does this family have a radio? 1934 - His father (and "New Dealer") Pelham Barr Appointed Divisional Director of the LBI (Library Binding Institute) - Remained Executive Director until 1947

See [HB0016][GDrive] :

When the New Deal organized American industry under the National Recovery A c t (NRA) in 1934, library bookbinders began a cooperative program to insure standards of quality and fair dealing that has continued for fifty years. Library bookbinding in 1934 was a considerably different affair than it is currently. A host of small shops dominated an industry with very few "giants" and no consistent definition of what it was that was being sold as "library binding." Individual binders dealt with individual librarians without the benefit of broader consultation about standards and prices for their services. Cost accounting varied tremendously across the indus- try, making pricing of bindery services exceedingly difficult. Wide variations in labor practices further destabilized a market already hard-hit by the Depression.

Barr is influential in creating LBI

Into this scene came the faceless federal bureaucracy of the NRA National Code Authority - with a difference in the person of Pelham Barr. Barr had started his professional life as a chemist, politically active and committed to the goals of the New Deal. With the inauguration of the NRA in February 1934, a Book Manufacturing Institute was established, and Barr was appointed Divisional Director for Library Binding.He immediately set about applying Code provisions for self-government, labor standards, and fair competition across the industry. By November of that year, Barr was planning to extend his duties to include promotional activities for the industry as a whole, undertaken at the expense of divisional member binders.

1941 - Graduates from Columbia University

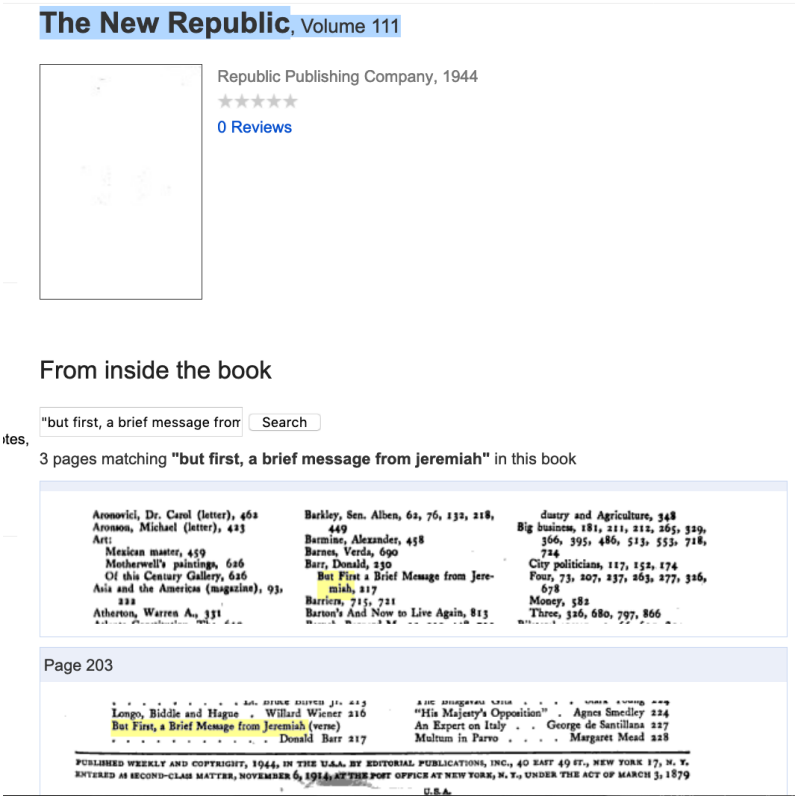
Donald Barr was in the class of 1941 at Columbia University, where he studied mathematics and 🔵**anthropology**. [HN00JU][GDrive]

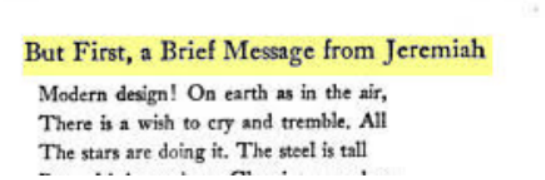
1942-1944 - With US Army in World War II

- [Donald Barr] "served with the U.S. Army as an Italian interpreter in a POW camp." [HN00JU][GDrive]
- During WW2, [Donald Barr] }taught higher math to anti-aircraft gunnery students at an Army camp in Hulen, Texas". [HN00JQ][GDrive]
- It was during his time with the army in WW2 that Donald Barr learned Italian. Donald Barr said *"I knew if I didnt make it, I'd be made a combat engineer in the South pacific where if I didnt get shot, I'd catch marlia or down. Boy, did I learn Italian."* [HN00K3][GDrive]

1944 - Donald Barr has first published poem : "But First, a Brief Message for Jeremiah"

The New Republic, Volume 111 : Republic Publishing Company, 1944





A full page view of this poem is not available in Google Books - Will post when one is available !

1945 - Joins Office of Strategic Service (OSS) in Germany

- In 1945, [Donald Barr] *"joined the Office of Strategic Services (OSS) in Germany, aiding in de-Nazifying companies and industry. He also investigated German industrialists and SS men who had fled to South America."* [HN00JQ][GDrive]
- The Office of Strategic Services (OSS) was the predecessor to the **Central Intelligence Agency (CIA)**. [HK0013][GDrive]
- In addition to working with the OSS Germany, it is documented that Donald Barr also served with the Office of Strategic Services in Washington DC.
- Some references describe this time differently. One source says that in 1945 Donald Barr joined the English department at Columbia and remained there for 10 years, taking an M.A. in English. [HN00JU][GDrive] Does this mean Donald Barr was only in Berlin for a few months? Or, does it mean that "aiding in de-Nazifying companies" is part of the job at Columbia University's English program?

Thus, it is not clear how long Donald Barr was with the OSS.

1946 (April 22) - Married Mary Margaret Ahern

Donald Barr marries at age 25. Marriage date here : [HB000Z][GDrive] . **Mary Maraget Ahern** was born in Connecticut on August 14, 1918. See [HL0029][GDrive] . Information on where this wedding took place is needed.

Mary Margaret (Ahern) Barr has been identified as a **Columbia University** professor / faculty member [HG001T][GDrive] . Details and additional verification is pending.

1947 - First son Christopher James born

See [HB000Z][GDrive]

1948 - Father (Simon Pelham Barr) passes

See **Simon Pelham Barr (born 1892)** .

1951 - Completes master's degree

[...] Donald Barr taught in the English department while getting his master's degree in 1951 and completing course requirements for a Ph.D. [By] then he was teaching courses with field work in sociology and political science at the School of Engineering and writing science and mathematics texts for elementary and junior high school students. [HN00JO][GDrive]

1955 - 1959

"In 1955 the engineering school asked him to oversee its efforts to spot promising elementary and secondary science students, including girls, and enlist them for advanced training at the school to help them rise to the college level. Joining the engineering dean's office, he then developed the Science Honors Program, which got the attention and support of the National Science Foundation." [HN00JO][GDrive]

In 1956 he moved to the school of engineering at Columbia University, where he became assistant dean and started and directed the science honors programs. [HN00JU][GDrive]

Mr. Barr became assistant dean of the Faculty of Engineering and Applied Science in 1959, and the foundation eventually asked him to administer its entire Cooperative College-School Program. He did so beginning in 1963, continuing until he became headmaster at Dalton the following year.

1958 (May26)

The Trouble With Science Education In the High Schools

By Donald Barr

(Mr. Barr is assistant to the dean of engineering at Columbia University and director of a program sponsored by the university in behalf of science education in high schools. The following are excerpts from an article in the quarterly Columbia University Forum.)

TO BEGIN WITH, there is a shortage of high-school teachers, especially in science and mathematics. When one asks high-school boys what careers they would like to follow, only a tiny fraction are interested in primary and secondary teaching—and most of these want to teach physical education. Why? Doubtless because teachers' salaries are too low. But they are not so low or so insecure in comparison with the material rewards of other rather popular careers—the law, for example, or "business administration." Doubtless also teachers are not respected by our society. Children absorb the values of their parents, and our popular culture does not value the intellectual. But children do not merely take over their parents' image of the teacher. They see the teacher in the classroom. And what they see is a man without authority.

The old-style teacher was an authoritarian figure. We have changed this, and probably it was wise and progressive to do so; but what children usually see now in front of the class is a manipulator anxiously trying to find some palatable psychological substitute for simple authority. The only authoritarian figure left in the modern school is the coach. This may explain why more boys want to teach physical education than all other subjects combined. Witness: it is not Society that has accomplished this; it is the educational system itself.

No More Rote and Rod

The real results of this change in teaching methods do not stop here, however. Authority is a simple device; the new pedagogy is subtle, complex, and shifting. It is no longer enough for a teacher to know the subject he teaches. It is far more important for him to know teaching methods. Almost every American community protects its children from the old barbarities of rote and rod by requiring its teachers to have had a substantial amount of course-work in methods and philosophies of education. It is not easy for a trained scientist or mathematician to get permission to teach science or mathematics in high school. Many have tried; few have been allowed to become more than teachers' understudies or irregular drudges, and often their frustration has been sharpened by watching mathematics and science classes turned over to music teachers or gym teachers. The solid, kindly power of the teachers colleges and the educational associations stands behind a teacher-certification system based on the psychology, not the content, of education.

Yet in some ways this system is realistic. The pupils who come up to high school at twelve or fourteen would be serious problems to the innocent scientist or engineer who did make his way into the classroom. These pupils have already undergone a long anti-intellectual indoctrination. There are two kinds of anti-intellectualism in American life, and more dangerous than the vulgar kind—which is a debased survival of the frontier spirit—is the intellectual anti-intellectualism which pervades modern elementary education. This view regards the brain as an organ which evolved by natural selection, like the neck of a giraffe or the nose of a dog. Its test of the healthy functioning of the brain is survival value; in other words, one is thinking well

when one's thoughts adapt one to the social environment. Ideas are thought of as "instruments," and the test of truth is experience. The more amiable the experience, the more truth it is supposd to contain. School should be a rich, rewarding experience. "Dry" subjects can be made fun by burying them in "real-life situations." If a subject cannot be learned through "real-life situations" at the youngsters' "experience-level" the youngsters are not ready for it. And so on, and so on.

Now, a good high-school mathematics teacher wants the child to understand highly abstract concepts, not merely to memorize and perform operations. This is a child, however, who has learned to read by a method which obliterates conceptual thinking. The first- or second-grade teacher, almost ignoring the rationale of phonics, has based her method on "word recognition"—that is, on recognizing arbitrarily presented associations between printed word and spoken word as if English were Chinese. She has put a premium on guesswork and the sensing of contexts. The child has developed no sense of close responsibility towards the printed page, and he has learned to see there (and everywhere else) what the "total situation" makes him expect to see. The satisfaction he has gotten from reading is the rich reward of having his expectations confirmed and his prejudices authorized, not the humble satisfaction of study. Growing a little older, this child has been encouraged to read "a sentence at a time." He has learned where to dart his eyes to "lift out the main ideas"—a thing which he can do in English because the meaning of an English clause depends on word order, so that the main elements come around according to a regular formula. This child has never learned Latin, because it is a dead language, so he has never encountered a language which, expressing relations by word-endings instead of by word order, must be read closely or not at all. He cannot read poetry or close reasoning.

He has, in fact, already learned to learn certain things and not others.

There was a time when children learned precision and ingenuity under the threat of corporal punishment. This method was based on the notion that intellection was worth the price in pain, and it demonstrated to the child that society put as high a value on intelligence as on deportment. The method was effective for the majority; but it produced bad habits in teachers, wrecked some of the best and most sensitive pupils, and brutalized the slower ones.

So the lash of competition was substituted. Dr. Johnson protested: "I would rather have the rod to be the general terrour of all, to make them learn, than tell a child, if you do thus, or thus, you will be more esteemed than your brothers or sisters. The rod produces an effect which terminates in itself. A child is afraid of being whipped, and gets his task, and there's an end on't; whereas, by exciting emulation and comparisons of superiority, you make brothers and sisters hate each other."

In time yet another method had to be substituted. The pupil was to be measured not against his fellows but against his own potentialities. But this is too subtle, too mysterious for a child to follow. In practice, the pupil loses his capacity to face being measured against any objective standards whatever. The result is that subjects where day-to-day success or failure is objective and clear-cut—subjects like mathematics—put an emotional strain on the pupil. These are the "hard" subjects, to be avoided. . . .

Some of the gravest problems that afflict high-school teaching of the sciences thus come not from general cultural configurations but from the very methods which devoted educators themselves have sold to the public.

What can be done about the schools? Of course teachers' salaries should be doubled. Of course Federal money should help build schools, including laboratory and library facilities. Industry should send exhibits and engineers to high schools to demonstrate the excitements of science. School boards should install training programs in which every elementary teacher already in the schools can learn how to take the natural sense of wonder a young child brings to school and develop it into exacting but still loving inquiry—that is, into science. There should be testing programs to discover the potentially gifted child as soon as possible; and teachers and guidance counselors should watch that child admiringly to discover where his best gifts tend; and he should be taught in a group of his intellectual peers, where he may be challenged; and he should be encouraged to go at his own best rate. Psychologists should conduct research into the psychology of gifts, into the early experiences that make the difference between the thing-minded child and the people-minded child. Instead of "accelerating" the bright child—putting him through the same old inadequate courses, but faster—schools should set up "enriched" programs for him.

Formula for Change

The old lockstep high-school curriculum, marching ill-assorted squads of children through "science" that consists only of obediently repeating the experiments of Lavoisier and Ohm, should go; and in its place there should be at least three curricula: a "science appreciation" course for those future voters who cannot do the mathematics on which modern science—and modern society—is based; a standard course for the standard student; and a course in real science—original or "open-ended" investigation—for the gifted..

Courses in "life adjustment"—driver safety, consumer education—should be reserved for those children whose innate abilities are such that they can do nothing with life but adjust to it. The three-option system, under which a child, with the help of his mother or his buddy, chooses a "college preparatory," a "business," or a "general" program, should go; the power to elect between mediocrity and hard work should not be given to fourteen-year-olds. Indeed, the whole intrusion of vocational training into high schools should be given a hard, cold look.

Columbia's Maverick Prof

G. K. Chesterton once wrote about a young man who, brought up by vegetarians, turned toward cannibalism. Maybe this explains the case of Donald Barr, maverick professor at Columbia university, who recently became a political district leader.

Barr is an avowed conservative Republican on . campus long dominated by liberal Democrats. A product of the university's educational system from kindergarten through graduate school, he has become a fighter for stiff academic standards and special programs for the gifted.

* * *

"In our equalitarian system," says Barr, "we've been too suspicious of bringing bright kids together. The great tradition in this country is to look after the weak. Commendable, enough. But equality of opportunity means that everyone gets the opportunity to do his best—and not just the average best."

At the age of 7, Barr was already challenging the progressive educationists. At Horace Mann elementary school, he stubbornly refused to print. He insisted on writing his exercises in script.

Later, at the Lincoln high school, while his classmates were taking pacifist oaths at mass meetings, young Barr was advocating the formation of an ROTC unit.

* * *

As an undergraduate at Columbia university, Barr was denounced as a "confused reactionary" by the student newspaper, The Spectator. Barr's editorial in the university's literary magazine had sided with the president of the university's stand against the Hitler-Stalin pact.

Now, as executive director of the university's joint program for technical education, Barr is developing a "science honors program." Each Saturday, students from public and private schools take courses and do research under the direction of the university's professors.

"This program shows people that bright children can and should go a lot faster than they do," he says.

At 38, Barr is not only educational expert and politician, but poet, literary critic, and a father of four. He is married to the former Mary Ahern of Hartford, Conn., who is teaching at Columbia now that their four boys are in school.

Barr's poetry and literary and educational articles have appeared in the Saturday Review, Harpers, the New York Times Book Review, and Commonweal.

* * *

Once, while a private in the army, Barr even infiltrated that organ of liberalism, the New Republic.

"It was just a poem," he says, "but rather a good conservative sonnet. It scanned and all. I'll bet I could take a good Barry Goldwaterism or a line from any Herbert Hoover speech and get it published as a poem in some liberal magazine. Let's face it," he adds impishly. "The majority of editors don't understand poems. In their heart of hearts, editors just don't believe that sonnets 'mean' anything."

* * *

To what does Barr owe his revolt from liberalism?

"To the messianic complex of my liberal colleagues," he replies. "When you get down to fundamental philosophical issues, there's always a point at which they won't follow you. All of a sudden you begin to notice a sort of pharisaical sneer. They don't listen to you any more. They diagnose you. They say, 'This man is morally sick. He is suffering from reactionary views just because you don't believe in this or that or the other. Liberals have certain basic beliefs in which they have invested their emotions.'"

* * *

Barr likes to list these beliefs in speeches before groups in the Seventh assembly district north, the college neighborhood in which he lives and is Republican district leader:

1. Liberals believe that anything taken over by the federal government is magically transformed into social justice, public welfare and virtue.

2. If you're a liberal, the other fellow is always a "sleazy politician," while you, the liberal, are always the "holy amateur."

3. Combinations of capital are automatically sinful while combinations of labor are automatically virtuous.

* * *

To combat these beliefs, Barr advises conservatives of whatever political party to "quit sulking and join your local political club."

"Liberals have falsely pictured the conservative man as a man who loves rich people and hates poor people," he says. "We conservatives must get out and tell the people what a conservative really is.

"He is a person who believes certain precious things ought to be preserved. The conservative believes that government intervention at any level should only begin when action by the individual citizen or private groups is unlikely or impractical."

Has Barr made any converts among intellectuals in his predominantly Democratic district?

"I think the liberals are beginning to find themselves increasingly incapable of infallibility," he says with scholarly understatement.

luggage and pulls out a bottle of Italian red wine. Fermi sends for paper cups. The members of the team hold their cups up — "Here's to the Atomic Age!"

A Little Extra Work

Let us go back four years. It is the evening of January 25, 1939, a cold, blowy evening in New York City. In a small, messy room in a basement at Columbia University, three men are working late.

For young Professor Dunning, it has been a busy day, and there is a lot more to do. He had lunch today with his friend Professor Fermi, who told him some exciting news. The news came in a roundabout way, from Berlin, Germany.

Things are bad in Berlin. The madman Hitler is running Germany and Austria, and he is having thousands of people beaten or shot because he doesn't like their religion or their political beliefs or because they oppose the inhuman methods of the Nazis. Many Germans and Austrians are escaping to other countries. One Austrian woman, Dr. Lise Meitner, who is now in Denmark, is an important physicist.

Atomic power can also be used destructively.

LETTER FROM BERLIN

A few weeks ago she got a letter from Otto Hahn, a chemist who has stayed in Germany. He said he had been experimenting with some uranium and discovered a strange thing — some of it had turned into another metal entirely. He hardly dared think what that meant. As soon as she read this, Dr. Meitner saw what it meant. She talked it over with friends in Denmark. One was Niels Bohr, who is the world's greatest expert on atoms. And Bohr was just leaving for a visit to America.

A few days ago he arrived and told some American scientists he was going to give a report on this new discovery to a meeting in Washington, tomorrow, January 26. The news has been spreading fast. Fermi talked it over with Dunning at lunch today, and then left for Washington to attend the meeting.

Young John Dunning, too, sees what it means. He sees that if you really do to uranium what Otto Hahn says he did to uranium, little bits of stuff will shoot

READ, DICK, READ

How can we best teach our children to heed—and understand—the printed page?

By Donald Barr

THIS IS READING. By Frank G. Jennings. Teachers College, Columbia University. 196 pp. $4.25.
READING WITHOUT DICK AND JANE. By Arthur S. Trace jr. Regnery. 185 pp. $4.50.
FOX IN SOCKS: A Tongue Twister for Super Children. By Dr. Seuss. Illustrated. Random House. 62 pp. $1.95.

In the first chapter of his first novel, written 42 years before he became Prime Minister, Disraeli lightly sketches a "backward" boy who had been taught to read "on the new system, by a pictorial alphabet, and who persisted to the last . . . in spelling A-P-E—monkey, merely because over the word there was a monster munching an apple."

"And quite right in the child . . . ," growls the character who speaks for Disraeli. "*Pictorial* alphabet!—pictorial fool's head!"

And here is a description of how most American children are introduced to reading in 1965; it comes from a new book, *This Is Reading*, written by a respected educational entrepreneur and journalist, Frank G. Jennings, and published by Teachers College of Columbia University: ". . . a simple picture and a whole word of two or three letters, both well known to the child, both well within his daily spoken vocabulary. Word and picture are handled and talked about. The teacher writes the word, usually printing in large block letters and games are played with them. This process goes on until the child acquires about seventy-five words in a so-called sight vocabulary."

Passing over Mr. Jennings' spinster commas and orphan pronouns for the moment, let us consider the operative words in this passage: "picture," "whole word," "daily," and "games." What do they really mean?

First: "picture." Between 1826 and 1965, printing technology has improved wonderfully, and the pictures in schoolbooks have grown brighter and better, more copious—and more dominant. Even so, Disraeli could already perceive what "the new system" was: instead of seeing the written word, then translating letters into sounds, identifying the spoken word, and lastly considering what the spoken word might mean, the child was now invited to look at the written word, then look at pictures of the meaning of the written word, and lastly guess what spoken word might have about the same meaning. Thus meaning became a means, not the end, of reading.

Second: "whole word." When we ask a child to associate a whole printed word with a whole spoken word, we ask *(Continued on page 19)*

[HN00KF][GDrive]

Read, Dick, read

(Continued from page 1)

him *not* to think about the parts of the printed word (the letters) and the parts of the spoken word (the phonemes). We ask him to learn *by rote*—by purblind nasty old 18th-century rote!—that A-P-E stands for a certain pair of sounds. "Never mind why—it just does!" we say in effect; and we give the poor little devil an eye-catching picture of a primate to remind him, so that he will not be forced, as a mnemonic device, to puzzle out the connection between the letters and the sounds. Under this system, many children may never acquire the habit of responsible attention to the printed page—or to anything else.

Third: "daily." If we put off teaching the simple rules for translating letters into sounds, we can only make a child memorize the written equivalent of a rather small number of whole spoken words. What words are these to be? Why, clearly they should be useful, socially *central* words, daily words. So we begin the practice of "vocabulary control"—the deliberate restricting of the verbal experiences of a child for several years. We create a new kind of writing, a whole new rhetoric for children—not stories, not poems, not histories, not articles on science, but a series of demonstrative shrieks: "Look, Dick! See Jane run!' Look, Jane, look! See Spot! Run, Spot, run!" And we create a whole mythological America inhabited by scrubbed, friendly, *depersonalized* people and dogs. The unique emotional shallowness of this mythology may actually be a worse threat to some children's security than the bloody bumptiousness and malicious pathos of Grimm and Andersen.

Fourth: "games." If we are going to substitute memorizing for figuring out, and if we are going to control a child's reading vocabulary so that he cannot have access *on his own* to anything interesting in the way of stories, we are going to change the tone of the learning experience. Children are avid for mastery, for the sense of powerful insights. The "new system" withholds or defers the full joy of competence; instead of being thrilling in itself, learning to read has to be disguised and sweetened up with synthetic gaiety. As a result, some children may not make a good transition from habits of play—play is activity contained in the present—to habits of work—work is activity which reaches toward the future.

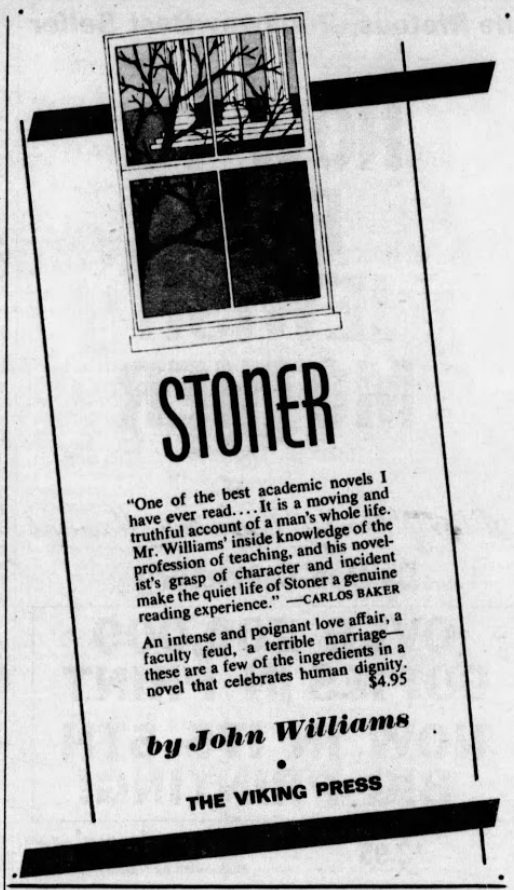
A hostile but carefully researched exposition of "the new system" and its consequences has now been written by Dr. Arthur S. Trace jr., whose previous book on education, *What Ivan Knows That Johnny Doesn't*, compared American curricula unfavorably with Russian and provoked in the school world a marvelous display of patriotism.

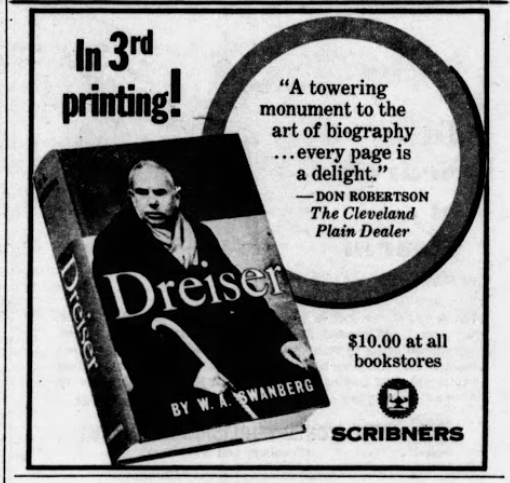
It is instructive to compare Professor Trace's *Reading Without Dick and Jane* with Mr. Jennings' *This is Reading:* the angry scholar arraying his damning quotations and statistics and saying precisely what he thinks with grim humor; the journalist cascading information and misinformation, panegyric and insult, with an airy disdain for syntax. In the Jennings book one comes across sentences like this: "Count Rutherford made electric sparks jump little gaps, as had Franklin long before him, but then the Italian, Tesla, made a veritable Jovian bolt, and his compatriot, Marconi, used to hurl words across the Atlantic." Does Mr. Jennings mean Rutherford, who was not a count and whose work was primarily with atomic structure, or Rumford, who was a count and whose great work was with the mechanical equivalent of heat, or perhaps Ruhmkorff? Tesla was Croatian, not Italian. Somehow blunders like this destroy whatever confidence one might have in Mr. Jennings as an expositor of the subtle and mooted notions of educational psychology; and of course one wonders, too, how his editors at Teachers College ever passed such errors.

Professor Trace's title and most of his anger come, of course, from the most famous of the "basal reader" series, a sequence of non-stories about two non-children named Dick and Jane. All literate people share Professor Trace's revulsion; even Mr. Jennings admits that such books "occasionally assault the child's intelligence with a story and idea content that would bore a five-year-old." (How that particular adverb got there one cannot even speculate.) A few serious and gifted writers have tried to do something better for American children. Some of them have submitted to the prevailing rubrics of vocabulary-control and rote repetition, doubtless convincing themselves that such constraints are really a fecundating challenge to the artist, like the rules of a Petrarchan sonnet. Others build theoretical commitments into stories and poems—they try to illustrate cutely the rules that associate sounds with letters, so that a child can puzzle out a little phonics for himself.

One of the most productive of this latter group is Dr. Seuss, who started several decades ago with the enchanting *And to Think That I Saw It on Mulberry Street*, a plain and wonderful child's tale, and has grown more and more didactic and less and less enchanting ever since. His new effort, *Fox in Socks*, lacks all charm. It is mere calisthenics. The phonic guile shows: "Slow Joe Crow sews/Knox in box now." It raises an important question: When we have an effective intellectual implement to give a child, why set up elaborate situations so that the child "finds" the implement, "discovers" that it *is* an implement, and "explores" its effects? If you have a door-key a child needs, why hand it to him buried in a boxful of hairpins, clips and coins? Why not say, "Here is a key"? Our schools are full of this counterfeit induction, part of the current mystique of discovery. There is a trickiness about it that at best is smarmy and at worst may contaminate a child's best pride with doubt.

Very young children are, of course, capable of genuine induction. Merely becoming aware of language is a brilliant achievement in abstract thought. Consider: there are two media through which we pass bits of intelligence to one another, Time and Space. Speech, like music, is organized in Time. One word follows another, and the word uttered is instantly gone—irretrievable except by an act of remembering. And yet the new infant, squirming in the bassinet without a concept in his head, perceives patterns in the welter of recurring noises, makes comparisons of sounds which have already sped into the silence of the past, and discovers the very existence of meaning. Pictures are organized in Space. All the parts of a notion are presented together; there is no set order in which they are seen, and therefore no true logic; but they do stay there to be scrutinized over and over, compared and contracted, thought about. Of all the expressions of intelligence, writing is uniquely organized in *both* Space and Time: we write and read in sequence and therefore with possible logic; but all the elements stay within the reach of scrutiny and thought; we can pause and we can skip, we can go back and forth repeatedly. This fact—that we take something which happens in time and record it faithfully in space, so that it exists in orderly permanence—is the whole secret of reading. The rules of translation are simple; they could be simpler if languages like English had no past or a poor disposable past; but they are simple enough. With these rules explicitly known—with competence and its healthy glory—the teaching of reading begins.





DAN WAKEFIELD, a forceful young social critic and journalist, author of "Island in the City" and "Revolt in the South", frequently comments on the contemporary scene for *BOOK WEEK*

School board called 'bungling, near-sighted' in scathing attack

Dr. Donald Barr of the U. S. ffice of Education has called igonier Valley School Board's efusal to send one of its science teachers to Brazil a whacking blow, not only to ie professional pride and sta- is of a teacher, but also to in- rnational relations with outh America!"

"Poor administration" and a "bung- g, near-sighted, small-town school strict" are among his other accusa- ons in a letter sent this week from arich, Switzerland to Dr. Mary Kin- y, secretary of the school board.

The letter was sent post-haste to e school board (with a copy to the cho) after Dr. Barr, formerly with e National Science Foundation, arned of the board's November de- sion to reject a leave of absence to rs. Maria L. Clark, science instruc- r at Ligonier Senior High, to train atin American science teachers in e new science courses developed in e U.S.

The board decided, upon the recom- endation of Superintendent John cCoy and Principal John McCutch- n, that it was not feasible to send rs. Clark during January because the unavailability of a suitable sub- tute and because of cost — Mrs. ark would receive her normal sal- y plus paying a substitute.

The National Science Foundation d asked the board further to pick one-third of Mrs. Clark's travel pense. This, however, was not re- red, only requested.

Mrs. Clark was one of five teach- in the county selected by Foundation to participate in the minar.

N HIS LETTER, Dr. Barr stated: t the American School in Zurich where I have just arrived, I found in a large stack of mail, which had accumulated since my departure from the U.S. in October, a letter from Mrs. Maria L. Clark (and also the Brazilian Embassy) that brings most unfortunate news.

"Mrs. Clark informs me that the Ligonier Valley School Board will not grant her a one-month leave of absence to train Latin American Science teachers in the new science course developed in the U.S. A whacking blow, I must say, not only to the professional pride and status of a teacher, but also to international relations with South America!

"LET ME BEGIN at the beginning: Following the Punta del Este Conference last summer, Sr. de Souza, Brazilian representative in the Department of Scientific Affairs of the O.A.S., had taken steps to improve his country's secondary science program as well as college and university courses.

"The O.A.S., Pan American Union and the U.S. Department of State put their heads together and asked the National Science Foundation to select top U.S. secondary teachers to be the instruments in this Latin American training program.

"After extensive investigation and screening, Mrs. Clark was selected with four other awardees. After the committee's interview with Mrs. Clark, we were sure she was the BEST the United States could offer for placement in Brazil.

"The applicants were judged on the basis of their competence in teaching, their ability in the English language and their personal qualifications. Mrs. Clark has an international reputation, not only as a writer, but also an educator. With listings in 'Who's Who, Contemporary Authors,' American Assn. of Physics Teachers and American Assn. for the Advancement of Science, Mrs. Clark remains as unpretentious as before she reached this hierarchy.

"In addition, Mrs. Clark is beautiful, brilliant and obedient to all disciplines.

"NOW LET ME interject some side thoughts about Ligonier, a town of international reputation — PGA tournament . . . Rolling Rock Races . . . year-round resort . . . a colony of cosmopolitan people. It is now evident that the public school system does nothing to contribute to Ligonier's fine reputation.

"Here would have been an opportunity to say to the world, 'Ligonier has a great educational system' (I have just checked records and find that Ligonier is not accredited by the Middle Atlantic States).

"Now let me tell you what NSF has done for your teachers. Since 1964, NSF has paid over $5,000 to Ligonier teachers for training to put better science programs in the Ligonier schools. Our aid to the state of Pennsylvania is over $1 million. Yet the Ligonier School Board will not invest $500 in one of their staff.

"'What kind of a school board will budget $300 to send Mrs. Clark to a Physics conference each January for four days, but will not provide $500 to allow her to further an international educational program for one month! (The salary does not go to Mrs. Clark — it is the salary for a substitute teacher. Mrs. Clark has an accumulated sick leave equal to twice that length of time. The one-third transportation is not necessary as stated in the Echo's news article).

NO SUBSTITUTE? Bah! Ligonier Valley, Latrobe and Greensburg have a rich concentration of scientific personnel that could be borrowed from industry (at no expense to the board).

"Or the board feels that one needs a number of credits in the use of a projector and the history of education for maximum classroom performance. Poor administration, I'd say.

"I have disclosed some facts and a few opinions here and have sent similar correspondence to the state and federal departments of education to inform them of the bungling and near-sightedness of a small town school district."

WHEN ASKED by the Echo about securing a substitute for Mrs. Clark, Superintendent McCoy said they could not find a suitable one in the Ligonier Valley and surrounding school districts and that he had asked Mrs. Clark to suggest possibilities from the University of Pittsburgh where she had some contacts. No other area colleges were contacted, said McCoy, because of the short time involved and the probable cost of that caliber instructor.

Mrs. Clark, who had no suggestions from Pitt, contended that finding a substitute was not her responsibility. And in a letter to the board president, dated Dec. 2, she said ". . . It is my opinion that the facets for obtaining a substitute have not been explored by the administration. Even Ligonier's science substitute, Mrs. Roland Tucker, was not called as a replacement for my January's absence. Industry and the science and education departments of local colleges and universities should have been called."

McCoy reported to the board Monday that Mrs. Tucker is not certificated as a science instructor and hence was not considered.

He told the Echo, further, that Mrs. Clark had been urged by both him and Mr. McCutcheon to come to both the November and December meetings of the school board to present her program in fuller detail, but Mrs. Clark failed to attend either meeting.

Full page : [HN00K8][GDrive]

Writer of scathing letter to school board reported fictitious

The writer of a scathing letter sent to the Ligonier Valley School Board is apparently fictitious, the Echo has learned from reliable sources. The letter appeared in full in the December 7 issue of the Echo.

The alleged writer, Dr. Donald T. Barr who claimed he was with the U. S. Office of education at the time of the writing, took the school board to task for refusing Mrs. Mary Lou Clark, former physics and chemistry teacher at Ligonier Senior High School, a month's leave of absence to teach science teachers in Brazil under provisions of a concocted National Science Foundation award.

The school board, at its January meeting, refused the request on the basis of cost (the board was asked to pay one-third of the transportation bill) and because no suitable substitute could be located on short notice.

The scathing letter from the alleged Dr. Barr dated November 29, 1967 and sent from Zurich, Switzerland, was one of three letters sent to school officials and Mrs. Clark on the leave of absence issue. The first two letters were sent respectively to John McCutcheon and Mrs. Clark, informing them of the teaching award which seemed to be coming from the National Science Foundation.

SPOKESMAN for both the U.S. Office of Education and the National Science Foundation told the Echo, however, that they have no Dr. Donald T. Barr on their staffs. The National Science Foundation, headquartered in Washington, D.C., said it did have a D.T. Barr hired as a consultant, but that he denied any knowledge of the three letters.

And, in a January 11 letter to John McCoy, superintendent of the Ligonier Valley Schools, Dr. Wilson, deputy director of NSF, said the whole event has been "misleading, giving bad publicity to both the school board and NSF."

He directed McCoy to inform McCutcheon, Dr. Mary Kinney, secretary of the school board to whom the third letter was sent; and the editor of the Ligonier Echo to whom a copy of the letter had been sent, of the alleged fictitious nature of the correspondence.

"All were apparent victims in the case," Dr. Wilson said.

Dr. Wilson explained further that the Foundation does not have such a teaching progam in Brazil and that Mrs. Clark had never been selected for the alleged award. The correspondence from the alleged Dr. Barr indicated that Mrs. Clark was one of five teachers in the entire United States selected to do the teaching in Brazil.

WHEN ASKED by the Echo if she had written the letters, Mrs. Clark, who resigned her teaching position on January 10, said that she did not, but refused to identify the actual writer.

The school board and administration have declined comment on the matter, saying that reasons for Mrs. Clark's resignation of January 10 "must come from her."

[HN00K9][GDrive]

1968 (March) - Lord harlech visits Dalton School, even chats with Headmaster Donald Barr

Full page : [HN00K6][GDrive]

It Happened Last Night

1968-03-06-the-scranton-tribune-pg-15-clip-last-night 2

—By EARL WILSON—

NEW YORK—The gossips who think Jackie Kennedy will marry Lord Harlech and become Lady Harlech have some new tidbits . . . Lord Harlech, who has children of school age, dropped in recently at the Dalton School, 108 E. 90th St., a few blocks from Mrs. Kennedy's 5th Ave. residence, and had a lengthy tete-a-tete with headmaster Donald Barr.

Some of the bright teenagers recognized Lord Harlech.

And they were especially curious because the headmaster cancelled a class that

"Lord Harlech was here," one of the Dalton School's lady officials told me. "But we have no application, he was just interested in visiting the school. We have a whole staff that shows visitors around. His visit was of no more importance than that."

"He just wanted to see the little old schoolhouse?" we asked.

"That's exactly what it was," the lady said.

Solution for Schools' Woes: More Discipline

By RALPH NOVAK

NEW YORK — (NEA) — In an era when prophets of educational doom are flourishing, just about everybody has some kind of revolutionary suggestion for saving the schools.

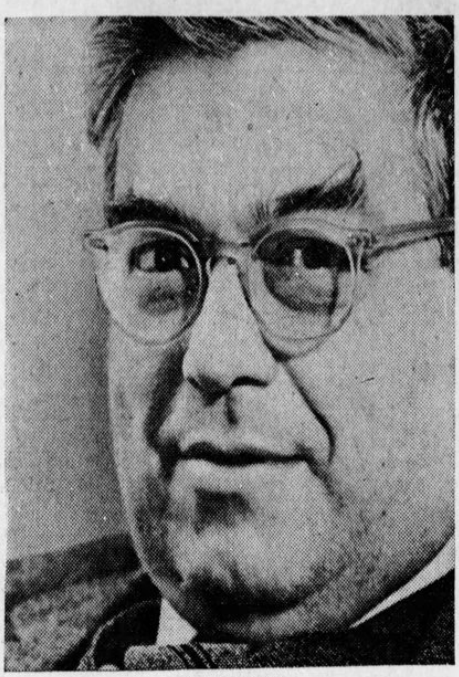
Donald Barr is one of them but he is also an exception. He is, politically and ideologically, a conservative and his solutions are conservative. One of his main tenets, in fact, is conservative enough to be radical these days: the need to restore old-fashioned discipline in schools.

"You have to set limits to what is permissible in school and those limits do not have to correspond with the Bill of Rights," says Barr, a former professor at Columbia University, former associate program director at the National Science Foundation and now headmaster of New York's highly regarded Dalton School, a bustling private school for youngsters 2 to 18. "A child must learn to follow the rules of the game in school or he will never be able to learn the rules of the next game he plays."

"Few of us like to think about discipline," he writes in "Who Pushed Humpty Dumpty?" (Atheneum), a new collection of his essays on education. "To the modern liberal mind, the word has an almost pornographic sound, but discipline is necessary to freedom.

Barr looks just the way benevolently despotic private school headmaster should look: big and bulky enough to be imposing, with eyes lively and friendly but capable of casting piercing looks, conversation witty and loose but uncompromising.

He agrees that today's schools are in a crisis, accusing them of "sedulously crushing the life out of marvelous little kids." But he places the blame on those "progressive educators" who have argued that the child can teach himself.



Donald Barr

"The trouble began when people began to think they could run schools on the basis of something other than the teacher's individual style and ability," he says. "Now teachers are flailing; they don't know what works any more. They're not the beasts some people make them out to be but they are demoralized and, too often, they're boring."

"The office of teacher deserves respect whether the teacher is good or bad, interesting or dull."

Barr does not romanticize the past, when teachers ruled their classes with a more or less iron hand. He just says the schools were better 30 years ago than they are now, in these days of what he calls "technological, sociological gizmos" and those who believe the child is supposed to bring himself up"

"The school is not an idyllic garden where the child can stay forever," he says. "It's a place where the potential adult in the child can emerge and the teacher has to be the symbol of what the child wants to become."

"The child who has never been controlled can never control himself. And there is no insecurity like being unable to control oneself."

Barr's theories on discipline run counter to the prevailing winds in education, which are blowing in the general direction of loosely structured schools (typified by the "open classroom" concept advocated by, among others, Charles Silberman, in his influential educational manifesto, "Crisis in the Classroom") but he argues that the public would support a return to tighter reins.

"The majority of people wants schools to be strict to teach respect for authority and promote good habits," he says. "Most people know that their children will have to face a world in which you have to show up on time for work and do what's assigned to you. People in the ghettoes know this better than anyone else. They are not only indifferent to educational experimentation; they're hostile to it."

Barr's idea of discipline, he says, "is not synonymous with fascism."

"The emphasis should be on growing freedom of choice, with the student having a bigger and bigger say in shaping his own education as he gets older," he contends. "Now we find people letting kids have self-destructive autonomy when they're younger and then trying to put their foot down when it's too late.

"Worse than being unable to succeed is being unable to fail. And the more parents show that they will pay their children's way no matter what, that they will approve of them no matter what, that they will deny them the right to fail, to suffer and to be ashamed—the more superfluous, the more angry and unreal these young people will feel."

Barr doesn't pretend that a return to stricter discipline would be any kind of elixir for America's troubled schools but he sees it as a step in the right direction.

"It can reinforce a child's conscience as regards work and personal moral character and help him cope gracefully with the demands of his own appetites and peer group pressures, which can be more despotic, masters than the worst teacher," he says. "Every once in a while you can stand between a kid and a situation into which he's being drawn by intolerable internal and external pressures and say 'no' and really help him. Then you've done something."

TALK WITH AN AUTHOR

'The Purpose of Discipline in Schools Is to Spur Discipline in Students'

By THOMAS HINE
Inquirer Education Writer

"All the king's horses and all the king's men couldn't put Humpty together again."

DONALD BARR, a shambling, slightly dishevelled admittedly portly but scarcely brittle or thin-shelled gentleman, has written a book entitled "Who Pushed Humpty Dumpty?: Dilemmas in American Education Today."

Sifting through the jagged remains of American education, the headmaster of New York's Dalton School finds two sets of villains — those who refuse to discipline children, and those who use statistics as a substitute for judgment, consecrating accountability at the expense of responsibility.

But who is finally responsible for Humpty Dumpty's great fall? Probably the king himself. All his horses and men can't do much about it.

"A school has to be a monarchical setup," Barr said during a recent visit to Philadelphia. "The administrator has to make personal responses. You can't process problems."

At Dalton, a first rate private school on New York's Upper East Side near Park Ave., a number of parents last year tried to depose Barr because of what they considered to be the illiberal nature of the school. But others, who admire his rigorous intellectual approach, defended him, and Barr continues to run his school with discipline and without standardized tests.

"Do you know why so many schools have gone in for things like the open classroom?" he asked, without waiting for an answer. "That way you don't know whether a school is botching. If my school is not teaching reading, I say 'That's not the enterprise, we're fearing down the walls.'

★ ★ ★

"You can work a kind of moral blackmail on rich parents, but you can't get away with it with the working class. The open classroom is appropriate for a heavily endowed child . . . if you want to produce a spoiled brat who will never do anything he doesn't want and will remain a spoiled brat until he dies."

—Donald Barr

★ ★ ★

"You can work that kind of moral blackmail on rich parents, but you can't get away with it with the working class. The open classroom is appropriate for a heavily endowed child. If you want to produce a spoiled brat who will never do anything he doesn't want and will remain a spoiled brat until he dies, surrounded by private nurses, that will do it."

Barr's belief in discipline and general conservatism is a reaction to a childhood spent in progressive schools and his youthful career as what he calls "an ultra-Marxist."

One important turning point came when he was in the Army during World War II and was sent to school to learn Italian. "I knew if I didn't make it, I'd be made a combat engineer in the South Pacific where if I didn't get shot, I'd catch malaria or drown. Boy, did I learn Italian."

In running the school, he tries to avoid mistakes that were made with him as a child.

"I was a very bright child, but I was lazy. I didn't want to be lazy. There was a little Donald who wanted to get to work, but the other little Donald got away with murder. Most children are bundles of contradictions.

"When we say we trust children, we throw them into the hands of that negative, refractory little Donald. You wouldn't put a bunch of kids on top of a cliff and trust them not to fall off. You put somebody there. But when you tell people they are being unfair to their children by letting them do as they please, they react with a horrible, smarmy piety, as if to say 'You rotten fascist.' "

Barr says the purpose of discipline is so that the student can develop self-discipline. "It's good when it helps work, bad when it substitutes for work. But a teacher can also substitute freedom for work. It's the same sleazy operation."

If there is one thing that incenses Barr more than the trend toward permissiveness, it is the push for accountability.

DONALD BARR

He abolished standardized tests at Dalton, and now he is appalled to see these tests emerge at the heart of a philosophy that threatens to take over the country's schools.

"Accountability implies you can measure performance. It means if you make predictions judge the human material that goes into a school. These are always self-fulfilling prophesies. There's something called the Rosenthal effect, which means if you make predictions at random, the students will turn out to behave as you predicted.

"The parent comes in and you say 'We're going to tell you that your kid is dumb so you can give up on him too.' There is no group test that gives a fair, culture-free rating of native ability. The whole result of accountability is a new Calvinism—a form of infant damnation."

Barr's aversion to standardized tests stems from the same sort of first-hand experience that shaped his feelings on progressive education. He was frequently asked to take such tests, when he was in school, to help set norms. As a result, he is an expert in taking them, and he does best in subjects he knows nothing about.

"The worst evil of such tests is that they are vulgarized. It is the thoughtful person who is penalized."

Like the other aspects of schooling at Dalton, escape from standardized tests can be enjoyed by only a privileged few. Parents of most of Barr's students are free to send their students to any sort of school they want.

"This is a luxury, but I believe that it should not be restricted to the rich. When parents can determine what kind of school they want their child to attend, there is instant accountability.

"There are drawbacks to a voucher plan (in which parents are given public money to pay for their children's education at a school of their choice) but I would rather risk them than to continue to play budget politics with people's lives. Nothing is quite as dreadful as the current game of shafting the other fellow's kid."

Local Teachers Given PSEA Posts

Two Abington Heights District teachers were re-elected to office in the Northeast Region, Pennsylvania State Education Association at a meeting recently at Pocono Manor.

Mrs. Louise Krafjack, a member of the elementary faculty at Newton-Ransom School, was elected to serve a second term as secretary and William Zeiss, Junior High School faculty member, was re-elected to his fourth term as chairman of the Resolutions Committee. He is also serving his sixth term as state chairman of that committee.

Both teachers will serve as cochairmen of the committee to elect Edward Smith to the office of president-elect of the state association. Mr. Smith, counselor at the junior high school, is currently serving as vice president of the Northeast Region. He received the endorsement of the membership of the region which numbers about 8,000 teachers, comprising eleven counties.

Peter Hackett, Montrose, presided at the meeting. The keynote address was presented by Donald Barr, headmaster of the Dalton school. Other Abington delegates included Leonard Vender, president of Abington Heights Education Association, and James Sohns.

1974 (Feb) - Barr Resigns from Dalton School (will remain until June 1974), Charging Trustees' Interference

See [HN00JX][GDrive]

Donald Barr, the controversial and outspoken headmaster of the Dalton School, one of the city's largest and most selective private schools, has resigned in protest of what he considers the trustee's interference with his leadership.

"Everyone knows that I am somewhat anachronistic in my views of the educational leadership of a school," Mr. Barr wrote in a letter yesterday to faculty members and parents. "I am not comfortable with the definition of board-head relations that I see becoming current in schools everywhere."

Mr. Barr's resignation, which the board says was not requested and not expected, comes after 10 frequently stormy years as head of Dalton, which is housed in an 11-story, brick building at 108 East 89th Street.

Question of Authority

The source of conflict between the strong-minded Mr. Barr and his 20-member board seemed to center on the question of where the board's authority should yield to the headmaster's judgment. There was apparently no one incident that prompted the resignation, but the confrontation was exacerbated by financial pressures that have forced the school to set priorities.

"The issue is the prerogatives of the board and the headmaster," said Richard Ravitch, a construction company executive who is president of the board. "My sense of trusteeship and my understanding of the requirements of the state law And the bylaws of the school all say to me that it is the obligation of the trustees of an institution to make all the policies."

Irony in the Resignation

Ironically, the present board of trustees includes many parents who rose to Mr. Barr's defense when a faction of the former board and some of the parents sought his ouster in 1971. He was accused then of turning a "humanistic, progressive" school into one in which "discipline and authoritarian rule" were the hallmarks.

The issues then had nothing to do with this issue now," Mr. Ravitch said. "All of us who are now officers of the board were supportive of him in that fight and supported his educational philosophy."

Mr. Barr ***said that he would remain until June 7*** *as headmaster of the coeducational school, which has grown rapidly under his leadership to an enrollment of 1,254 from prekindergarten through 12th*

The growing financial constraints that have come to bear on privately supported institutions are known to have heightened tensions between Mr. Barr and the board over the question of the extent to which cutbacks should be made among faculty and staff members.

Last month, Dalton dismissed several clerical and administrative employees and announced that more than a half dozen teaching positions would be eliminated next fall. Furthermore, an average increase of about $150 was announced in the tuition and fee schedule, which now ranges from $1,936 for pre-kinder-garteners to $3,126 for high school students.

"Certain things are essential and not to be touched, however you solve your problems," Mr. Barr said as he paced the floor of his cluttered office, his hands on his hips. "So far, I've patched together working solutions, but under economic stress I fear my differences with the board as to what's important are likely to show up more and more sharply."

An additional source of friction between Mr. Barr and the board seems to be the board's hiring of an outside committee to study the school and to assess its operation under Mr. Barr.

The first of the consultants, by coincidence, arrived yesterday and was in the headmaster's outer office as Mr. Barr was inside talking to reporter about his resignation.

Mr. Ravitch said yesterday that "everyone in the school was shocked and saddened" by the resignation and that it was possible that some board members might try to dissuade Mr. Barr from leaving.

Drama Develops In Dalton Schools

By MELVIN MADDOCKS

The Christian Science Monitor News Service, Copyright 1974

"Few pessimists become educators, but many educators become pessimists."

This dejected little aphorism — conjuring up clouds of stale chalkdust and the splat of a thousand spitballs — stands proven by the gloomy books devoted to the subject: "The Conspiracy Against Childhood," "Death at an Early Age," "Educational Wastelands," "Quackery in the Public Schools," "What They Are Doing to Your Children."

How lurid the melodramas promised by these titles!

Oliver Twist, it would seem, was blessed that he never fell into the hands of American school principals: he only got Fagin.

Lovers of rhetoric know that the inveighing against umpires grows more impassioned as a game goes on, reaching a fine hot - dog - mustard - smeared climax in the last of the ninth. According to the same general law, the high - dudgeon moment against American schools occurs in June.

It comes as little surprise, for instance, that a new chapter has just been written in education's answer to the soap opera, the Great Dalton School Massacre. As the temperature rose and teachers, students, and parents slowly wobbled into end - of - term hysteria, the very controversial headmaster of this very expensive New York private school, Donald Barr, was done in again. Or was he? Two pieces of paper fluttered like battle flags over still - disputed territory. One was Mr. Barr's resignation; one was a petition by Dalton parents that he be reappointed.

A twinkly man who looks (and writes) a bit like H.L. Mencken, Barr figures as one of those heroes whose ups and downs can be read as indicators of fads - in - flux in American education. In a business where "progressive" is still the approved designation, Barr has described himself as a reactionary — "that is, a conservative who is not cute." He came to Dalton in 1964 when conservative educators were in demand, briefly, after Sputnik. But Barr is a man of stubborn principles, and when the Sixties went onto the counterculture, he stayed put.

In fact, like a good reactionary, he reacted. In a sprightly book called "Who Pushed Humpty Dumpty?" he endorsed a forbidden word — "discipline." He was for Latin and against the "new" math! And he got personal.

Frowning over the "jaded children" he found in Dalton classrooms (and elsewhere), he complained: "We tend to withhold reality from them by behaving as if there were no such notion as earning thing. "

To the Dalton parents who burbled of their eight - year - old, "He's not our son; he's our friend," Barr responded: "The trouble with many parents is that the fathers are mothers and the mothers are sisters. . . Be an adult and enjoy being an adult. Do not permit what you do not soberly approve."

Since Dalton was founded in 1919 as the model of a "progressive" school, these Barrisms, stressing "competence" instead of "self-fulfillment," have mixed strangely with the setting, rather as if Barry Goldwater were the head of a commune.

Dalton children, characteristically, are the children of liberals — the David Susskinds, the Eli Wallachs, the Jules Feiffers. One parent called Barr "the Captain Queeg of Dalton," and during 10 years as headmaster, the Captain has come close to walking the plank at least once before, in 1970.

Now, curiously, Barr seems less dated than he did in 1970, or even in 1964. Like the counterculture, which hoped to transfer their classroom theories into life, the "progressives" have faded. The new radicals, like Ivan Illich, who calls or nothing less absolute than "deschooling," presumably mean to disenfranchise all the "progressive" Daltons as well as all the Little Red Schoolhouses.

newfangled ideal of education as "ecstasy," which allowed the books cited above such luxury of disparagement in their titles.

Education, Riesman suggests, is hung up between a past not quite dead and a future not yet born. The perfect time for lots more ideology, lots more rhetoric — lots more best - selling books with titles like "Who Put Your Child in the Black Hole of Calcutta?" Well, maybe not. Maybe the truer need during this interregnum is for caretakers who really care — "a minority," in Riesman's words, "who possess deep institutional loyalty and whose caring and sense of responsibility are moderately contagious."

If the description fits Barr, perhaps he ought to be cherished, whether he is a "progressive," "conservative," or a "reactionary."

If the Dalton board or any other overwrought trustees, teachers, parents, or students require an outlet during their steamy season, let them buy tickets for the bleachers at Shea Stadium and yell their lungs out. From that distance all Mets umpires look like headmasters anyway.

[HN00JW][GDrive]

1974 - Did Jeff Epstein meet Donald Barr at Dalton School ?

Did **Jeffrey Edward Epstein (born 1953)** meet Donald Barr at **Dalton School** ? The following is from [HN00KH][GDrive] :

- *"If Mr. Barr caught students using marijuana, he would often send them to therapy as a condition of staying in the school. He himself described his leadership style as "by ukase," using the Imperial Russian term for an edict from the czar."* Interesting ... Donald Barr used a "Russian" term!
- Jeff Epstein began teaching in September 1974, but Donald Barr was completed in June 1974.
- Jeff Epstein was only 21 years old when he started teaching, and did not have a degree.

See [HN00JX][GDrive] : In 1974 the Dalton School had an "enrollment of 1,254 from prekindergarten through 12th". As headmaster, it is probable that any new staff hires would have been met by Donald Barr, but it is possible Jeff Epstein did not interview with the school until summer 1974.

Mr. Epstein's time at Dalton was brief, and an administrator said it ended in a dismissal.

[....] The school, which had been a progressive haven for the children of artists and writers, was undergoing a shift under a new headmaster. Donald Barr, the father of Attorney General William Barr, came in as a disciplinarian focused on beefing up the academics of the school, and on enforcing a strict code of conduct.

In a school known for creativity, administrators had prohibited denim jeans and "bizarre and eccentric costumes." If Mr. Barr caught students using marijuana, he would often send them to therapy as a condition of staying in the school. He himself described his leadership style as "by ukase," using the Imperial Russian term for an edict from the czar.

[...] In February 1974, Mr. Barr had announced that he was resigning as headmaster, protesting the meddling by the board of trustees, but that he would stay on until the end of the school year. It is unclear whether Mr. Barr hired Mr. Epstein during that time.

Mr. Epstein, from Brooklyn, was just 21 when he joined the faculty at Dalton, arriving without a college degree. The school's student newspaper reported in September 1974 that he was starting that year as a math and physics teacher.

The next year [1975], he participated in a school musical for parents and faculty, and he appeared in later editions of the paper as the coach of the Dalton Tigers math team until the beginning of 1976.

The school had new leadership under Gardner Dunnan, who tentatively explored a rollback of some of its strict rules. Mr. Dunnan announced in early 1975 a policy that would allow denim inside the building, although students were still told to be neat and clean.

In the years since, however, Mr. Dunnan has faced allegations of his own inappropriate conduct. A former Dalton student said in a lawsuit that she had been invited to live with Mr. Dunnan at age 14, and had suffered repeated sexual assaults under his care. Mr. Dunnan denied the allegations. The lawsuit was dropped, but the woman's lawyer, Mariann Meier Wang, said she intended to refile it.

[...]

But Peter Branch, who was an interim headmaster after Mr. Barr and later the head of the high school, was not as fond of Mr. Epstein's teaching. He said that he did not recall anyone raising concerns to him about Mr. Epstein's conduct with students, but that he had heard concerns from the faculty about Mr. Epstein's teaching, and eventually determined that the teacher needed to go.

1974/1975 - Interesting insight on headmasters at Dalton School

See full page : [HN00KI][GDrive]

- **Dennis J. Phillips**, who was living in Glens Falls NY as of December 1974, was *"acting headmaster at the Dalton School in New York City [in 1974", before joining the law firm of "McPhillips, Fitzgerald & Meyer"*.
- Of note, the other person who joined the law firm at this time was **Joseph R. Brennan**, who was *"a member of the Federal Bureau of Investigation [, "FBI",] for three years and for three years he serve as an assistant United Stated attorney for the Northern District of New York."*

The Post-Star (Glens Falls, New York) · 31 Dec 1974, Tue · Page 10

Law Firm Changes Name

The Glens Falls law firm of McPhillips, Fitzgerald & Meyer has announced that Joseph R. Brennan has become a member and Dennis J. Phillips has become associated with the firm.

The firm also announced that effective Wednesday its name will change to McPhillips, Fitzgerald, Meyer & McLenithan.

Founded in 1911 by the late James McPhillips in association with the late C. E. Fitzgerald, the firm became McPhillips, Fitzgerald & McCarthy in May, 1931. The successor firm of McPhillips, Fitzgerald & Meyer was formed Jan. 1, 1961.

Brennan is a graduate of Mineville High School, Clarkson College and Albany Law School. He was a member of the Federal Bureau of Investigation for three years and for three years he served as an assistant United States attorney for the Northern District of New York. He became associated with the firm of McPhillips, Fitzgerald & Meyer in February, 1974.

Brennan resides in the Town of Queensbury with his wife, Faye, and their three daughters.

Phillips is a graduate of Lowville Academy and St. Lawrence University. A graduate of Fordham Law School, he received the degree of master of law in taxation and corporations from New York University. Before joining the firm, he was acting headmaster at the Dalton School in New York City.

Phillips and his wife, Patricia, reside in Glens Falls.

JOSEPH R. BRENNAN

DENNIS J. PHILLIPS

[HN00KJ][GDrive]

Additional info on **Dennis J. Phillips** can be found in his August 1974 wedding announcement in the NY Times (implying social/wealth status) ([HN00KK] [GDrive]) :

*"**Patricia Smith** Wed To Dennis Phillips : [...] Mrs. Phillips, who attended the University of Hawaii and the University of California at Los Angeles, graduated from Washington State College. She sang for two years with the Los Angeles Civic Light Opera before coming to New York to study at the Neighborhood Playhouse and the Manhattan School of Music. For the last four years she has been a teacher of English and director of the middle school drama program at the **Dalton School** , where her husband was formerly **director of admissions and college placement**. The bridegroom is with the law firm of McPhillips, Fitzgerald & Meyer in Glens Falls. [...]"*

Summary: The "acting headmaster at Dalton School" after Donald Barr was Dennis J. Phillips, and he was also formerly director of admissions and college placement. The odds of Dennis J. Phillips meeting a young Jeff Epstein are quite high.

1974 - Insight on Jeff Epstein and Dalton (from 2019 Daily Beast article)

See [HP001M][GDrive]

"Jeffrey Epstein graduated from Lafayette High School in 1969 at age 16, having skipped two grades. He was "chubby with curly hair and a high, 'hee-hee' kind of laugh," according to Filthy Rich. In the fall of 1969, Epstein started at Cooper Union and studied there for two years until the spring semester of 1971. Many writers say he attended New York University (NYU) after Cooper Union, but they rarely give specific dates. I decided to verify exactly when Epstein went to college and where. It turned out that Epstein was enrolled at NYU between September of 1971 and June of 1974. Thus, most of Epstein's college study years were spent at NYU. I verified that he did not graduate from NYU with their registrar."

[...]

"After the summer of 1974, Epstein began working as a teacher of mathematics and physics at the Dalton School in the Upper East Side of Manhattan. It has been reported that he began there in 1973, but this is incorrect. I searched the 1973-74 Dalton yearbook and there is no mention of Jeffrey Epstein. I then searched Dalton's school newspaper and found in the September 1974 issue that "... Mr. Epstein, who will also teach physics, [has] also joined the department this year." Epstein also confirmed that he taught there between 1974 and 1976 in a deposition."

[...]

"In 1974, Dalton was run by headmaster Donald Barr [...]. Writers have noted the interesting coincidence. However, Donald Barr resigned in turmoil in February of 1974 (according to the March 14, 1974 issue of The Daltonian) which was seven months before Jeffrey Epstein began teaching there that fall. While it is possible that Donald Barr may have hired Epstein, if he made personnel decisions long in advance, the Dalton School lost four math teachers (according to The Daltonian) prior to the 1974-75 school year. Therefore the school may have hired Epstein, in part, out of an urgent need to fill vacant positions—even though Epstein did not have a college degree."

[...]

Peter Branch was the acting headmaster after Barr's departure and he may have hired Epstein. Full verification would require access to Dalton's personnel records, if they still retain them. I put a Freedom of Information Law (FOIL) request into the State of New York Department of Education and they reported having no teaching license on file for Epstein—this may suggest that he was not planning on a career in teaching. Unlike public schools, it should be noted, a private school like Dalton does not require its teachers to possess a state teaching license or certificate.

***Update:** After publication, a reporter from the Miami Herald kindly provided me with Branch's phone number. When he spoke with me, he noted that he was upper school director before being appointed interim headmaster at Dalton. His appointment began on July 1, 1974 and Barr's contract at Dalton expired on June 30th. Branch does not recall hiring Epstein and he is relatively certain Barr or possibly the head of the Math Department hired Epstein because hiring decisions were typically made in the spring. He also noted that Barr liked to hire unconventional teachers to enhance the educational experience for students at Dalton.*

While at the Dalton School, Epstein was the coach of the math team. In competitions with several local schools, Epstein led the students to victory in one instance and to second place in another. At a February 1976 math meet, the Dalton team competed against Ramaz and the Manhattan Talmudic Academy with "Boss Epstein watching from the sidelines..." (The Daltonian March 5, 1976). At another match up in April 1976, Epstein told his team "a victory would be as easy as Pi." The paper reported Epstein would be starting a "math-track team" the following year due to his "unique philosophy of integrating physical exercise with spiritual and mathematical stimulation." The Dalton School students and families are comprised of some of the wealthiest families in the United States—unlike Epstein's own. But this access may have created an opening for him.

1975 (Feb 26)

Educational accountability is subject of Barr's talk

MONTPELIER — Donald Barr, former headmaster of the prestigious Dalton School in New York, will speak at Vermont College on March 1 at 9:30 a.m. under sponsorship of the Vermont Academy of Arts and Sciences. The subject of Barr's talk will be "Accountability in Education."

Barr is an articulate and witty spokesman for the conservative educators whose theories on education are contrary to the prevailing educational permissiveness. Trained in both sciences and literature, he was an assistant director of the National Science Foundation in Washington and from 1964 until the spring of 1974 was headmaster of the Dalton School.

DONALD BARR

Barr was born in New York, son of an economist and a psychologist, educated conservatively at Horace Mann and progressively at Lincoln School of Teachers College. He was in the Class of 1941 at Columbia University, where he studied mathematics and anthropology. He served with the U.S. Army as an Italian interpreter in a POW camp and as a member of an OSS "target team" in Germany.

In 1945 he joined the English department at Columbia and remained there for 10 years, taking an M.A. in English. In 1956 he moved to the school of engineering, where he became assistant dean and started and directed the science honors program (a pioneer series of Saturday classes at the university for gifted high school students) and the talent preservation project (a massive research and therapy program for high school underachievers carried out jointly with the New York City Board of Education).

In 1963 he took leave from Columbia to join the National Science Foundation in Washington as associate program director, returning to New York in 1964 to become headmaster of the Dalton School, where he remained for 10 years. His term there was not without controversy; parents and alumni were virgorously split on Barr's approach to education as he built into the generally permissive Dalton system a strength in academics and discipline which some applauded but which others felt were contrary to the school's flexible, pioneering educational plan, which for half a century had been widely copied both in the United States and abroad.

Recently Barr has returned to literature, this time as a novelist. "Space Relations," a work of science fiction, was published in 1973, and another will be appearing soon. He is also the author of "Who Pushed Humpty Dumpty?" He wrote a children's book on mathematics called "Arithmetic for Billy Goats," and has written other children's books on atomic energy, building and primitive man.

[HL0025][GDrive]

Council members replaced

Policy for the National Institute for Education, the research arm of the US Department of Education and now headed by Dr. Manuel Justiz, is set by a National Council on Educational Research, established in 1971 under President Richard Nixon.

Last May President Reagan distressed a number of academics when he abruptly ousted all of the council members, though many had not completed their appointed terms. Among those dropped was Council chairman Harold Howe, a former official of the Ford Foundation and former US Commissioner of Education, now on the faculty at the Harvard Graduate School of Education.

In a letter to Reagan last June, Howe challenged the ousters as "contrary to law." He also wrote: "The program plans of NIE for the next several years have been developed by the director without adequate opportunity for review by the Council."

Howe was replaced by George Roche 3d, president of a small Michigan college that has consistently turned down federal aid as a matter of principle. Reagan designated the following Council members:

Chairman: **George C. Roche 3d,** 47, president Hillsdale College, Hillsdale, Mich.; former history professor, author, winner of Freedom Foundation Award, Valley Forge, Pa.; BS history, Regis College, Colo.; MA, PhD, University of Colorado.

Donald Barr, 61, headmaster of the Hackley School, Tarrytown, N.Y.; former assistant program director of the National Science Foundation; author of several books on education and a former Republican district leader in New York City. AB and AM, Columbia University.

Milton B. Carus, 56, president and chief executive officer, Carus Corp. of Chicago; president and chief executive officer of Open Court Publishing Co.; publisher of Cricket magazine and president of two small Midwest railroads. BS, California Institute of Technology; study at University of Freiburg, Germany and the Sorbonne.

Paul Copperman, 35, president, Institute of Reading Development, San Francisco; author and teacher. BA, University of California, Berkeley; MA, Lone Mountain College, San Francisco (now part of the University of San Francisco).

J. Floyd Hall, 57, superintendent of schools, Langdale, Ala.; former superintendent and assistant superintendent in public schools in Midwest and South; named outstanding school superintendent in South Carolina in 1980. BS, MS, EdD, Auburn University.

J. Harvey Harrison Jr., 55, manager, program management international systems, Washington region defense systems division, Sperry Univac; formerly consultant and staffer with US Navy in London, Washington; BS, Middle Tennesse State College; MS, American University.

Donna H. Hearne, 42, former teacher and owner of small business handling driver licenses for Missouri; member Missouri River Republican Township Organization and National Federation of Republican Women; specialist on the American Revolution; BA, Washington University.

Onalee McGraw, 43, consultant on education to the Heritrage Foundation; founding board member, Christendom College, Vienna, Va.; BA, Whittier College; PhD, Georgetown University. Freedom Foundation Award.

Penny Pullen, 35, state representative, Illinois; newspaper columnist and reporter; BA, University of Illinois. Freedom Foundation Award.

Carl W. Salser, 61, executive director and editor, Educational Research Associates and National Book Co., Portland, Ore.; former teacher and author; BS, MS, Oregon State.

Elaine Y. Schadler, 38, director, Alumni Assn., Intercollegiate Studies Institute, Bryn Mawr, Pa.; former consultant, US Departments of Education and Health and Human Services; ABD, University of Pennsylvania.

Wallie C. Simpson, 51, founder and director Lower East Side International Community School, New York City; BA, Bishop College, Texas.

He raised hackles, Hackley

By WILLIAM NEUGEBAUER

WHEN HE RESIGNED as headmaster of the prestigious Dalton School in Manhattan in 1974, protesting what he considered the trustees' interference with his leadership, Donald Barr, headmaster of the Hackley School in Tarrytown for the past 10 years, admitted he was "somewhat anachronistic" in his views on the educational leadership of a school.

That became quite obvious when the stocky, graying teacher, poet, essayist and sci-fi novelist was inundated by an avalanche of parental fury in 1971 and assailed for his "prim, Victorian attitude."

Verbal brickbats were tossed at Barr after he noted, sardonically, that adolescents acting out the sexual revolution were "robots in heat."

"I'm not anti-sex," Barr was later to explain. "I just think that adolescents have no idea how to handle their sexuality."

Barr's book, "Who Pushed Humpty Dumpty?", a collection of essays published in 1971, attacked parental permissiveness while advocating such academic rigors as keeping foreign languages in the secondary schools, especially classical Latin and Greek.

Since becoming headmaster of the Hackley School in 1975, Barr has remained true to form, continually espousing a more vigorous assertion of teacher authority and a stronger emphasis on traditional academics.

"Under Donald Barr's leadership," said Robert Akin 3d, president of the Hackley board of trustees, "Hackley has attained a level of academic excellence rivaling that of the best preparatory schools in the nation."

Indeed, Akin noted in a communique to the Hackley community, the current curriculum at the 786-pupil school, situated about 25 miles north of New York City, offers eight languages and 11 advanced placement courses. Moreover, this year, Hackley has six National Merit Finalists. The school was founded in 1899 as a liberal arts boarding school for boys.

His confreres say that Barr has imbued the private, coed school in Westchester with the kind of academic excellence and leadership he advocated in helping the tony Dalton School to double its enrollment in the 10 often-stormy years he served there.

Now, in June 1986, Barr will be bowing out of the headmaster's role at the 111-acre campus overlooking the Hudson River and the Tappan Zee Bridge.

"Facilities (at Hackley) have been continually upgraded while the school's financial condition has been strengthened," Akin observed in his missive, adding that Barr will be "active in matters relative to the implementation of our new strategic plan, specifically in the area of fund-raising."

A 63-year-old native New Yorker, Barr is a former Manhattan Republican district leader who lived for many years on W. 116th St. and Riverside Drive, not far from Columbia University, where he earned bachelor's and master's degrees and served as an assistant dean of engineering and applied sciences.

During World War II, he taught higher math to anti-aircraft gunnery students at an Army camp in Hulen, Tex., and in 1945 joined the Office of Strategic Service (OSS) in Germany, aiding in de-Nazifying companies and industry. He also investigated German industrialists and SS men who had fled to South America.

After a stint with the National Science Foundation in Washington, Barr joined the Dalton School as headmaster in 1974.

Barr, who lives on campus with his wife, Mary, will be succeeded as headmaster by Peter Gibbon, a prolific education writer who has served as director of the Upper School at the Hackley School for the past six years.

Commenting on the transition, Akin said: "Hopefully, Don and Mary Barr will continue to be active in Hackley affairs for many years to come."

2004 (August) - Passing

See [HN00JO][GDrive]

Donald Barr, an educator, writer and former headmaster of the Dalton School in Manhattan and the Hackley School in Tarrytown, N.Y., died on Thursday at a hospital in Langhorne, Pa.

He was 82 and lived in Colebrook, Conn.

The cause was heart failure, his family said.

Mr. Barr, a traditionalist in academic matters, took a no-nonsense approach that rated good conduct as a virtue. He expressed his views on education not only at the schools he headed but also in national forums.

Before moving into private preparatory education, ***he established a science honors program at Columbia University that served as a model for similar programs elsewhere administered by the National Science Foundation****.*

He became head of Dalton in 1964. His sometimes stormy tenure ended in 1974 with his departure after disputes with the trustees over budget priorities and his disciplinarian approach to substance abuse.

The next year, he became headmaster at Hackley, where he soon dismissed more than two dozen students for disruptive conduct and poor academic performance. This time, he had parents and trustees in his corner. He also upgraded the curriculum, adding foreign languages and bolstering academic subjects and the arts.

Donald Barr, who was born in Manhattan on Aug. 2, 1921, majored in mathematics and anthropology at Columbia, graduating in 1941. He went into the Army and served with the Office of Strategic Services in Washington and Europe.

Returning to Columbia, he taught in the English department while getting his master's degree in 1951 ***and completing course requirements for a Ph.D****. But by then he was teaching courses with field work in sociology and political science at the School of Engineering and writing science and mathematics texts for elementary and junior high school students.*

In 1955 the engineering school asked him to oversee its efforts to spot promising elementary and secondary science students, including girls, and enlist them for advanced training at the school to help them rise to the college level. Joining the engineering dean's office, he then developed the Science Honors Program, which got the attention and support of the National Science Foundation.

Mr. Barr became assistant dean of the Faculty of Engineering and Applied Science in 1959, and the foundation eventually asked him to administer its entire Cooperative College-School Program. He did so beginning in 1963, continuing until he became headmaster at Dalton the following year.

Mr. Barr's wife, Mary Margaret Ahern Barr, a college teacher, died in 2001. He is survived by four sons, Christopher J. of Yardley, Pa.; William P. of McLean, Va., a former United States attorney general; Hilary B. T. of Heiningen, Germany; and Stephen M. of Newark, Del.; and eight grandchildren.

808 SCIENCE FICTION AND FANTASY LITERATURE: A CHECKLIST

JAMES BARLOW

Full Name: James Henry Stanley Barlow. Born December 1, 1921, at Birmingham, England. Son of Stanley Barlow (a bank clerk) and Gladys Jones. Married Joyce Margaret Everiss, June 24, 1949. Three children: Stephen, Gillian, Michael.

Education: Attended various English schools, 1927-37.

Career: Writer. Worked for Birmingham Water Company, 1939; joined RAF 1940, was invalided out for tuberculosis in 1941, and wrote articles for various magazines until 1946, when he returned to the water company; served as a rate inspector and investigator until 1960, when he moved to the country as a full-time writer. Died January 30, 1973.

Agent: Charles Lavell, Mowbray House, Norfolk St., London WC2, England.

* * * * *

ARTHUR K. BARNES

Arthur Kelvin Barnes was born 1911. He first appeared in the December, 1931 issue of *Wonder Stories* with "Lord of the Lightning," and is best known for a series of eight stories in *Thrilling Wonder Stories* featuring the female character Gerry Carlisle. He collaborated with Henry Kuttner on two science fiction stories. He was a member of the Los Angeles Science Fantasy Society, and a contributor to the SF fanzine *Sweetness and Light*. Biographical sketches appeared in TWS (October, 1939 issue), and in the fanzine *Imagination!* around the end of the 1930s. He died in 1969, presumably in Sunland, CA, where he was last known to be living. [courtesy, Forrest J Ackerman]

DONALD BARR

Full Name: Donald Barr. Born August 2, 1921, at New York, New York. Son of Pelham Barr (an economist) and Estelle DeYoung (a psychologist). Married Mary Margaret Ahern, April 22, 1946. Four children: Christopher James (born 1947), William Pelham (born 1950), Hilary Benedict Thomas (born 1952), Stephen Matthew (born 1953).

Education: B.A., Columbia University, 1941; M.A., 1951.

Career: Teacher. Literary Editor, *Tomorrow Magazine*, 1945-46; Instructor in English, Columbia University, 1945-56; Asst. to the Dean, and Asst. Dean, Columbia University School of Engineering, 1956-63; Associate Program Director, National Science Foundation, 1963-64; Headmaster, Dalton School, 1964-DATE.

First Professional Sale: "Not First, a Brief Message from Jeremiah," a poem published in the *New Republic*, 1944.

Literary Agent: John Cushman, 23 W. 43rd St., New York, NY 10036; Lecture Agent: W. Colston Leigh, 1185 Avenue of the Americas, New York, NY 10036.

Honors: Litt.D., St. Francis College, 1974.

Member: Country Day School Headmasters Association.

Interests: Reading, chess. Barr adds: "Most of my books have been for or about children, including children's books on atomic energy, building, and prehistoric man. Some others include *Arithmetic for Billy Goats*, a children's book on binary arithmetic; and a book of critical and controversial essays on education, *Who Pushed Humpty Dumpty?* I'm also part-author of various books on college teaching, school underachievement, and classroom organization."

* * * * *

CHARLES BARREN

Full Name: Charles MacKinnon Barren. Born December 21, 1913, at London, England. Son of Thomas Bearman Barren and Ada Boone Winfield. Married Vera Dace, November 21, 1936. Three children: Mervyn, Stuart, Dianne.

Education: Attended West Ham Technical College, and Forest Training College.

Career: Teacher. Has been a Warden for various youth and community centres; currently Lecturer in English and History, Barking Regional College of Technology, Dagenham, Essex, England (formerly South East Essex Technical College and School of Art).

* * * * *

G. J. BARRETT

Full Name: Geoffrey John Barrett. Born September 23, 1928, at Norwich, Norfolk, England. Son of John Barrett (a prison officer) and Violet May Leighton (a domestic servant).

Education: "Elementary."

Career: Writer.

First Professional Sale: *Tully's Return*, Robert Hale & Co., 1962.

Interests: Science, philosophy, occult history, piano music, general reading. "I am essentially a kind of 'all purpose' novelist. I have had over a hundred westerns published, and ten thrillers. I should add that this type of writer is becoming increasingly common in G.B., where survival is very difficult on any other terms."

The Clerk read as follows:

Senate amendment No. 15, page 14, line 8, insert ", of which $192,500,000 shall be available for grants to States."

Mr. FOGARTY. Mr. Speaker, I offer a motion.

The Clerk read as follows:

Mr. FOGARTY moves that the House recede from its disagreement to the amendment of the Senate numbered 15 and concur therein with an amendment, as follows: In lieu of the sum named in said amendment insert: "$198,225,000".

The motion was agreed to.

The SPEAKER. The Clerk will report the next amendment in disagreement.

The Clerk read as follows:

Senate amendment No. 32, page 21, line 6, insert: ", and $100,000 to be available only for the National Conference on Education of the Deaf."

Mr. FOGARTY. Mr. Speaker, I offer a motion.

The Clerk read as follows:

Mr. FOGARTY moves that the House recede from its disagreement to the amendment of the Senate numbered 32 and concur therein with an amendment, as follows: In lieu of the matter inserted by said amendment insert the following: ", $100,000 to be available only for the National Conference on Education of the Deaf, and $150,000 to be available only for transfer to the appropriation 'Office of the Secretary, Salaries and Expenses' for a comprehensive study of training programs financed in whole or in part with Federal funds."

The motion was agreed to.

The SPEAKER. The Clerk will report the next amendment in disagreement.

The Clerk read as follows:

Senate amendment No. 45, page 36, line 7, after the figure, insert: ", of which $1,000,000 shall be available for the training of clinical anesthesiologists."

Mr. FOGARTY. Mr. Speaker, I offer a motion.

The Clerk read as follows:

Mr. FOGARTY moves that the House recede from its disagreement to the amendment of the Senate numbered 45 and concur therein.

The motion was agreed to.

The SPEAKER. The Clerk will report the next amendment in disagreement.

The Clerk read as follows:

Senate amendment No. 65, page 53, line 5, after "Welfare", insert ": *Provided*, That the position now designated as Comptroller, level V, shall hereafter be designated as Assistant Secretary, Comptroller, level V.

Mr. FOGARTY. Mr. Speaker, I offer a motion.

The Clerk read as follows:

Mr. FOGARTY moves that the House recede from its disagreement to the amendment of the Senate numbered 65 and concur therein.

The motion was agreed to.

The SPEAKER. The Clerk will report the next amendment in disagreement.

The Clerk read as follows:

Senate amendment No. 70, page 57, after line 2, insert:

"SEC. 207. None of the funds contained in this title shall be available for additional permanent Federal positions in the Washington area if the proportion of additional positions in the Washington area in relation to the total new positions is allowed to exceed the proportion existing at the close of fiscal year 1966."

Mr. FOGARTY. Mr. Speaker, I offer a motion.

The Clerk read as follows:

Mr. FOGARTY moves that the House recede from its disagreement to the amendment of the Senate numbered 70 and concur therein.

The motion was agreed to.

A motion to reconsider the votes by which action was taken on the conference report and on the several motions was laid on the table.

CORRODING THE MORAL FIBER OF THE UNITED STATES

Mr. ASHBROOK. Mr. Speaker, I ask unanimous consent to extend my remarks at this point in the RECORD and to include extraneous matter.

The SPEAKER. Is there objection to the request of the gentleman from Ohio?

There was no objection.

Mr. ASHBROOK. Mr. Speaker, the September 16, 1966, issue of U.S.A. by Alice Widener, who attended the Second Annual Conference of Socialist Scholars at the Hotel Commodore in New York City on the weekend of September 9–11, recounts for us the tenor of the conference and the nature of the proposals advanced by the various speakers. For example, Polish-born Isaac Deutscher, of London, advocated "complete freedom of sexual life that will abolish the family."

The youth of this Nation was advised to "turn on, tune in, drop out" through use of the hallucinogenic drug LSD and marihuana.

Another source of wisdom and counsel urged: "We must develop the moral-sexual rebellion of the youth."

As only the full text of the above-mentioned issue can do justice to the new and old left program for America, I request that the special report of U.S.A. entitled "In the West and West Ballrooms," by Alice Widener be inserted in the RECORD at this point.

[From the publication U.S.A., Sept. 16, 1966]

IN THE EAST AND WEST BALLROOMS

(A special report by Alice Widener on the second annual conference of Socialist Scholars)

"The temptation of our day is to accept the intolerable, for fear of still worse to come."
—"The Revolution of Nihilism," 1939, by Hermann Rauschning, former President of the Free State of Danzig.

"Only the clunks stay in the clink," said the Socialist Scholar, in the West Ballroom of the Hotel Commodore, New York City, Sunday, September 11, 1966. "Fortunately—as at Berkeley, for example—the parents of middle class and wealthy students in our movement bail them out."

REGISTRATION

While ordinary travelers from out of town were registering at the reception desk in the main lobby at the Hotel Commodore in New York City, Friday evening, September 9, 1966, more than two thousand members of the Old and New Left were registering at tables set up in ballroom floor hallways to attend the Second Annual Conference of Socialist Scholars.

The New Left movement in our country is generally described by misinformed or misleading members of the press as a spontaneous, amorphous grouping of rebellious youth. It is not. Any non-Socialist who attended the evening and daytime panel sessions of the Socialist Scholars during the week-end of September 9–11, would have been forced to recognize, as did I, that most members of the New Left are activists instigated, controlled and manipulated by disciplined members of the Communist Party working in a united front with Marxist ideologues.

Was it to foster illusion or misconception that the big press—the wire services, broadcasting networks, big circulation magazines and newspapers—stayed away from the conference? It is hard to find a satisfactory explanation of why they granted it privileged sanctuary in the East Ballroom and West Ballroom of the Hotel Commodore in the center of the city.

There were no TV cameras to film the arrival from London of white-bearded radical Marxist zealot Isaac Deutscher, invited by the Socialist Scholars to open their conference with a discourse "On Socialist Man." Nor were there any cameras turned on 54-year-old Victor Perlo, identified in Congressional hearings as a member of a Soviet espionage ring while he was in U.S. Government employ during World War II. No well known reporter was present to interview conference panelist Communist Herbert Aptheker, age 51, now running for Congress in Brooklyn, N.Y., who last year told the First Annual Conference of Socialist Scholars, "Of course, Watts was *glorious!*"

For some inexplicable reason it seems that nowadays our communications media personnel report graphically only on the effects of the Leftist radicals' activities—on the bloody race riots, street demonstrations, disrupting and costly acts of civil disobedience—but stay away from the gatherings where plans for such activities are hatched, though most meetings, as this one was, are publicly announced.

Last September, after *Barron's National Business and Financial Weekly* reprinted my article about the First Annual Conference of Socialist Scholars at Columbia University, the UPI wire service got in touch with *Barron's* to request quotation rights. The request was immediately granted. But not a single word about the Socialist conference went out over UPI or any other wire service, though no statement or quotation in my article ever was challenged for accuracy. Soon after *Barron's* carried my article, however, several of the leading Socialists figuring in it—such as Prof. Staughton Lynd of Yale—made national and international headlines for radical activities that aided our Communist enemies in Hanoi and were conducted in total defiance of the U.S. Government.

Unquestionably, even before the end of 1966, several of the registrants at the Second Annual Conference of Socialist Scholars will make headlines and TV camera appearances as friends of our enemies, enemies of our friends, and as subverters of our American way of life.

BOLSHEVIK NEW LEFTISM

There was not an empty chair in the 800-seat Windsor Ballroom at the Commodore when the Socialist Scholars and their radical Leftist audience gathered to hear Polish-born Isaac Deutscher of London. He was introduced by Prof. H. H. Wilson of Princeton University, who described Mr. Deutscher as "a contributor to *The Economist* and *The Observer*." This is a fact, though most Deutscher articles in those publications were unsigned.

When Deutscher went to the rostrum, the audience stood to honor him; they did so again after his address. Whether the huge

[HG003E][GDrive]

On Tuesday, September 13, the *New York Daily News* reported, "About 500 welfare recipients picketed the Department of Welfare building . . . and staged sit-downs and sit-ins yesterday. . . . As police called reinforcements, the demonstrators blocked one of the two entrances to the building and marched along the sidewalk."

Socialist Scholar Prof. Cloward of Columbia certainly was right about the success of his Wednesday night meetings. Evidently his strategy of "disruptive tactics" will require costly police reinforcements at city welfare departments throughout our nation.

The prospects delighted Prof. William Ryan, formerly of Harvard now of Yale, who described himself to the audience as "a radical without portfolio." He said, "I have been enchanted with the Cloward strategy of blowing a fuse in the welfare agencies, housing developments, and among unmarried mothers. I wonder what would happen if there was a really systematic overload."

Sherman Barr, of Mobilization for Youth, said that through the techniques used in his organization for welfare, "further demand is stimulated rather than decreased." Mr. Barr called for "indoctrination in group methodology" and said that on the lower East Side, for a group of 350, they had been able to get $85,000 for "an extremely expensive operation requiring money for phones, mimeographing, etc."

When a member of the audience went to the floor microphone during the question period to ask whether Dr. Cloward's strategy is a substitute for "Socialist organization of the proletariat, the industrial factory workers," Dr. Frances Piven of Columbia replied from the dais: "I really only want to make one point—the disruption of the system. Welfare rolls will begin to go up; welfare payments will begin to go up—the impact will be very, very sharp. The mounting welfare budget will increase taxes, force cities to turn to the federal government. We have to help people to make claims; for this they will organize and act."

What the entire strategy amounts to is a diabolical Socialist plan to increase the number of welfare clients through systematic overloading, to instigate "the poor" to make bankrupting demands, and thus wreck the existing financial structure of our society. There was no talk at all at the conference of improving the present welfare system, of decreasing the number of welfare recipients, or the number of unmarried mothers. All the emphasis was on "disruption" for the purpose of forcing chaos and conditions making our society ripe for the radical overthrow of existing institutions and a Socialist take-over. Much of this was made perfectly clear in Prof. Cloward's plan to disrupt private enterprise and "release the flow of rewards to the poor" by increased taxation on corporations that will "disrupt corporate power" and end "by disrupting production."

The big press coverage of the welfare recipients' demonstration at City Hall was at the wrong time in the wrong place. NBC and CBS cameras should have been focused on Prof. Richard A. Cloward as he read his scholarly Socialist paper in the ballroom at the Commodore. The TV newscasters would have gotten a beat on news about to burst into print. And if the U.S. Attorney General had been present at the Second Annual Conference of Socialist Scholars, he might have obtained most useful information about who are the real agitators in our midst.

DR. LEONARD DUHL
. . . speaker

DR. BAUMGARTNER
. . . Harvard Medical School

SHERMAN BARR
. . . Mobilization for Youth

Social Workers Eye The Great Society

"The Great Society: Alive or Dead?" is the question scheduled for discussion this week by more than 2200 social workers at the 64th annual Fall meeting of the Massachusetts Conference on Social Welfare.

Topics will include public and private financing of social welfare, protection of clients' rights, drug abuse, day care and Headstart, school personnel and the problem child, unmarried mothers, and the neglected middle class.

More than 100 speakers from government, industry, universities, the medical profession, and social agencies will address sessions at the Statler Hilton Hotel for three days, starting Nov. 29.

Program highlights include discussion of the "Impact of Our Society on the Poor," by Edward Sparer, director of New York City's Center on Social Welfare Policy and Law, and an address Thursday night by David R. Hunter, executive director, Stern Family Fund of New York.

A session on multiservice centers will feature Sherman Barr of Mobilization for Youth, New York; Hubert E. Jones, director, Roxbury Multiservice Center; and Joseph Vilimas Jr., Kennedy Family Service Center, Charlestown.

Dr. Leona Baumgartner, professor of Social Medicine, Harvard Medical School, will discuss health and welfare services to the aging at a session Friday.

"The Social Welfare Component in the Model Cities Program" will be presented Friday by Dr. Leonard Duhl, special assistant to the Under Secretary of Housing and Urban Development, Washington, D. C.

[HN00RA][GDrive]

Nov. 26, 1982 - Dr. Sherman Barr, 57, Chief; Of Social Welfare at N.Y.U.

NY Times article = [HN00RB][GDrive]

Dr. Sherman Barr, associate professor of social work at New York University and chairman of the social-welfare programs and policies curriculum at the university's School of Social Work, died last Friday at St. Vincent's Hospital. He was 57 years old and lived in Manhattan.

Dr. Barr had been a faculty member for 14 years and previously had been director of the Neighborhood Service Center program of Mobilization for Youth, an organization that combats juvenile delinquency. He was born in New York City, graduated from Brooklyn College and received a master's degree and a doctorate from the Columbia University School of Social Work.

He recently had received the 1982 Great Teacher Award of the N.Y.U. Alumni Federation. He is survived by his wife, Elinor; two sons, David and Daniel, and a daughter, Rachel, all of New York City.

1983 (April 15) - PUBLISHERS AND N.Y.U. SETTLE SUIT ON COLLEGES' PHOTOCOPYING RIGHTS

See [HN00RC][GDrive]

'Nine major publishers announced yesterday that they had dropped their case against New York University and eight of its professors who they said had violated Federal copyright laws by improperly photocopying material for classroom use.

In exchange, the university agreed to certain guidelines governing the duplication of copyright works and to monitor compliance by the faculty.

Lawyers for the publishers, which included Random House, Simon & Schuster and Houghton Mifflin, said the settlement with the country's largest private university could set a precedent and help curb what they said were widespread violations of Federal copyright laws. They threatened further legal action should such practices continue at N.Y.U. or elsewhere.

Association Financed Suit

"The publishers are hopeful the principles reached in this agreement will be taken to heart by other colleges and universities, and by faculties and administrators alike," said Jon A. Baumgarten, who represented the Association of American Publishers, which financed the suit. "If our hopes are unfounded, we will take appropriate action."

'We're not out to hang faculty members from a lamppost and cut out all photocopying," he said. "The assumption is not that photocopying should be stopped but that the rights of copyright owners should be respected."

The guidelines restrict teachers who want to use multiple copies of copyright materials in the classroom, and are based on the length of the excerpts copied. They do not apply to individual students making occasional copies for their own use.

Similar provisions have already been adopted voluntarily by Yale and Johns Hopkins Universities. The suit, which was filed last December in Federal District Court in Manhattan, accused the defendants of "engaging in the unauthorized and unlawful reproduction, anthologizing, distribution and sale of the publisher's copyrighted work."

Andrew Schaffer, N.Y.U.'s general counsel, acknowledged that the university would have to compensate various publishers for duplicated materials in the future. But he denied that the agreement would necessarily lead to higher costs for students or that it would curb the traditional discretion of professors to design their courses.

"This agreement does not in any way, shape or form restrict faculty members' choices of curriculum materials," he said. "What will change is that, in many instances where photocopying was previously done, the prior permission of the publisher will be required.

'We're hopeful that this will enable faculty members to understand in a much more specific and practical way what is permitted and not permitted under the copyright laws." Standards for 'Fair Use'

The guidelines agreed to by N.Y.U. were originally negotiated by authors, educators and publishers, and were contained in the report accompanying the 1976 Copyright Act. Together, they define minimal standards for the "fair use" of copyright material.

Under these guidelines, for instance, teachers can, subject to some limitations, make multiple copies of complete poems of fewer than 250 words, as well as of complete articles, stories or essays of fewer than 2,500 words, without permission. They are also free to copy excerpts - of 1,000 words or 10 percent of the total text, which ever is less - of longer works.

Where a professor determines that photocopying is explicitly barred by the guidelines, the agreement continues, permission must be sought from the publisher. The professor seeking such authorization must specify the exact material to be used, the number of copies to be made and the use planned for the duplicated materials.

In some circumstances, according to a policy statement contained in the settlement agreement, the fair-use doctrine could permit photocopying beyond that allowed under the guidelines. When a faculty member believes he has been unreasonably denied permission to duplicate materials, he must seek authorization from the university's general counsel. Only those following such procedures will be defended by the university in any subsequent suits. 'Full and Prompt Inquiry'

The agreement obliges N.Y.U. to "act diligently and in good faith to foster compliance" with the new policy, as well as to make "full and prompt inquiry" into possible violations and to take "appropriate action" where wrongdoing is discovered.

The university also pledged to distribute copies of the new policy to its faculty and to post notices at all university copying facilities.

The other publishers in the lawsuit were Addison Wesley, Alfred A. Knopf, Basic Books, Little Brown, Macmillan and the National Association of Social Workers. The N.Y.U. professors named as defendants were Martin Hamburger, Phyllis Mervis, Thelma B. Chesney, Terri Schultz, Robert Sklar, J. Rosen, Stuart Johnson, Robert Sharp and William G. Simon. **A ninth professor named in the original suit, Sherman Barr, died recently.**

The publishers' case against the Unique Copy Center, situated near the N.Y.U. campus, was unaffected by the settlement.

2007 Interview - ActUpOralHistory.org

See [HW002G][GDrive] -

SARAH SCHULMAN: Okay, so we just start by your saying your name, your age, today's date, and where we are.

DAVID BARR: I'm David Barr; I'm 51. It's May 15, 2007. And we're in my apartment in New York.

SS: On Second Avenue –

DB: On Second Avenue and 12th Street.

SS: Where you've been since 1979.

DB: Where I've lived since 1979.

SS: A true New Yorker. And full disclosure; your father and my mother worked together at Jewish Board.

DB: Oh –

SS: **Sherman Barr, yes**.

DB: Yeah. It was a long, long time ago, then.

SS: Yes. So you're a real New Yorker, New Yorker, New Yorker?

DB: I'm a third-generation native.

SS: Native New Yorker. What neighborhood did you grow up in?

DB: In Brooklyn; in Sheepshead Bay, Brighton Beach.

SS: And did you go to Brighton, which high school did you –

DB: I went to John Dewey High School, an experiment in public education.

SS: And did it work for you?

DB: Oh yeah. Yeah. I was –

SS: So you grew up in one of those Jewish socially oriented families.

DB: Very much so, yeah.

SS: And do you think that you were trained to be a community activist by your family?

DB: Yes.

SS: How did they do it?

DB: They took me on demonstrations from when I was a young kid. I went on, I remember going to — and it's a really long answer, but –

SS: Go for it.

DB: – I was taken on demonstrations to integrate housing in Brooklyn; to ban-the-bomb demonstrations in the early '60s. I was a part of, my parents helped to organize a volunteer reversed busing program in Brooklyn in the '60s, where all these sort of white, middle class kids from Brooklyn were bused to a predominantly black and Latino elementary school in Fort Greene, which was a very different neighborhood than it is now. So I was involved in that, and it was a very high profile program, so there was a lot of press involved, and like I remember all that. And then a lot of antiwar, anti–Vietnam War activity in junior high and high school.

SS: How left were your parents?

DB: My mother was thrown out of Erasmus High School for distributing socialist literature. And my father was a member of the Welfare Rights Movement and started Mobilization for Youth on the Lower East Side.

SS: So were they ever Party members, or –

DB: No, they were never, no, so I'm a pink diaper –

SS: Okay. So like solid liberal background.

DB: Nn-, by liberal, liberal would be a sneer to liberal. It would be definitely be more left than that.

SS: Like socialists –

DB: Yeah.

SS: Yeah. But your mother never belonged to a party, or –

DB: No.

SS: No.

DB: She belonged, I guess before, as a teenager, she was a member of the Socialist Party, or the Young Socialist Group.

SS: Oh, the Trotskyites, or something like that?

DB: I don't, now you're getting into –

SS: Now I don't know.

DB: – yeah.

SS: Okay. But anyway, it's been in the family for a long time.

DB: Yeah, yeah.

SS: And do you remember them explaining to you why it was important to show up for social change, or –

DB: Um – yeah. It's sort of most of what we talked about, I guess. It was like that was the discussion in the house. That and food. And just, stopping the kids

DB: Uh – yeah. It's sort of most of what we talked about, I guess. It was like that was the discussion in the house. That and food. And just, stopping the kids from fighting with each other. I went to a radical, leftist summer camp. It was a real –

SS: What was that called?

DB: It was called Camp Thoreau. And it was, it was in New Paltz, outside of New Paltz, and it was – the Rosenberg kids were there; the Robeson kids were there. It was an interesting place to be in the '60s, in terms of the kids that were there, the counselors that were, what the counselors were doing when they weren't at camp and stuff like that.

SS: So what were the first movements that you participated in?

DB: I started a group called Children's Strike for Peace, in junior high school

SS: Wow.

DB: In like seventh grade.

SS: And what did you guys do?

DB: Nothing. We went, we went to, I don't know; what did we do? We, we – I guess we participated in demonstrations, you know. Because I, I remember going to most of the major Vietnam War demonstrations, and volunteering at the – the office was on 17th Street, off of 5th Avenue, and it was like the Mobilization to End the War; I guess that was the name of it. And I would go and volunteer there, and – yeah.

SS: So what do you think your vision was for what your life was going to be like, when you were coming out of high school, at that time?

DB: I got really interested in theater. I got interested in avant garde environmental group theater, because of, there was some program at the high school that I got involved in, where we did this very sort of experimental, communal theater piece.

And I was taken to see the Performance Group in what was going to become SoHo. And saw their piece called Commune. And it really changed my life. I really said, oh, this is what I want to do. And so I got involved in doing that kind of work. And went to theater

school at NYU when I got out of high school; moved into the city.

SS: Oh, I never knew that. So who did you study with, or who did you work with?

DB: Well, first I studied with Stella Adler in this program there, and I really hated the program. She was a – very entertaining, but a pain in the ass. But then I got involved with the Performance Group, and I left school to go work with them for a while. And the guy who started, there was a guy in The Performance Group named Steve Borst who started a gay and lesbian theater group – and this was 1972, 1973; three, maybe. So it was probably the first gay and lesbian theater group, ever. And I was 18, and I left college so I could be a part of that. And we created a piece called Slime Mourning. Which was, oddly, about death and sort of how gay and lesbian people relate to rituals of death in society, which was kind of odd, that we, that was our focus, given what was to come. And Ron Vawter was a member of the group, because he was the business manager of the Performance Group, and good friends with Steve, and that was sort of how he started acting

PAUL BARR

FROM a cold, unemotional scientist's viewpoint, war is a force which calls a halt to man's evolution, and in every respect, sends the engines of progress careening in reverse down the hills of destruction into the valley of despair. Science must accept with a guilty conscience the oft repeated charge that its inventions and discoveries have become engines of destruction in the hands of certain maniacs. Science's only possible alibi is that it has worked in a social vacuum and has thrown its genius on to the marketplace for sale to the highest bidder. The present war is the most condemning indictment of science on the charge that it has either been ignorant of, or indifferent, to the social implications of scientific discovery.

If one were to attempt a justification of war, he might possibly conceive of this: that war demands basic changes, especially scientific ones, which are often for the good of mankind. In this total war, scientific laboratories have been glowing and humming twenty-four hours a day. It has become the job of the chemist to devise new and more potent explosives and poison; it has been the task of the engineer to draft the plans for new guns, radios, mobile units, ships and other monsters of war; there is a job for the mathematician, the physicist and the mechanic in operating our machines; so there is for the physician in treating our wounded.

These new skills, trades, inventions and discoveries are not going to terminate with the war. On the contrary, they will be the springboard for the science of our post-war world which will give the common man a rich and fruitful future in everyday comfort. It is this legacy of war that might be considered an advance over the conditions of the prewar world. War hastens the enrichment of the world with scientific discovery.

To be more specific, here are some of the advances necessitated by the war. In the field of medicine, there have been innumerable cures and treatments discovered. The thousands of pitifully wounded soldiers have given the stimulus to a sweeping wave of discovery. Atabrine, a synthetic quinine, has been developed. The amazing family of sulpha drugs has expanded and its disinfecting powers have saved literally hundreds of thousands of soldiers from untimely death. The giant steps of surgery are astounding. Artificial limbs have been reconnected to the living muscles; the Stader steel pin reduction splint perfectly reforms mangled and broken bones; wax treatments and miraculous skin graftings have saved the lives of burn victims. Probably the most far-reaching discovery necessitated by this horrible war is blood plasma transfusion. After the typing, drying, and preserving treatment, this life blood, donated by patriotic citizens, is shipped to the battlefield where it is injected into the hungry veins of the wounded.

The achievements toward better machines of war are not to be disregarded. The lists of improvements in fire-power, range, safety, load, speed and maneuverability of the air-

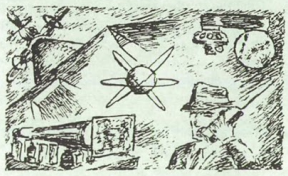
2019-11-23-twitter-agentrevolt-1198298419590320129-EKE2Cu5WwAAuLpB.jpg

plane all but stagger the mind. The astonishing records set by Kaiser in the production of ships bears testimony to the rapid advance of industry marching hand in hand with science. Tanks, guns, ships and planes rolling off our assembly lines are in themselves manifestations of the giant steps taken forward by American science because of the demands of war.

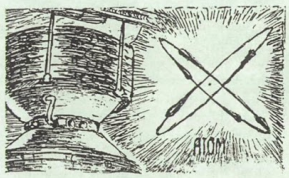
No, the war will not be a totally wasted effort. There is much good to be squeezed for the blood, sweat and tears of this brutal war against tyranny and oppression. After the smoke of battle clears, after the dead have been buried, and after the world has realized a new birth of freedom, there will be work to do. And few will play a more significant role in world reconstruction than the scientist. The part of science in postwar reconstruction is multilateral. Science has had its incentive, its stimulus from the war itself, but its task will only have started when this war ends. There will be a torn and diseased world to be brought back to its feet. There will be a population eagerly awaiting the things for which it has so valiantly fought. There will be a hungry craving for a better world in the hearts and minds of every man.

This, then, is the task of science: to bring freedom from fear and freedom from want to the common man; to construct a world, so rich, so envigorating, that a soldier can stand up and truly say his efforts have not been in vain.

To what extent is science assuming this mighty burden? One need not have great imagination to see the promise of organic chemistry. Already to meet the war shortages, chemical laboratories have produced neoprene, butyl, thiokol, ameripol and other synthetic rubber. They have produced synthetic materials like nylon and rayon acetate. Plastics are in themselves a vast and untapped field. Amberlite, zeolite, and bakelite already appear on the markets of the nation. If you will dwell for a moment in the realm of organic chemistry, you cannot help sensing the meaning of the apparently insignificant carbon atom. Here is a field of science which will give the world of the future the power for its engines of production, the plastics and synthetics for its home, and the dyes, drugs and medicines for its everyday comforts.



In another closely related field, the chemist and the physicist of the future are going feverishly to attempt to smash the atom. This alone will be the most far-reaching achievement that the world has ever known. It is hard to conceive of the potential powers of uranium 239, a gram of which will operate a great battleship for five years. Here is another goal toward which science now strives, a goal that will open for us the doors to undreamed-of wealth and power. The remaking of every grain of matter on earth will be at the scientist's fingertips. Stored in nature's vaults there is unheard-of energy that needs only to be cracked by man. And, if, in proper hands, it will bring with it a world that far outshines even the wildest expectations.

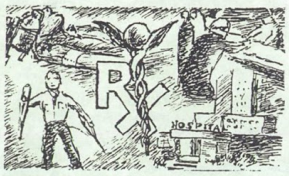


And now, to medicine. Just as the chemist delves into secrets of the material structure of the earth, so does the doctor seek the very secret of life. He will pour forth every energy in his veins. The first steps have already been made. The chemical structure of much of the cell has been determined. The discovery of biotin is an ex-

2019-11-23-twitter-agentrevolt-1198298419590320129-EKE2Cu5WkAET8Qh.jpg /

ample. This may seem fantastic, but Jules Verne's submarine, remember, was thought to be fantastic too.

But enough of that. There is a practical side to medicine. Medicine has an influential part to play in the *permanent reconstruction* of the world. There are vitamins to be discovered and to be produced synthetically. There are food concentrates to be developed. And the present goal of medicine is along these lines. There is a starved and downtrodden Europe to feed and rehabilitate. Public Health stations will be established in every corner of the earth. Nu-



trition and strength will be given to the bushman of Borneo and slum dweller of Chicago alike. Socialized medicine is no idle dream. It is on its way to becoming a reality. Great engineering projects and electrical plants bringing new hope to millions of newly awakened peoples are, let us hope, no figments of the imagination.

War has brought disease. Even now the army offers splendid opportunity for medical research. The army doctors combat tropical disease bred by insects. This is but the starting point for a great international war against plague of the body and disease of the mind. Doctors Freeman and Watts are opening a fantastic field called psycho-surgery. The surgeon's knife will purge the brain of evil. Psychosis, mental aberrations, inhibitions and obsessions will be removed from the minds of men. Medicine is taking great strides. This astounding advance will not be stopped. On the contrary, a world that cries for medical aid will bring forth the best in our doctors.

Another branch of science that will be of vital importance in our postwar world is

electronics. The further success in the development of the electronic tube can prove to be as momentous as the smashing of the atom itself. Army signal corps technicians have made significant discoveries in radio, television and electron rays. These advances are war secrets now, but when war is over, the whole world will be shaken by extensive accomplishments in frequency modulation and television, lightweight, two-way radios, and especially the electron microscope, an instrument which has already magnified to the colossal proportions of 100,000 times and promises to invade the privacy of the minutest bacteria and even the atom.

No imagination, no matter how fertile, can ever grasp the wonders of the cosmic ray, of the stars, of a source of stellar energy. Think of harnessing the sun, the stars, the energies of the gallaxies!

And there is more — there is science of plants growing in chemicals. The farm will no longer be a place to grow vast quantities of wheat and corn and potatoes. Production of food will be concentrated in chemical vats and the farm will grow soy beans and other materials to be used in the manufacturing of plastics.

There is going to be unlimited air travel. The networks of the world will be linked by the airplane. There's going to be a helicopter for every family. Pre-fabricated housing and scores of like comforts will exist in the postwar world. In short, there will be comfort, security, longevity and happiness for everyone.

Scientific achievements in the future will enable us to arise from the valley of despair into a new and better world with a firm resolution that promises hope for all mankind.

* In connection with law practice, at Shaw, Pittman, when the firm was asked to set up a new corporation for a client, I would occasionally be listed as an incorporating director/officer for purposes of filing incorporation papers but would be replaced by the permanent director/officer at the first corporate meeting. In one case, however, I actually did serve on a client's board. In April 1986, Scottish Widows Fund Assurance Society, a U.K. insurance company, asked me to serve on the board of its two wholly-owned U.S. subsidiaries, "Dalkeith Corporation" and "1146 19th Street Corporation". These corporations own a commercial office building in Washington, D.C. I served as a director, vice president, and treasurer of each subsidiary from April 1986 to January 1989.

The second of four [brothers], [William Barr] grew up on the Upper West Side [of Manhattan]. [...] After high school, Barr entered **Columbia University**, where he majored in government and graduated with a Bachelor of Arts in 1971. He then did two years of graduate study at Columbia, receiving an Master of Arts in government and **Chinese studies** in 1973. While employed at the Central Intelligence Agency (CIA) from 1973 to 1977, he attended the evening division of George Washington University Law School, graduating with a Juris Doctor in 1977.

Early career

From 1973 to 1977, Barr was employed by the CIA, initially for a short period as a China analyst, then in the legislative affairs section. After graduating from law school, Barr was a law clerk to Judge Malcolm Wilkey of the U.S. Court of Appeals for the District of Columbia Circuit from 1977 through 1978. He was in private practice with the Washington law firm of Shaw, Pittman, Potts & Trowbridge from 1978 to 1982 and again from 1983 to 1989,[9] after serving as **Deputy Assistant Director for Legal Policy on the domestic policy staff at the Reagan White House from May 1982 to September 1983**.

U.S. Department of Justice

In 1989, at the beginning of his administration, President George H. W. Bush appointed Barr to the U.S. Department of Justice as Assistant Attorney General for the Office of Legal Counsel (OLC), an office which functions as the legal advisor for the President and executive agencies. Barr was known as a strong defender of presidential power.[12] He wrote an advisory opinion justifying the U.S. invasion of Panama and arrest of Manuel Noriega.[12] He wrote legal justifications for the practice of rendition,[13] so that the FBI could enter onto foreign soil without the consent of the host government to apprehend fugitives wanted by the United States government for terrorism or drug-trafficking.[12] Barr declined a congressional request for the full opinion, but instead provided a document that "summarizes the principal conclusions." Congress subpoenaed the opinion, and its public release after Barr's departure from the Justice Department showed he had omitted significant findings in the opinion from his summary document.[14]

U.S. Deputy Attorney General (1990–1991)

In May 1990, Barr was appointed Deputy Attorney General, the official responsible for day-to-day management of the Department. According to media reports, Barr was generally praised for his professional management of the Department.[15][16][17]

During August 1991, when then-Attorney General Richard Thornburgh resigned to campaign for the Senate, Barr was named Acting Attorney General.[18] Three days after Barr accepted that position, 121 Cuban inmates, awaiting deportation to Cuba, seized 9 hostages at the Talladega federal prison. He directed the FBI's Hostage Rescue Team to assault the prison, which resulted in rescuing all hostages without loss of life.[19][20]

U.S. Attorney General (1991–1993)

First nomination and confirmation

It was reported that President Bush was impressed with Barr's management of the hostage crisis; weeks later, Bush nominated him as Attorney General.[21]

Barr enjoyed a "sterling reputation" among Republican and Democratic politicians alike.[22] His two-day confirmation hearing was "unusually placid", and he was received well by both Republicans and Democrats on the Senate Judiciary Committee.[23] Asked whether he thought a constitutional right to privacy included the right to an abortion, Barr responded that he believed the constitution was not originally intended to create a right to abortion; that *Roe v. Wade* was thus wrongly decided; and that abortion should be a "legitimate issue for state legislators".[23] "Barr also said at the hearings that Roe v. Wade was 'the law of the land' and claimed he did not have 'fixed or settled views' on abortion."[24] Senate Judiciary Committee Chair Joe Biden, though disagreeing with Barr, responded that it was the "first candid answer" he had heard from a nominee on a question that witnesses would normally evade; Biden hailed Barr as "a throwback to the days when we actually had attorneys general that would talk to you."[25] Barr was approved unanimously by the Senate Judiciary Committee, was confirmed by voice vote by the full Senate,[26][27] and was sworn in as Attorney General on November 26, 1991.[28]

William Pelham Barr (born May 23, 1950) is an American attorney serving as the 85th United States Attorney General since 2019, previously holding the office from 1991 to 1993.
From 1973 to 1977, Barr was employed by the Central Intelligence Agency during his schooling years. He then served as a law clerk to judge Malcolm Richard Wilkey. In the 1980s, Barr worked for the law firm Shaw, Pittman, Potts & Trowbridge, sandwiching a year's work in the White House of the Ronald Reagan administration dealing with legal policies. Before becoming Attorney General in 1991, Barr held numerous other posts within the Department of Justice, including leading the Office of Legal Counsel (OLC) and serving as Deputy Attorney General. From 1994 to 2008, Barr did corporate legal work for GTE and its successor company Verizon Communications, which made him a multimillionaire. From 2009 to 2018, Barr served on the board of directors for Time Warner.
Barr is a longtime proponent of the unitary executive theory of nearly unfettered presidential authority over the executive branch of the U.S. government.[1][2][3] In 1989, Barr, as the head of the OLC, justified the U.S. invasion of Panama to arrest Manuel Noriega. As deputy attorney general, Barr authorized an FBI operation in 1991 which freed hostages at the Talladega federal prison. An influential advocate for tougher criminal justice policies, Barr as attorney general in 1992 authored the report The Case for More Incarceration, where he argued for an increase in the United States incarceration rate.[4]Under Barr's advice, President George H. W. Bush in 1992 pardoned six officials involved in the Iran–Contra affair.
Barr became attorney general for the second time in 2019. During his ongoing term, he has received criticism from some for his handling of several challenges, including his mischaracterized summary and selective redaction of the Mueller report, interventions in the guilty convictions and sentences of former advisors to President Trump, Roger Stone and Michael Flynn,[5][6] and allegations of political interference in the removal of Geoffrey Berman from his Southern District of New York attorney position in a matter pertaining to the indictment of Turkish bank Halkbank, a bank with close personal ties to Recep Tayyip Erdogan.[7][8]

Early life and education
Barr was born in New York City in 1950. His father, Donald Barr, taught English literature at Columbia University before becoming headmaster of the Dalton School in Manhattan and later the Hackley School in Tarrytown, New York, both members of the Ivy Preparatory School League. Barr's mother, Mary Margaret (née Ahern), also taught at Columbia.[9] Barr's father was Jewish and raised in Judaism but later converted to Christianity and joined the Catholic Church. His mother is of Irish ancestry. Barr was raised as a Catholic.[10][11] Barr was the second of four sons, and his younger brother Stephen Barr is a professor of physics at the University of Delaware.[12]
Barr grew up on New York City's Upper West Side. As a child he attended a Catholic grammar school, Corpus Christi School, and then the non-sectarian Horace Mann School. After high school, he attended Columbia University, where he majored in government and graduated with a Bachelor of Arts in 1971. He did two additional years of graduate study at Columbia, receiving an Master of Arts in government and Chinese studies in 1973. While at Columbia, Barr opposed anti-Vietnam War occupation protests by students on campus.[13]
Barr moved to Washington, D.C., to work as an intelligence analyst for the CIA while taking evening classes at George Washington University Law School, graduating in 1977 with a Juris Doctor with highest honors.[14][15]
Career
Early career
Barr with President Ronald Reaganin the Oval Office in 1983
From 1971 to 1977, while attending graduate school and law school, Barr worked for the Central Intelligence Agency (CIA).[16] He was first hired as a summer intern for two years.[13] During his law school years he was an analyst in the Intelligence Directorate division from 1973 to 1975, and then transitioning to an assistant in the Office of Legislative Counsel and an agency liaison to Congress from 1975 to 1977.[16][17][18][19]
After graduating from law school in 1977, Barr spent one year as a law clerk to Judge Malcolm Wilkey of the U.S. Court of Appeals for the D.C. Circuit.[20][14] He then joined the law firm of Shaw, Pittman, Potts & Trowbridge (now Pillsbury Winthrop Shaw Pittman) from 1978 to 1982 and again from 1983 to 1989,[20] after serving as Deputy Assistant Director for Legal Policy on the domestic policy staff at the Reagan White House from May 1982 to September 1983.[20][14][21]
U.S. Department of Justice
Barr and Dan Quayle watch as President George H. W. Bush signs the Civil Rights Commission Reauthorization Act in the Rose Garden of the White House in 1991.
In 1989, at the beginning of his administration, President George H. W. Bush appointed Barr to the U.S. Department of Justice as Assistant Attorney General for the Office of Legal Counsel (OLC), an office which functions as the legal advisor for the President and executive agencies. Barr was known as a strong defender of presidential power.[22] He wrote an advisory opinion justifying the U.S. invasion of Panama and arrest of Manuel Noriega.[22] He wrote legal justifications for the practice of rendition,[23] so that the FBI could enter onto foreign soil without the consent of the host government to apprehend fugitives wanted by the United States government for terrorism or drug-trafficking.[22] Barr declined a congressional request for the full 1989 opinion, but instead provided a document that "summarizes the principal conclusions". Congress subpoenaed the opinion, and its public release after Barr's departure from the Justice Department showed he had omitted significant findings in the opinion from his summary document.[24]
U.S. Deputy Attorney General (1990–1991)
In May 1990, Barr was appointed Deputy Attorney General, the official responsible for day-to-day management of the Department. According to media reports, Barr was generally praised for his professional management of the Department.[25][26][27]
During August 1991, when then-Attorney General Richard Thornburgh resigned to campaign for the Senate, Barr was named Acting Attorney General.[28] Three days after Barr accepted that position, 121 Cuban inmates, awaiting deportation to Cuba, seized nine hostages at the Talladega federal prison. He directed the FBI's Hostage Rescue Team to assault the prison, which resulted in rescuing all hostages without loss of life.[29][30]
U.S. Attorney General (1991–1993)
Official photo of Barr during his first tenure as Attorney General
First nomination and confirmation
It was reported that President Bush was impressed with Barr's management of the hostage crisis; weeks later, Bush nominated him as Attorney General.[31]
Barr enjoyed a "sterling reputation" among Republican and Democratic politicians alike.[32] His two-day confirmation hearing was "unusually placid", and he was received well by both Republicans and Democrats on the Senate Judiciary Committee.[33] Asked whether he thought a constitutional right to privacy included the right to an abortion, Barr responded that he believed the Constitution was not originally intended to create a right to abortion; that Roe v. Wade was thus wrongly decided; and that abortion should be a "legitimate issue for state legislators".[33] "Barr also said at the hearings that Roe v. Wade was 'the law of the land' and claimed he did not have 'fixed or settled views' on abortion."[34] Senate Judiciary Committee Chair Joe Biden, though disagreeing with Barr, responded that it was the "first candid answer" he had heard from a nominee on a question that witnesses would normally evade; Biden hailed Barr as "a throwback to the days when we actually had attorneys general that would talk to you."[35] Barr was approved unanimously by the Senate Judiciary Committee, was confirmed by voice vote by the full Senate,[36][37] and was sworn in as Attorney General on November 26, 1991.[38]
First tenure
During his first tenure as AG, media characterized Barr as "a staunch conservative who rarely hesitates to put his hardline views into action."[39][40][41] He was described as affable with a dry, self-deprecating wit.[39][42] The New York Times described the "central theme" of his tenure to be "his contention that violent crime can be reduced only by expanding Federal and state prisons to jail habitual violent offenders."[40] In an effort to prioritize violent crime, Barr reassigned three hundred FBI agents from counterintelligence work to investigations of gang violence. The New York Times called this move "the largest single manpower shift in the bureau's history."[40]
During the 1992 election year, the Wall Street Journal wrote of Barr's work that he "has put a heavy emphasis on attention-grabbing events and pronouncements that may have more to do with presidential election-year politicking than with fighting crime on the streets."[43]
The Case for More Incarceration
The Case for More Incarceration
In 1992, Barr authored a report, The Case for More Incarceration,[44] which argued for an increase in the United States incarceration rate, the creation of a national program to construct more prisons, and the abolition of parole release.[4] Barr argued that incarceration reduced crime, pointing to crime and incarceration rates in 1960, 1970, 1980 and 1990. A 1999 criminology study criticized Barr's analysis, saying "so complex an issue as the relationship between crime and punishment cannot be addressed through so simplistic an analysis as a negative correlation between the two very aggregated time series of crime rates and incarceration rates."[45] University of Minnesota criminologist Michael Tonry said the data in Barr's report was deceptively presented; if Barr had chosen five-year intervals, then the data would not have supported Barr's argument, and if Barr had chosen to look at violent crime specifically (as opposed to all crimes as a category), then the data would not have supported his argument.[46]
Barr said in the report, "The benefits of increased incarceration would be enjoyed disproportionately by black Americans".[46] In the report, Barr approvingly quoted New Mexico Attorney General Hal Stratton, "I don't know anyone [who] goes to prison on their first crime. By the time you go to prison, you are a pretty bad guy."[47] Barr's report influenced the Violent Crime Control and Law Enforcement Act of 1994, which aimed to increase the incarceration rate.[4]
Investigations
In October 1991, Barr appointed then-retired Democratic Chicago judge Nicholas Bua as special counsel in the Inslaw scandal. Bua's 1993 report found the Department of Justice guilty of no

In October 1991, Barr appointed then-retired Democratic Chicago judge Nicholas Bua as special counsel in the Inslaw scandal. Bua's 1992 report found the Department of Justice guilty of the wrongdoing in the matter.[48]

In October 1992, Barr appointed then retired New Jersey federal judge Frederick B. Lacey to investigate the Department of Justice and the Central Intelligence Agency handling of the Banca Nazionale del Lavoro (BNL) Iraqgate scandal.[49] The appointment came after Democrats called for a special prosecutor during the scandal fearing a "cover-up" by the administration. House Banking Committee Chairman Henry B. González called for Barr's resignation, citing "repeated, clear failures and obstruction" by the Department of Justice in allegedly delaying an investigation of the BNL-Iraqgate case.[50][51] González also called for an independent special counsel investigation.[51]

Phone surveillance program

In 1992, Barr launched a surveillance program to gather records of innocent Americans' international phone calls.[52] The DoJ inspector general concluded that this program had been launched without a review of its legality.[52] According to USA Today, the program "provided a blueprint for far broader phone-data surveillance the government launched after the terrorist attacks of Sept. 11, 2001."[52]

In December 2019, Democratic Senators Ron Wyden and Patrick J. Leahy asked the Justice Department's Office of Professional Responsibility to investigate Barr for approving an illegal surveillance program without legal analysis.[53]

Iran-Contra

In late 1992, Independent Counsel Lawrence Walsh, who had been chosen to investigate the Iran–Contra affair, found documents in the possession of Reagan's former defense secretary, Caspar Weinberger, which Walsh said was "evidence of a conspiracy among the highest-ranking Reagan Administration officials to lie to Congress and the American public."[54][55] Weinberger was set to stand trial on felony charges on January 5, 1993.[54][56] His "indictment said Mr. Weinberger's notes contradicted Mr. Bush's assertions that he had only a fragmentary knowledge of the arms secretly sold to Iran in 1985 and 1986 in exchange for American hostages in Lebanon."[56][55][57] According to Walsh, then-president Bush might have been called as a witness.[58]

On December 24, 1992, during his final month in office, Bush, on the advice of Barr, pardoned Weinberger,[14][59] along with five other administration officials who had been found guilty on charges relating to the Iran–Contra affair.[14][60][61][54] Barr was consulted extensively regarding the pardons, and especially advocated for pardoning Weinberger.[62]

Walsh complained about the move insinuating that Bush on Barr's advice had used the pardons to avoid testifying and stating that: "The Iran-contra cover-up, which has continued for more than six years, has now been completed."[63] In 2003, he wrote an account of the investigation in his book, Firewall: The Iran-Contra Conspiracy and Cover-Up.

Because of this and Barr's unwillingness to appoint an independent counsel to look into a second scandal known as Iraqgate, New York Times writer William Safire began to refer to Barr as "Coverup-General Barr."[64] Barr, however, responded that he believed Bush had made the right decision regarding that and he felt people in the case had been treated unfairly.[65] Barr said Walsh was a "head-hunter" who "had completely lost perspective."[2]

Post-DOJ career

Upon leaving the DOJ in 1993, Barr was appointed by Virginia Governor George Allen to co-chair a commission to implement tougher criminal justice policies and abolish parole in the state.[66][67] Barr has been described as a "leader of the parole-abolition campaign" in Virginia.[68]

After leaving the DOJ, he criticized the Clinton administration for being "soft on crime".[69] Barr expressed his opposition to efforts to end mandatory minimum sentencing.[69] In a 1993 op-ed, he wrote, "The notion that there are sympathetic people out there who become hapless victims of the criminal-justice system and are locked away in federal prison beyond the time they deserve is simply a myth."[70][69] In a 1995 essay, Barr rejected that crime was caused by material factors, such as poverty, arguing instead that crime was caused by immorality: "Spending more money on these material social programs is not going to have an impact on crime, and, if anything, it will exacerbate the problem."[70]

In 1994, Barr became Executive Vice President and General Counsel of the telecommunications company GTE Corporation, where he served for 14 years. During his corporate tenure, Barr directed a successful litigation campaign by the local telephone industry to achieve deregulation by scuttling a series of FCC rules, personally arguing several cases in the federal courts of appeals and the Supreme Court.[71][72] In 2000, when GTE merged with Bell Atlantic to become Verizon Communications, Barr became the general counsel and executive vice president of Verizon until he retired in 2008.[73] Barr became a multimillionaire from working in GTE and Verizon. In 2001, Barr's salary was reportedly $1.5 million.[13]

From 1997 to 2000, Barr served on the Board of Visitors of the College of William & Mary in Williamsburg.[74]

In 2009, Barr was briefly of counsel to the firm Kirkland & Ellis. From 2010 until 2017, he advised corporations on government enforcement matters and regulatory litigation; he rejoined Kirkland and Ellis in 2017.[75]

From 2009 to 2018, Barr served on the board of directors for Time Warner.[76]

Comments about the Starr investigation of President Clinton

In March 1998, Barr lambasted the Clinton administration for criticizing Independent Counsel Ken Starr's investigation of the Whitewater controversy, which had shifted towards an investigation of an alleged affair between Clinton and Monica Lewinsky.[2] Barr said the criticism appeared "to have the improper purpose of influencing and impeding an ongoing criminal investigation and intimidating possible jurors, witnesses and even investigators."[2]

Comments about the Trump administration

On April 18, 2019, a redactedversion of Report on the Investigation into Russian Interference in the 2016 Presidential Election was released to the public.

During the first two years of the Trump presidency, Barr frequently criticized legal challenges against Trump and investigations into the Trump 2016 campaign and presidency.[77][78]

In 2017, Barr said there was "nothing inherently wrong" with Donald Trump's calls for investigating Hillary Clinton while the two were both running for president. Barr added that an investigation into an alleged Uranium One controversy was more warranted than looking into whether Trump conspired with Russia to influence the 2016 elections.[79] Barr also said in 2017 that he didn't think "all this stuff" about incarcerating or prosecuting Hillary Clinton was appropriate to say, but added that "there are things that should be investigated that haven't been investigated," although the FBI began investigating the Clinton Foundation and the related Uranium One matter in 2015, followed by investigations by Republican congressional committees.[80][81][82]

In February 2017, Barr argued Trump was justified in firing Acting Attorney General Sally Yates over her refusal to defend Executive Order 13769.[83]

Barr was publicly critical of the special counsel investigation. In 2017, he faulted Mueller for hiring prosecutors who have contributed to Democratic politicians, saying that his team should have had more "balance," and characterized the obstruction of justice investigation as "asinine" and that it was "taking on the look of an entirely political operation to overthrow the president."[84][85]

In June 2018, Barr sent an unsolicited 20-page memo to senior Justice Department officials. He also provided copies to members of Trump's legal team and discussed it with some of them.[86] In his memo, Barr argued that the Special Counsel should not be investigating Trump for obstruction of justice because Trump's actions, such as firing FBI Director James Comey, were within his powers as head of the executive branch.[87][88][89] He characterized the obstruction investigation as "fatally misconceived" and "grossly irresponsible" and "potentially disastrous" to the executive branch.[90][91]

The day after the existence of the memo became known, Deputy Attorney General Rod Rosenstein said "our decisions are informed by our knowledge of the actual facts of the case, which Mr. Barr didn't have."[92]Democrats later characterized the memo as Barr's "job application" for the Attorney General position.[93]

Political donations

The National Republican Senatorial Committee (NRSC) financially assists Republicans in their Senate election contests; in the seven years from 2009 to 2016, Barr gave six donations to the NRSC totaling $85,400. In a five-month period from October 2018 to February 2019, Barr donated five times (around $10,000 every month) for a total of $51,000. When Barr started donating more frequently to the NRSC, it was uncertain whether then-Attorney General Jeff Sessions would remain in his job. Barr continued donating even after Sessions resigned, and after Trump nominated Barr for Attorney General. The donations stopped after Barr was confirmed by the Senate as Attorney General. NRSC refunded Barr $30,000 before his confirmation. Previously in 2017, Barr had said he felt "prosecutors who make political contributions are identifying fairly strongly with a political party".[94]

U.S. Attorney General (2019–present)

Barr is sworn in as Attorney General by Chief Justice John Roberts in 2019.

Second nomination and confirmation

On December 7, 2018, President Donald Trump announced Barr's nomination to succeed Jeff Sessions.[95][96] Michael Isikoff and Daniel Klaidman reported that Trump had sought Barr as chief defense lawyer for Trump regarding the special counsel investigation headed by Robert Mueller after Barr made three positions known. First, Barr supported Trump's firing of Comey on May 9, 2017. Second, he questioned the appointments of some of Mueller's prosecutors due to political donations they had made to the Clinton campaign. Third, he alleged there were conflicts of interest of two appointees to the Special Counsel Team, Jennie Rheeand Bruce Ohr.[97][98][99]

Barr meets with the Justice Department leadership.

Barr was confirmed as Attorney General on February 14, 2019, by a 54–45 near party-line vote, with Sen. Doug Jones (D-AL), Joe Manchin (D-WV), and Kyrsten Sinema (D-AZ) as the three Democrats to vote Yea. Republican senator Rand Paul (R-KY) voted No and Richard Burr (R-NC) did not vote.[100][101] Later that day, Barr was sworn-in as the nation's 85th Attorney General by Chief Justice John Roberts in a ceremony at the White House.[102] He is the first person to be appointed to a second non-consecutive term as Attorney General since John J. Crittenden in 1850.[103]

Second tenure

In May 2019, three months into his tenure as Attorney General, the Associated Press characterized Barr as a champion and advocate for Trump.[104] Barr had enthusiastically supported Trump's political agenda, misrepresented aspects of Special Counsel Robert Mueller's report, repeated Trump's talking point that those investigating Trump had engaged in "spying", defied congressional subpoenas, and refused to give Congress an unredacted version of the Mueller report.[104]

Under Barr's leadership, the Justice Department changed its position on the Affordable Care Act (ACA). Previously the department took the position that the individual mandate provision was unconstitutional, but could be severed from the whole healthcare law. On March 25, the department updated its position to argue that the entire law is unconstitutional.[105] On May 2, the department conducted a filing with the United States Court of Appeals for the Fifth Circuit to nullify the entire law, arguing that the removal of the provision on individual mandate results in the entire law becoming unconstitutional.[106]

On May 1, 2019, Assistant Attorney General Stephen Boyd told the House Oversight Committee that Barr had instructed Justice Department official John Gore to refuse a subpoena to testify in front of the committee. The committee subpoenaed Gore over the Trump administration's efforts to add a question on citizenship to the 2020 United States Census. The reason for the refusal was that the committee's decision to not allow a Justice Department lawyer to accompany Gore during testimony violated "the confidentiality interests of the Executive Branch" (though a separate room was permitted).[107] In early June the House Oversight Committee moved to hold Barr in contempt of congress for defying a subpoena regarding the efforts to add a citizenship question to the census.[108]

In July 2019, the House of Representatives voted 230–198 to hold Barr (and Commerce Secretary Wilbur Ross) in criminal contempt of Congress, after they failed to produce documents as April 2019 congressional subpoenas mandated. The documents, on the planned (and eventually scrapped) citizenship question in the 2020 census, were withheld due to a "deliberative process" and "attorney-client communications", according to the Justice Department. President Trump also asserted executive privilege over the documents to withhold them from Congress. Only once prior has a sitting Cabinet member been held in criminal contempt of Congress (Eric Holder in 2012). The House instructed the Justice Department to prosecute Barr, but the Department refused.[109][110]

Also in July 2019, Barr reportedly made the decision to not bring federal civil rights charges against New York policeman Daniel Pantaleo for causing the death of Eric Garner. In so doing, he overruled the Justice Department's Civil Rights Division, which advocated charging Pantaleo, instead agreeing with Justice Department prosecutors from New York.[111]

On July 25, 2019, Barr reinstated the death penalty for federal crimes.[112]

In December 2019, Barr said that communities that do not show the "respect and support that law enforcement deserves ... might find themselves without the police protection they need."[113] Barr dropped the Department of Justice's case against the police officer who killed Eric Garner in 2014.[13]

In February 2020, Senator Lindsey Graham stated that the Justice Department "is receiving information coming out of the Ukraine from" Rudy Giuliani, a personal lawyer to president Donald Trump. Graham had learned from Barr that "they've created a process that Rudy could give information and they would see if it's verified". A day later, Barr confirmed Graham's account, stating that he had "established an intake process" for information on Ukraine, including from Giuliani, while citing an "obligation to have an open door" policy on receiving information. Giuliani has claimed to have information of improprieties regarding Ukraine for Joe Biden (a former vice president, later a 2020 presidential candidate) and his son Hunter Biden. Giuliani himself is reportedly being investigated by the Justice Department, with two of his associates having been arrested.[114][115][116]

In early June 2020, according to reporting by The Washington Post and Fox News, Barr personally ordered that the streets around Lafayette Square, Washington, D.C. should be cleared so that Trump, Barr and other administration officials could stage a photo op in front of St. John's Church. At the time, the streets were occupied by peaceful protesters as part of the George Floyd protests in Washington, D.C. Barr's order resulted in federal law enforcement officers rushing protesters, and employing smoke canisters, pepper balls, riot shields, and batons against the protesters.[117][118]

Barr reacted to the incident by falsely claiming that pepper balls (used by law enforcement on protesters) were not chemical irritants (pepper balls contain pelargonic acid vanillylamide, a chemical irritant; while the product's manufacturer, and the Justice Department, both consider pepper balls a chemical irritant).[119] In August 2020, he invoked qualified immunity before a federal court to protect himself from liability in a lawsuit regarding the Lafayette Square incident.[120]

As Attorney General, Barr sowed doubt about the integrity of the 2020 election.[121] In a September 2020 interview, Barr falsely asserted the Justice Department had indicted a Texas man for fraudulently completing 1,700 mail-in ballots. There was no such indictment, and the matter actually involved a series of errors by election officials during a county election, rather than fraud.[122] Barr also repeated a claim that foreign adversaries could flood the country with counterfeit ballots to disrupt the election, a threat that experts characterized as nearly impossible to execute.[123][124] Senior American intelligence officials have said there was no evidence any foreign powers intended to manipulate mail-in voting.[125] The day after Barr's interview, the Department of Homeland Security issued an intelligence bulletin warning that Russia is using social media and other venues to promote false claims that mail voting will lead to widespread fraud, in order "to undermine public trust in the electoral process."[126] In a subsequent September 2020 interview, Barr stated that mail-in voting meant "we're back in the business of selling and buying votes" including "outright coercion, paying off a postman, here's a few hundred dollars, give me some of your ballots."[127] On October 1, 2020, more than 1,600 former DOJ attorneys signed an open letter stating, "we fear that Attorney General Barr intends to use the DOJ's vast law enforcement powers to undermine our most fundamental democratic value: free and fair elections."[128]

In mid-June 2020, Barr announced that Geoffrey Berman, the court-appointed United States Attorney for the Southern District of New York (SDNY), "is stepping down". Berman's office had been investigating both Trump's personal lawyer Rudy Giuliani and Trump's inaugural committee, as well as conducting a wider investigation into Trump's company and his associates after successfully prosecuting Michael Cohen, another personal lawyer of Trump.[129] CNN also reported that Berman had prosecuted Halkbank despite Barr's attempt to try to avoid charges for the Turkish state-owned bank, after Turkish president Recep Tayyip Erdoğan requested Trump to help drop the charges.[130][131][132][133] Simultaneously, Barr announced that at his recommendation, Trump had

owned bank, after Turkish president Recep Tayyip Erdoğan requested Trump to help drop the charges. [illegible] Simultaneously, Barr announced that at his recommendation, Trump had appointed Craig Carpenito as the interim SDNY U.S. Attorney, in a departure from the tradition of a career prosecutor from SDNY taking the interim role. Also concurrently, Barr said that Trump would nominate Jay Clayton for the permanent role of SDNY U.S. Attorney.[130][131] Within a day, Berman said that he actually had "not resigned, and have no intention of resigning". Berman also said that he only learned of his supposed departure from Barr's public announcement.[131][132] Barr then informed Berman that Trump had fired Berman at Barr's request. Barr did not give a reason for Berman's firing. As a result of the firing, the deputy SDNY U.S. Attorney, Audrey Strauss, would become the interim SDNY U.S. Attorney. With this, Berman agreed to leave. Meanwhile, the Senate indicated it would not confirm Clayton as the permanent replacement.[133][132]

Barr has made commentary about social and religious issues in speeches and television appearances. In an October 2019 address at the University of Notre Dame, Barr asserted that "militant secularists" had been attacking Judeo-Christian values for five decades, stating, "This is not decay. This is organized destruction. Secular forces and their allies have marshaled all the forces of mass communication, popular culture, the entertainment industry, and academia, in an unremitting assault on religion and traditional values."[134] In an August 2020 appearance on Fox News, Barr asserted that Black Lives Matter is "a revolutionary group that is interested in some form of socialism, communism. They're essentially Bolsheviks. Their tactics are fascistic." Barr equated the movement with antifa, characterizing that loose collective as "highly organized" and claiming "the media doesn't take footage of what's happening" at George Floyd protests. He also claimed that liberals are intent on "tearing down the system" and that the Democratic party was only "interested in total victory. It's a secular religion. It's a substitute for a religion."[135] Barr had in June 2020 blamed antifa for orchestrating the George Floyd protests, but analysis by The New York Times found that no one arrested for serious federal crimes at the protests had been linked to antifa.[136] Homeland Security Departmentsecretary Chad Wolf said in September 2020 that he and Barr had discussed arresting leaders of antifa and the Black Lives Matter movement.[137] The Wall Street Journal reported in September 2020 that Barr told federal prosecutors to consider charging violent protestors with plotting to overthrow the US government.[138][139]

Barr has sometimes supported controversial or false statements made by Trump.[140] In an August 2020 interview, Trump claimed that a plane full of "thugs in dark uniforms", implying antifa, had recently flown from one unidentified city to another with the intention of fomenting riots. His claim appeared to be based on months-old social media rumors.[141][142] Two days later, Barr asserted he knew that antifa activists "are flying around the country" and "we are following them."[143]

In September 2020, Barr asserted liberals were "projecting," referring to "all this bullshit about how the president is going to stay in office and seize power? I've never heard of any of that crap. I mean, I'm the attorney general. I would think I would have heard about it." During both the 2016 and 2020 campaigns, Trump was noncommittal when asked if he would accept election results showing he had lost. Days after Barr's remarks, Trump was asked if he would commit to a peaceful transition of power if he lost the 2020 election, to which he replied, "Well, we'll have to see what happens. You know that I've been complaining very strongly about the ballots. And the ballots are a disaster. Get rid of the ballots and you'll have a very peaceful — there won't be a transfer, frankly. There will be a continuation."[144][145][127][146] In the days after his electoral defeat, Trump and his legal team led by Rudy Giuliani pursued an aggressive effort to challenge the results with dozens of lawsuits and numerous false and unsubstantiated assertions revolving around an international communist conspiracy, rigged voting machines and polling place fraud to claim the election had been stolen from Trump.[147][148][149][150][151]

On September 3, 2020, Trump ordered Barr to identify "anarchist jurisdictions," stating in a memorandum, "It is imperative that the federal government review the use of federal funds by jurisdictions that permit anarchy, violence, and destruction in America's cities."[152] Days later, Barr designated New York City, Seattle and Portland, Oregon as such jurisdictions, suggesting they should lose their federal funding because, "We cannot allow federal tax dollars to be wasted when the safety of the citizenry hangs in the balance."[153]

As baseless claims of voting fraud circulated in the aftermath of the 2020 presidential election in which Trump lost,[154] Barr sent a memo to DOJ prosecutors authorizing them to investigate "vote tabulation irregularities" before voting results had been certified, a reversal of long-standing department policy. Richard Pilger, director of the Election Crimes Branch at the DOJ Criminal Division, stepped down from that position in protest hours later.[155] Four days later, sixteen assistant U.S. attorneys of the Branch wrote Barr a letter urging him to rescind the memo because it "thrusts career prosecutors into partisan politics."[156]

Mueller investigation and report

Further information: Special Counsel investigation (2017–2019) and Mueller Report

On January 14, 2019, a day before Barr's confirmation hearing for Attorney General, Barr sent written testimony to the Senate Judiciary Committee regarding the eventual final Mueller report, saying "it is very important that the public and Congress be informed of the results of the special counsel's work ... For that reason, my goal will be to provide as much transparency as I can consistent with the law."[157][158]

Upon taking office, Barr refused calls to recuse himself from overseeing the Mueller investigation, despite his June 2018 memo arguing that the special counsel had no right to investigate Trump.[87][21]

On March 22, 2019, Mueller concluded his special counsel investigation and gave the final report to Barr.[159] On March 24, Barr wrote a four-page letter to Congress describing what he said were the report's principal conclusions: first, that the Special Counsel did not establish conspiracy or coordination between the Trump campaign and Russia's efforts to interfere with the 2016 election; and second, that the Special Counsel made no decision as to whether to prosecute Trump for obstruction of justice, quoting "while this report does not conclude that the President committed a crime, it also does not exonerate him." Barr and Deputy Attorney General Rosenstein themselves concluded that the evidence did not establish obstruction of justice beyond reasonable doubt, and made the decision not to press the charge; "Deputy Attorney General Rod Rosenstein and I have concluded that the evidence developed during the Special Counsel's investigation is not sufficient to establish that the President committed an obstruction-of-justice offense."[160][161][162][163]

On March 25, Mueller reportedly wrote a letter to Barr, as described in the New York Times as "expressing his and his team's concerns that the attorney general had inadequately portrayed their conclusions".[164] In USA Today it was described that Mueller "expressed his differences with Barr".[165]

On March 27, Mueller sent Barr another letter describing his concerns of Barr's letter to Congress and the public on March 24. In it, Mueller complained that the summary "did not fully capture the context, nature, and substance" of the Special Counsel's probe, adding, "There is now public confusion about critical aspects of the results of our investigation. This threatens to undermine a central purpose for which the Department appointed the Special Counsel: to assure full public confidence in the outcome of the investigations".[166] Both before and after the release of Barr's summary, Mueller repeatedly tried to get Barr to release the report's introductions and executive summaries. Mueller's March 27 letter also stated that he had earlier sent a March 25 letter to Barr.[167]

Mueller's March 27 letter prompted Barr to call Mueller on March 28. Barr clarified on the intention of his letter both in his phone call with Mueller and in another letter to Congress that his letter had not been intended to be a summary of the report, but rather a description of the principal findings of the report.[168][166]

On April 9, Barr appeared in a congressional hearing before the House. There, Representative Charlie Crist described media reports that "members of the special counsel's team are frustrated at some level with the limited information included in your March 24 letter, that it does not adequately or accurately portray the [Mueller] report's findings". Crist asked Barr: "Do you know what they are referencing with that?" Barr replied: "No, I don't. I think – I think – I suspect that they probably wanted more put out, but in my view, I was not interested in putting out summaries."[169][170] On April 10, Attorney General Barr appeared before the Senate Appropriations Committee. Senator Chris Van Hollen asked Barr regarding obstruction: "Did Bob Mueller support your conclusion?" Barr replied: "I don't know whether Bob Mueller supported my conclusion."[169][170]

The Department of Justice released a redacted version of the special counsel's report in the morning of April 18, 2019.[171][172] After the release of the full report, fact-checkers and news outlets characterized Barr's initial letter as a deliberate mischaracterization of the Mueller Report and its conclusions.[173][174][175][176][177][178] The New York Times reported instances in which the Barr letter omitted information and quoted sentence fragments out of context in ways that significantly altered the Mueller findings, including:[173]

- A sentence fragment described only one possible motive for Trump to obstruct justice, while the Mueller report listed other possible motives
- Omission of words and a full sentence that twice suggested there was knowing and complicit behavior between the Trump campaign and Russians that stopped short of coordination
- Omission of language that indicated Trump could be subject to indictment after leaving office, to suggest that Trump was cleared in full

According to the Associated Press, Barr misrepresented the report in several ways, saying the report gave no indication that Congress could make a determination on obstruction of justice (the report specifically stated "that Congress may apply obstruction laws") and that "these reports are not supposed to be made public" (when DOJ regulations give the AG wide authority in releasing reports such as this one).[179] Barr falsely claimed in his summary of the report that "the White House fully cooperated with the Special Counsel's investigation."[180] The Washington Post fact-checker described Barr's claim as "astonishing"[174] and PolitiFact said it was "false."[180] In actuality, Trump declined to grant the Special Counsel an in-person interview, and the Special Counsel report characterized Trump's written responses to interview questions as "inadequate".[180] The report also documented numerous instances where Trump tried to either impede or end the Special Counsel investigation, analyzing each in terms of the three factors necessary for a criminal charge of obstruction.[180][181][182][failed verification]

During a press conference, Barr said Mueller's report contained "substantial evidence" that Trump was "frustrated and angered" because of his belief that the "investigation was undermining his presidency, propelled by his political opponents, and fueled by illegal leaks"; however, the report gave no indication that Trump's frustrations with the investigation would mitigate obstructing behavior.[167][183][184] Barr also said it would not be criminal obstruction of justice for a president to instruct a staffer to lie to investigators about the president's actions,[185] and suggested a president could legally terminate an investigation into himself if he was being "falsely accused".[186]

On May 8, 2019, the House Judiciary Committee voted along party lines to hold Barr in contempt of congress for failing to comply with a subpoena which requested the full and unredacted Mueller Report.[187] The matter then fell to the House of Representatives at-large for a contempt of Congress vote.[188] The Justice Department took the position that disclosure of the unredacted Mueller Report would require the department to violate "the law, court rules and court orders" as well as grand jury secrecy rules.[187]

During May 1, 2019, testimony before the Senate Judiciary Committee, Barr stated he accepted Mueller's interpretation of the law that was applied in the Report. However, in a May 30 CBS News interview, Barr said he had applied his own interpretation of the law and took the position that obstruction laws cannot apply to presidents who abuse their official powers to impede an investigation for a corrupt reason. Barr elaborated: "As a matter of law ... we didn't agree with the legal analysis - a lot of the legal analysis in the report. It did not reflect the views of the department".[189][190]

In March 2020, Reggie Walton, a federal district judge originally appointed by President George W. Bush, criticized Barr's characterizations of the Mueller report as "distorted" and "misleading". Walton made his comments while presiding over a lawsuit on whether the Mueller report should be released without redactions. As Walton saw it, Barr's "lack of candor" undermined Barr's "credibility and, in turn, the department's" arguments before the court. Walton had concerns that Barr may have made a "calculated attempt to influence public discourse" in favor of President Trump by establishing "a one-sided narrative" about the report contrary to the report's findings. Walton questioned if the report's redactions were actually "self-serving" to avoid conflict with Barr's statements, and if the Justice Department used "post-hoc rationalizations" to defend Barr. Thus, Walton decided to personally review the redacted material to check if the redactions were justified.[191][192] On September 3, Walton ruled that the redaction of FBI reports of witness interviews was proper.[193] On September 30, he ruled the DOJ had violated federal law by redacting some portions of the Mueller report and ordered them to be released before the November election.[194]

Intervention in cases of Trump associates

In the spring of 2019, Barr reportedly attempted to undermine the conviction of Trump fixer Michael Cohen for campaign finance violations, detailed The New York Times in June 2020. Barr reportedly raised doubts multiple times about the validity of the charges against Cohen, including requesting the Office of Legal Counsel to draft a memo with legal arguments which could have helped Cohen's case. Barr's efforts were reportedly stemmed by the prosecutors of the Southern District of New York. Ultimately, Cohen's conviction was not changed.[195]

In February 2020, President Trump directly referenced Barr in the Justice Department's intercession in recommending a lighter sentence for Trump's associate and old friend Roger Stone. Trump's tweet stated: "Congratulations to Attorney General Bill Barr for taking charge of a case that was totally out of control and perhaps should not have even been brought." Initially, four career prosecutors had recommended that Stone serve a jail term of between seven and nine years. A Trump tweet followed: "Cannot allow this miscarriage of justice!" - after which the Department recommended an unspecified jail term. The Department claimed that this later decision was made without consulting the White House. The prosecutors resigned from the case as a result, with one choosing to leave the Department.[196][197]

Barr affirmed that he had made the decision in the Stone case to change the sentencing memo. Barr said Trump had not asked him to step in, but noted that Trump's tweets and public comments make it impossible for the attorney general to do his job. "I think it's time to stop the tweeting about Department of Justice criminal cases," Barr said.[198][199] Barr's rebuke of Trump's use of Twitter for interference in DOJ matters were seen as a rare departure from his usual unwavering support of the president. Barr's comments followed criticism of the department for its poor handling of the sentencing of Roger Stone after DOJ actions seen as favorable to Trump and his allies.[200][201] Days later, more than 2,000 former DOJ employees signed a letter calling for Barr's resignation.[202] while the Federal Judges Association of over 1,000 federal jurists called an emergency meeting for February 18 to discuss their concerns about the intervention of Trump and Justice Department officials in politically sensitive cases.[203] Despite Barr's rebuke of Trump, days later the president resumed denouncing the prosecutors, the judge, and the jury foreperson in the Stone case, while acknowledging that his comments made Barr's job harder.[204] After granting several pardons, Trump also labeled himself as the country's "chief law enforcement officer", a description usually reserved for the attorney general.[205]

Additionally in February 2020, Barr declared that there would be a review of the criminal case of Michael Flynn, the former National Security Advisor to Trump, who had pled guilty in 2017 to lying to the FBI about his contacts with a Russian ambassador. Flynn later attempted to withdraw his guilty plea, and had not been sentenced yet.[206][207] Barr chose St. Louis' chief federal prosecutor, Jeffrey Jensen, to conduct the review. Jensen himself was nominated by Trump for the St. Louis position.[207] Trump had publicly called for the charges to be dropped against Flynn. In late April or early May, Jensen recommended to Barr that the charges be dropped.[208]

The Justice Department announced in May 2020 that the charges against Flynn would be dropped, with Jensen stating that Barr had agreed with his recommendation.[208] Shortly after, Barr was asked in a media interview if given that Flynn "admitted lying to the FBI. Does the fact remain that he lied?" Barr replied that "people sometimes plead to things that turn out not to be crimes ... the Department of Justice is not persuaded that this was material to any legitimate counterintelligence investigation. So it was not a crime." Barr denied that he was carrying out the president's agenda on this case, stating that he was "doing the law's bidding". He also said that from this case, he wanted to show Americans that "there's only one standard of justice", instead of two standards of justice.[209]

Barr's firing of Geoffrey Berman was widely condemned,[210][211] given that the Southern District of New York was actively pursuing criminal investigations into several persons and companies associated with President Donald Trump and The Trump Organization.[212][213][214][215] Barr's conduct was seen as sacrificing the independence of the Department of Justice to protect Trump and his allies.[216][217][218][219] For these reasons, numerous groups have called for Barr's resignation, including the New York City Bar Association.[220][221][222][223][224]

Ethics complaints

On October 3, 2019, Rep. Bill Pascrell Jr. filed ethics complaints against Barr with the District of Columbia Bar and Virginia Bar associations.[225] On February 14, 2020, Citizens for Responsibility and Ethics in Washington filed an ethics complaint against Barr with the Department of Justice Office of Professional Responsibility and Office of the Inspector General, accusing Barr of "violating [illegible]"[226] On July 23, 2020, [illegible] of 27 [illegible]

several Justice Department rules, guidelines and procedures.[226] On July 22, 2020, a group of 27 legal ethics experts and former government lawyers, including four former presidents of the District of Columbia Bar, also filed a complaint against Barr with the District of Columbia Bar.[227][228] A bar association may take years to investigate an ethics complaint filed against a lawyer.[227] If the District of Columbia Bar concludes that a lawyer has violated any of its Rules of Professional Conduct, that lawyer may be sanctioned in one of several ways, including admonition, suspension, and disbarment.[229]

Halkbank Investigation and the firing of Geoffrey Berman

In June 2019, in violation of Department of Justice policy, Barr pressured Berman, then the U.S. Attorney for the Southern District of New York, to drop an investigation into close allies of Turkish President Recep Tayyip Erdogan involved with the Turkish bank Halkbank.[6] The bank and the individuals in question were alleged to have broken U.S. sanctions on Iran, funnelling billion of dollars to Iran and helping fund its nuclear ambitions.[8] Barr's demand followed a concerted pressure campaign by Erdogan and his close associates, including his son-in-law, Turkish Finance Minister Berat Albayrak, and Mehmet Ali Yalcindag, a Trump family friend involved in developing the Trump towers in Turkey;[8] Erdogan himself personally insisted to President Trump that the Halkbank investigation be shut down on at least two occasions, November 1, 2018 at the G20 summit in Buenos Aires, and on a telephone call on December 14, 2018.[8] According to former National Security Adviser John Bolton, a first-hand witness of many of the events in question, this sequence of events "does look like obstruction of justice."[8] After encountering legal complexities in firing Berman, Barr successfully ousted Berman over the weekend of June 19–20, 2020, citing Berman's behavior in the Halkbank episode as a primary reason for his removal.[8]

Spying claims

Main article: Spygate (conspiracy theory)

In April 2019, Barr stirred controversy by saying he thought "spying did occur" against the Trump 2016 presidential campaign.[230] The remark echoed unsubstantiated claims made by Trump and his supporters that the Trump campaign had been unfairly targeted or spied on by the FBI; Trump described it as an "attempted coup."[231][230][232][233][234] There is no evidence that government officials engaged in "spying" on the Trump campaign.[232] Barr later said he was not sure what spying had occurred and he did clarify what he meant by "spying".[230] He also said he had no evidence of wrong-doing.[230][233] Democrats criticized Barr's statement as "incendiary", saying the statement was intended to please Trump and that the statement lacked credibility following Barr's misrepresentation of the Mueller report in March 2019.[230][232][233] Barr said he thought there was not "any pejorative connotation at all" to the term spying.[235] At the time, Barr said he would not launch an investigation into the origins of the FBI probe into Russian interference in the 2016 election.[232]

FBI officials denied Barr's claims about spying.[236] FBI Director Christopher A. Wray said he was unaware of any illegal surveillance by the FBI; he rejected the description of "spying".[237] Subsequently, Trump retweeted a far-right pundit who said the FBI had "no leadership" and that Wray was "protecting the same gang that tried to overthrow the president in an illegal coup".[238] Trump said Wray's statement was "ridiculous."[238] Former FBI Director James Comey rebutted Barr, saying "The FBI doesn't spy. The FBI investigates."[231]

In May 2019, Barr asserted, "Government power was used to spy on American citizens".[235] Barr did not identify the specific actions prior to the 2016 election that he considered spying.[235]

Origins of the Russia investigation

Main article: Russia investigation origins counter-narrative

Trump–Ukraine scandal

A request by U.S. President Donald Trump(right) to Ukrainian President Volodymyr Zelensky (left) to investigate Joe Biden and his son sparked the scandal.

- Also in May 2019, Barr appointed John Durham, the U.S. attorney in Connecticut, to oversee a DOJ probe into the origins of the FBI investigation into Russian interference.[238] The origins of the probe were already being investigated by the Justice Department's inspector general and by U.S. attorney John Huber, who was appointed in 2018 by Jeff Sessions.[238] Democrats criticized the decision, with Sen. Patrick Leahy saying, "Ordering a 3rd meritless investigation at the request of Trump is beneath the office he holds."[238] Trump ordered the intelligence community to cooperate with Barr's inquiry and granted Barr unprecedented full authority to declassify any intelligence information related to the matter.[239][240][241][242][243]
- In September 2019, Barr was reported to have been contacting foreign governments to ask for help in this inquiry, including personally traveling to the United Kingdom and Italy to seek information. At Barr's request Trump phoned the prime minister of Australia to request his cooperation.[244][245] Barr sought information related to a conspiracy theory that had circulated among Trump allies in conservative media asserting Joseph Mifsud was a Western intelligence operative who was allegedly directed to entrap Trump campaign advisor George Papadopoulos in order to establish a false predicate for the FBI to open an investigation into Russian interference in the 2016 United States elections. On October 2, 2019, Senator Lindsey Graham, a staunch Trump supporter and chairman of the Senate Judiciary Committee, wrote a letter to the leaders of Britain, Australia and Italy, asserting as fact that both Mifsud and Australian diplomat Alexander Downer had been directed to contact Papadopoulos. Joe Hockey, the Australian ambassador to the United States, sharply rejected Graham's characterization of Downer.[246][247] A former Italian government official told The Washington Post in October 2019 that during a meeting the previous month, Italian intelligence services told Barr they had "no connections, no activities, no interference" in the matter; Italian prime minister Giuseppe Conte later affirmed this.[248][249] One British official with knowledge of Barr's requests observed, "it is like nothing we have come across before, they are basically asking, in quite robust terms, for help in doing a hatchet job on their own intelligence services."[250] The Washington Post reported on November 22, 2019 that the Justice Department inspector general had aggressively investigated the allegation that Mifsud had been directed to entrap Papadopoulos, but found it was without merit. The Post also reported the inspector general found the opening of the FBI's Crossfire Hurricane investigation was legally and factually predicated.[251] The Post subsequently reported in December 2019 that Barr disagreed with the inspector general's conclusion that there was adequate evidence for the FBI to open its investigation.[252] The Post also reported in December 2019 that the inspector general asked Durham and several American intelligence agencies if there was evidence of a setup by American intelligence, but they replied there was none.[253]
- On October 24, 2019, two sources told The New York Times that the Durham inquiry had been elevated to a criminal investigation.[254] The Times reported on November 22 that the Justice Department inspector general had made a criminal referral to Durham regarding Kevin Clinesmith, an FBI attorney who had altered an email during the process of acquiring a wiretap warrant renewal on Carter Page, and that referral appeared to be at least part of the reason Durham's investigation was elevated to criminal status.[255] Barr rejected criticism by Democrats in Congress that the transitioned investigation was designed to provide support to Trump during his impeachment inquiry in the Trump–Ukraine scandal.[256][257] On August 14, 2020, Clinesmith pleaded guilty to a felony violation of altering an email used to maintain Foreign Intelligence Surveillance Act (FISA) warrants, having added the phrase "not a 'source'" to the original email.[258][259] Carter Page had a prior operational relationship with the CIA from 2008 to 2013.[260]
- In November 2019, Justice Department Inspector General Michael Horowitz concluded his investigation into the origins of the 2016 Russia probe, concluding that the investigation was not tainted by "political bias or improper motivation", and that the initial information gathered "was sufficient to predicate the investigation" given the "low threshold" for opening an investigation. Barr rejected the conclusions of the report, declaring that the investigation was started "on the thinnest of suspicions that, in [his] view, were insufficient to justify the steps taken." This also contradicted FBI director Chris Wray, who interpreted Horowitz's findings as the investigation having "appropriate predication and authorization".[261][262]
- In December 2019, Barr claimed in an interview with NBC News that the Russia investigation was "completely baseless" and said he believed the FBI's investigation may have been conducted in "bad faith".[263] Barr also refused to refute the debunked conspiracy theory of Ukrainian interference in the 2016 election during the interview.[263][264] In a subsequent interview on Fox News, Barr asserted, "the president bore the burden of probably one of the greatest conspiracy theories — baseless conspiracy theories — in American political history," despite the recent inspector general report debunking several conspiracy theories Trump and his allies had promoted.[265][266][267][268]
- In January 2020, Barr prohibited the start of counterintelligence investigations related to presidential campaigns unless both the Attorney General and head of the FBI signed off on those investigations.[269]
- Barr defended Trump's April 2020 firing of intelligence community inspector general Michael K. Atkinson. Atkinson was the inspector general who sought to get the Trump administration to the disclose the Ukraine scandal whistleblower complaint to Congress. In defense of the firing, Barr allegedly made numerous false claims about Atkinson's actions during his tenure.[270]
- On May 18, 2020, Barr commented on prior investigations into potential collusion between Trump and Russia stating: "What happened to the president in the 2016 election and throughout the first two years of his administration was abhorrent…it was a grave injustice and it was unprecedented in American history…the law enforcement and intelligence apparatus of this country were involved in advancing a false and utterly baseless Russian collusion narrative against this president".[5][6]
- Barr hinted in June 2020 that the Durham investigation would produce results regarding the "complete collapse of the Russiagate scandal" before the end of the summer.[271] In July he told a Congressional committee that the results of the investigation could be released before the election, despite an informal Justice Department rule limiting release of such information.[272] In August, Trump in public comments appeared to be getting impatient for the investigation to produce more prosecutions and suggesting that his opinion of Barr will be negatively influenced if it doesn't.[272] As summer ended there were reports that Barr was pressing for the Durham investigation to release its report. Colleagues of Durham have said they believe he is under pressure to produce something before the election. A top aide in the investigation quietly resigned on September 10; she gave no reason, but colleagues said she was concerned about political pressure from Barr.[273] On September 18, 2020, four chairs of Democratic committees asked the DOJ inspector general to open an emergency investigation because "We are concerned by indications that Attorney General Barr might depart from longstanding DOJ principles to take public action related to U.S. Attorney Durham's investigation that could impact the presidential election," adding that Barr's public comments may have already violated that policy.[274]
- On November 2, 2020, the day before the presidential election, New York magazine reported that:
…there has been no evidence found, after 18 months of investigation, to support Barr's claims that Trump was targeted by politically biased Obama officials to prevent his election. (The probe remains ongoing.) In fact, the sources said, the Durham investigation has so far uncovered no evidence of any wrongdoing by Biden or Barack Obama, or that they were even involved with the Russia investigation. There 'was no evidence … not even remotely … indicating Obama or Biden did anything wrong,' as one person put it.[275]

Criticism

On December 11, 2019, former Attorney General Eric Holder, who had served under President Obama, wrote an op-ed in The Washington Post claiming William Barr is "unfit to be attorney general"[276]for his "naked partisan[ship]", "attempts to vilify the president's critics", his attacks on the inspector general and his comments on ongoing investigations.[276]

In a December 2019 opinion piece, former FBI director, CIA director and federal judge William Webster wrote of "a dire threat to the rule of law in the country I love." Webster asserted that "the integrity of the institutions that protect our civil order are, tragically, under assault," writing that "aspersions cast upon [FBI employees] by the president and my longtime friend, Attorney General William P. Barr, are troubling in the extreme."[277] Since 2005, Webster had served as the chair of the Homeland Security Advisory Council.

Actions Barr took in the Roger Stone case led to an outcry from a bipartisan group of more than 2,000 former DOJ employees, who called on Barr to resign.[278]

Sixty-five law professors and faculty from George Washington University Law School, Barr's alma mater, wrote in a June 2020 letter that he had "failed to fulfill his oath of office to 'support and defend the Constitution of the United States.'" They wrote that Barr's actions as attorney general "have undermined the rule of law, breached constitutional norms, and damaged the integrity and traditional independence of his office and of the Department of Justice."[279]

During a June 2020 House Judiciary Committee testimony, Donald Ayer, a former deputy attorney general for whom Barr worked during the George H. W. Bush presidency, asserted that Barr "poses the greatest threat, in my lifetime, to our rule of law and to public trust in it".[280] Three months later, Ayer claimed Barr "is on a mission to install the president as an autocrat."[281]

Political positions

Barr with Senator Mitt Romney in February 2019

A lifelong Republican, Barr takes an expansive view of executive powers and supports "law and order" policies.[282] Considered an establishment Republican at the time of his confirmation, Barr gained a reputation as someone loyal to Trump and his policies during his second tenure as Attorney General.[282] His efforts to support the sitting president politically during his DOJ office tenure have been viewed as the most strenuous since those of another law-and-order Attorney General, John N. Mitchell.[283]

Immigration

As Deputy Attorney General, Barr – together with others at the Department of Justice – successfully led the effort for the withdrawal of a proposed Department of Health and Human Services rule that would have allowed people with HIV/AIDS into the United States.[284] He also advocated the use of Guantanamo Bay to prevent Haitian refugees and HIV infected individuals from claiming asylum in the United States.[61] According to Vox in December 2018, Barr supported an aggressive "law and order" agenda on immigration as Attorney General in the Bush Administration.[285]

Death penalty

Barr supports the death penalty, arguing that it reduces crime. He advocated a Bush-backed bill that would have expanded the types of crime that could be punished by execution. In a 1991 op-ed in The New York Times, Barr argued that death row inmates' ability to challenge their sentences should be limited to avoid cases dragging on for years: "This lack of finality devastates the criminal justice system. It diminishes the deterrent effect of state criminal laws, saps state prosecutorial resources and continually reopens the wounds of victims and survivors."[286][287]

On July 25, 2019, Barr announced that the United States federal government would resume its use of capital punishment under his leadership, after nearly two decades without an execution. Barr ordered the Department of Justice to adopt a new lethal injection protocol, consisting of a single drug (pentobarbital), and ordered execution dates to be set for five inmates in December 2019 and January 2020.[288]

On July 14, 2020, Daniel Lewis Lee became the first death row inmate executed by the federal government since 2003.[289] Since then, six other death row inmates have been executed, two in July 2020, two in August 2020, and another two in September 2020.

Social issues

Abortion

In 1991, Barr said he believed the framers of the Constitution did not originally intend to create a right to abortion, that Roe v. Wade was thus wrongly decided, and that abortion should be a "legitimate issue for state legislators".[33] In contrast, Barr said during his 1991 confirmation hearings that Roe was "the law of the land" and that he did not have "fixed or settled views" on the subject.[34]

Religion

In a 1995 article for The Catholic Lawyer, Barr said the American government is "predicated precisely" on the Judeo-Christian system.[290]:3 Barr grapples with the challenge of representing Catholicism "in an increasingly militant, secular age."[290]:1 Barr asserts that there are three ways secularists use "law as a legal weapon."[290]:8 The first method is through elimination of traditional moral norms through legislation and litigation; Barr cites the elimination of the barriers to divorce and the Supreme Court's decision in Roe v. Wade as examples of this method.[290]:8 The second is the

promotion of moral relativism through the passage of laws that dissolve moral consensus and enforce neutrality.[290]:8 Barr draws attention to a 1987 case, Gay Rights Coalition v. Georgetown University, which "compel[s] Georgetown University to treat homosexual activist groups like any other student group."[290]:9 The third method is the use of law directly against religion; as an example of this method, Barr cites efforts to use the Establishment Clause to exclude religiously motivated citizens from the public square.[290]:9 Concluding, Barr states the need to "restructure education and take advantage of existing tax deductions for charitable institutions to promote Catholic education."[290]:12
In an October 2020 op-ed in The Washington Times, Barr argued in favor of religion in public life, stating that "the imperative of protecting religious freedom ... reflects the Framers' belief that religion was indispensable to sustaining our free system of government."[291]
Drug policy
Barr supports a federal ban on marijuana.[292] However, he has stated that the discrepancy between federal and state law is suboptimal, and that if a uniform federal ban on marijuana could not be achieved, then he would support the STATES Act on marijuana legalization.[292] "I think it's a mistake to back off on marijuana ... However, if we want a federal approach, if we want states to have their own laws, then let's get there and let's get there the right way." Barr also said DOJ policy should align with congressional legislation.[293]
2016 election
Barr donated $55,000 to a political action committee that backed Jeb Bush during the 2016 Republican Party presidential primaries and $2,700 to Donald Trump during the general election campaign.[294]
Executive powers
Barr is a proponent of the unitary executive theory, which holds that the President has broad executive powers.[3][121][295][296][297] Prior to joining the Trump administration, he argued that the president has "complete authority to start or stop a law enforcement proceeding."[3]
Race relations
In June 2020, amid the George Floyd protests against racism and police brutality, Barr said he rejected the view "that the law enforcement system is systemically racist."[298] In a CNN news interview in September 2020, Barr denied that systemic racism plays a role in police shootings of unarmed African American men and called such shootings by white police officers "very rare."[299]
China
In July 2020, Barr condemned large American tech companies, such as Google, Microsoft, Yahoo, and Apple,[300] and Hollywood studios, accusing them of "kowtowing" to the Chinese Communist Party for the sake of profits. He said that "Hollywood now regularly censors its own movies to appease the Chinese Communist Party, the world's most powerful violator of human rights".[301]
2020 election
Disputing President Trump, on 1 December 2020, Barr stated that the Justice Department "has not uncovered evidence of widespread voter fraud that would change the outcome of the 2020 presidential election".[302]
Personal life
Barr has been married to Christine Moynihan Barr since 1973.[13] She holds a master's degree in library science, and together they have three daughters:[303] Mary Barr Daly, Patricia Barr Straughn,[304] and Margaret (Meg) Barr.[11] Their eldest daughter, Mary, born 1977/1978, was a senior Justice Department official who oversaw the department's anti-opioid and addiction efforts; Patricia, born 1981/1982, was counsel for the House Agriculture Committee; and Meg, born 1984/1985, is a former Washington prosecutor and cancer survivor (of recurrent Hodgkin's lymphoma), was counsel for Republican Senator Mike Braun of Indiana.[11]
In February 2019, as their father awaited Senate confirmation for his appointment as Attorney General, Mary left her post at the Department of Justice as the Trump Administration's point woman on the opioid crisis and took a position at the Financial Crimes Enforcement Network (FinCEN), the Treasury Department's financial crimes unit.[305] Her husband, however, continued to work in the Justice Department's National Security Division.[306] Around the same time Mary left the Department of Justice, Tyler McGaughey, the husband of her youngest sister, left the U.S. Attorney's office in Alexandria, Virginia, to join the White House Counsel's office.[305]
Barr is an avid bagpiper. He began playing at age eight and has performed competitively in Scotland with a major American pipe band. At one time, Barr was a member of the City of Washington Pipe Band.[39]
Barr is the brother of Stephen Barr, a physics professor at the University of Delaware.[12]
Barr and Robert Mueller have known each other since the 1980s and are said to be good friends. Mueller attended the weddings of two of Barr's daughters, and their wives attend Bible study together.[307]

1994 LaRouche PAC article : "William Barr, the Bush Clique, and Their Friends at Dope, Inc. "

- https://larouchepub.com/eiw/public/1994/eirv21n42-19941021/eirv21n42-19941021_029-william_barr_the_bush_clique_and.pdf / 1994-10-21-executive-intel-review-v21-n42-william-barr-and-the-bush-clique.pdf / https://drive.google.com/open?id=1AWBKDbuPh2i6NFqJ276OcZMk3lAJ7Y7u

Two members of George Bush's covert action team, former U.S.Attorney General William Barr and Lt.Col.Oliver North, both plunged into Virginia politics this year.Barr was head of the governor's commission to abolish parole, proposing to make prison inmates slaves under private corpo rate control.North was promoted for the U.S.Senate as a "law and order" candidate.

Oliver North became world famous in the 1980s as a smuggling manager in the Iran-Contra drug-running and gun running affairs.

William Barr, though little known to the public, is a top lawyer for the same criminal covert action team.He was also Attorney General in the Bush administration, when Lyndon LaRouche, then a political prisoner, submitted six volumes of new evidence proving that the government always knew he was innocent, evidence which the Justice Department and the courts refused even to look at.We shall report here on Barr's unusual career, protecting the political and financial managers of the world narcotics trade.

[...]

Blocking the BCCI investigation

*Executives of the **Bank of Credit and Commerce International (BCCI)** were indicted in October 1988, on charges they conspired with cocaine traffickers to launder millions of dollars in narcotics profits. Forty U.S. and foreign banks, evidently complicit in the international drug trade, were subpoenaed to produce records before a Tampa, Florida grand jury.A majority of those subpoenaed had earlier been named in EIR's best-selling book, Dope, Inc., as among those lead ing British and allied Wall Street banks in the business of washing dope money.*

BCCI was further exposed as an instrument for the trans actions of Oliver North and his associates, who had been criminally employed by Vice President George Bush in the Iran and Contra operations.

But George Bush was elected U.S.President just weeks after the BCCI indictments.In December 1989, Bush ordered the U.S.bombing and invasion of Panama, killing thousands. Panamanian Gen. Manuel Noriega, who knew the dirtiest drug-pushing secrets of BCCI, Bush, and North, was kidnapped and imprisoned in Florida.

Under the leadership of Attorney General Richard Thornburgh and William Barr, who was then an official in the Bush Justice Department, the BCCI investigations were stopped.Plea bargains protected the world's top drug bank ers, and protected President Bush and his criminal employee North.In exchange for leniency, officials of BCCI agreed to help Bush prosecute General Noriega for alleged drug trafficking.

Barr, who had a startling private relationship to BCCI, and who had drawn up the spurious legal rationale for the attack on Panama, was then appointed U.S.Attorney Gener al.He reached a final settlement of the BCCI case, foreclosing all further investigations of the BCCI-linked drug apparatus.

Initiation into the Bush team

We shall now trace Barr's route to political power, ob serving his early initiation into the Bush covert action machine.

Barr reportedly decided, while still a high school student, that he would one day be the head of the Central Intelligence Agency.He joined the CIA's internship program while he was a Columbia University graduate student in 1971, and went to work full time for the CIA when he left Columbia in 1973.

During his first two years with the Agency, Barr worked for the intelligence directorate in the China department. He would soon cross paths with George Bush, who went to Beijing in 1974 as Secretary of State Henry Kissinger's liaison chief to the Communist Chinese government.

*Barr was already in the CIA's legal office in 1976 when Bush became Director of Central Intelligence. Bush promptly brought back assassinations manager **Theodore***

Barr was already in the CIA's legal office in 1976 when Bush became Director of Central Intelligence. Bush promptly brought back assassinations manager ***Theodore Shackley*** *as associate deputy CIA director for covert operations, along with Shackley's deputy* ***Thomas Clines****. Shackley had been the head of the CIA Miami Station in the early 1960s, following the disastrous invasion of Cuba. Shackley and Clines had assembled the Cuban irregulars, who had been trained as assassins and smugglers, into a permanent covert action force. Men like* ***Felix Rodriguez*** *had served under Shackley as he ran the opium-growing projects in Laos and the Operation Phoenix mass murder project in Vietnam.*

Shackley's Cubans had turned up as the 1972 Watergate burglars, paid by George Bush's Texas political machine. Shackley would later serve as George Bush's speechwriter in Bush's campaign against Ronald Reagan for the 1980 Republican presidential nomination. When Bush got in as vice president instead, Felix Rodriguez and Oliver North together would supervise the Contras' drug running, out of George Bush's vice presidential office.

William Barr joined this team as it matured under George Bush's hand at the CIA. Barr prepared briefs for Bush's stonewalling responses to congressional probes, led by Sen. Frank Church and Rep. Otis that attempted to bring the Bush and Kissinger covert under the rule of American law.

George Bush made one extraordinary change at the Agency which was never publicized beyond the ranks of the intelligence community. Bush committed the United States to share with Great Britain's secret service the fruits of the U.S. satellite surveillance throughout the world. This action dismayed many in the American service who has seen traitors such as ***Kim Philby*** *as the very heart of the British Crown's leadership grouping But Bush's official intelligence policy change reflected his deep-seated ties to Britain, from his father, Prescott Bush's, banking partnership with Averell Harriman in British geopolitical schemes from the 1920s to the 1950s. This Anglo-Bush faction of the intelligence community would soon fashion BCCI into a global rime instrument.*

Jimmy Carter won the 1976 presidential election, and refused Bush's request to stay Jr as CIA director. Barr was one of the many CIA men who left the Agency after Bush's departure in 1977. Ted Shackley led the Association of Former Intelligence Officers and cdrralled these men into a private intelligence clique around George Bush.

On George Bush's recommendation, the 27-year-old Barr was hired in 1977 as clerk to Federal Circuit Court Judge Malcolm Wilkey. During the 1960s, Wilkey had been general counsel to a copper-mining conglomerate operating in Chile under the political management of Prescott Bush's banking partner, Spruile Braden. Salvador Allende became Chile's President and confiscated Braden's huge El Teniente mine; Allende was soon overthrown and murdered in 1973.

In 1976, Chilean opposition leader Orlando Letelier had been blown up by a car bomb in Washington, D.C. Though the U.S. media generally blamed the Chilean secret police for the killing, it is well established that then-CIA director George Bush had penetrated the Chilean agency and had squelched all U.S. police investigation into the murder. Barr's new boss, Malcolm Wilkey, later served as George Bush's ambassador to Uruguay and arranged cool-out payments to Chileans who might have fingered Bush's CIA for the Letelier bombing.

Later, in 1992, Chile's Supreme Court decided that Presi dent Bush could be legally ordered to appear in Chile, to testify on the role of the CIA in the Letelier case; Chilean generals claimed they have been wrongly blamed for the killing, and that Bush's CIA ordered the 1976 bombing. The U.S. chief law enforcement officer, Attorney General William Barr, did not respond. But what he did, was to hire Malcolm Wilkey as a special prosecutor to intimidate the Democratic Congress in the House Post Office affair.

On Judge Wilkey's recommendation, Barr started in Oc tober 1978 as an associate of the Washington, D.C. law firm Shaw, Pittman, Potts, and Trowbridge. Barr immediately took up the representation of B.F. Saul II, a Maryland real estate magnate who only a few months earlier had become chairman of Financial General Bankshares. In his later testimony to the Senate hearings on his confirmation for Justice Department posts, Barr revealed that he had represented B.F. Saul beginning November 1978, and in 1979, 1981, and 1982.

This was an extraordinarily important stretch of time in his client's life. During this period, Financial General was taken over in stages by BCCI, a London-based bank with Arab and other principal investors tied to Anglo-American intelligence. Saul's Financial General Bankshares changed its name to First American Bankshares, and functioned as the Maryland, District of Columbia, and Virginia arm of the British spook-bank BCCI.

What did Barr really know about BCCI?

A decade later, the worldwide scandal would begin with the British taking regulatory action against BCCI in London. British newspapers called BCCI a front for the CIA. The scandal culminated in the prosecution of the elderly Clark Clifford, who at a certain point replaced Saul as chairman of First American.

In America, much of the scandal centered around the "secret" ownership of First American by the BCCI group of investors, in violation of U.S. banking laws requi[ri]ng transparency of bank control. William Barr told the Senate that the government could not have prosecuted BCCI earl[i]er, because it had not discovered this secret BCCI involvement in First American until a [d]eca[d]e after the fact. [B]ut to w[h]om was it secret? Had it really been a secret to Attorney General Barr?

Regardie's magazine of May 1990, quote[d] Cliffor[d] that B.F. Saul "had occasion to go to London, maybe more than once. He had occasion to go to the Middle East, the Persian Gulf countries. I remember later on his talking with me, an[d] he said, 'I have looked into the reputation, particularly o[f] e leader of the group, of His Excellency Sheikh Kamal Adham' [chief of Saudi intelligence]. And he said, 'It's [d]ifficult to recall a time when I have heard such universal commen[d]at[i]on for an international businessman. I hear it in Lon[d]on. [I]'ve heard the most commendatory comments. I've hear[d] a[bo]ut him in the countries of the Persian Gulf. I have not hear[d] one whisper of criticism against this man.' And he said, 'I feel perfectly comfortable about this group, headed by this man, coming in and taking over our banks.' "

Attorney William Bar'r s client du[ri]ng the takeover, B.F. Saul, tried to put a different spin on the matter. He told Regardie's: "I never did go to the Middle East to meet him. I think I met Kamal Adham in Washington once. I don't think I ever met him in London. I met him for 20 minutes. I did not try to make a judgment whether they should own a bank. That was something for the Federal Reserve to do. All I was concerned about was whether this was in the best interest of the shareholders, and I thought it was " (emphasis added).

Barr told the Senate that he had represented B.F. Saul through March 1982. By this time, the BCCI takeover of First American was completed. In April 1982, Clifford re placed B.F. Saul as First American's chairman, although Saul stayed on the board. In May 1982, Barr ceased being a private attorney, and joined the White House legal staff, becoming an intimate collaborator of Vice President George Bush's counsel C. Boyden Gray.

Bush's covert action apparatus

Barr was officially back in government at the precise time that the Bush team was consolidating extraordinary power, and the new BCCI arrangements would be useful for [th]eir global offensive.

On May 14, 1982, Vice President Bush's position as chief of all U.S. covert action was formalized in a secret memorandum (signed "for the President" by Ronald Reagan's National Security Adviser William P. Clark an[d] declassified during the congressional Iran-Contra hearings). The memo explained that "National Security Decision Direc tive 3, Crisis Management, establishes the Special Situation Group (SSG), chaired by the Vice President. The SSG is charged. . .with formulating plans in

anticipation of crises. "

The memo also announced the birth of the Standing Crisis Pre-Planning Group (CPPG),to work as an intelligence-gathering agency for Bush and his SSG. This new subordinate group ,consisting of representatives of Vice President Bush, National Security Council (NSC) staff members, the CIA, the military, and the State Department, was to "meet periodically in the White House Situation Room. " They were to identify areas of potential crisis and "present . . . plans and policy options to the SSG " under Chairman Bush. And they were to provide to Bush and his assistants,"as crises develop, alternative plans," "action/options," and "coordinated implementation plans" to resolve the "crises. "

Finally,the subordinate group was to give to Chairman Bush ami his assistants "recommended security,cover,and media plans that will enhance the likelihood of successful execution. " It was announced that the CPPG would meet for the first time on May 20,1982, and that agencies were to "provide the name of their CPPG representative to Oliver North,NSC staff'; North would henceforth function under Bush's direction in the smuggling of drugs and weapons. Felix Rodriguez,North's cohort in the massive cocaine smuggling of the Contras, began operating through George Bush's office in August 1982, and appeared in Bush's office no later than March 17,1983.

Barr left the administration in September 1983, returning to Shaw,Pittman. Two years later,the illegal shipment of missiles to the Khomeini regime in Iran was planned, officially, at an Aug. 8,1985 meeting of Vice President Bush with the National Security Planning Group in the residence section of the White House.

The work of Bush and his cadres bore fruit in what be came known,years later,as the first transactions of the Iran scandal. The London Financial Times on July 29,1991 described the way BCCI had become a "magnet for covert operations in the 1980s":

- *"BCCI Used by Iran to Buy U.S. Missiles*
- *"London branches of BCCI were used to finance the export of U. S. anti-tank missiles during [Iran's] war with Iraq.*
- *"The export of the TOW missiles together with other weapons in 1985 was arranged by an Indian-born British arms dealer who figured prominently in the Irangate arms-for-hostages scandal and was wound up in February of this year.*
- *"The man at the center of the deal was Mr. Ben Banerjee, a London-based businessman, who boasted of his links with Col. Oliver North,the disgraced former White House official at the center of Irangate. Mr. Banerjee died of a heart attack in May 1990.*
- *"The . . . $ 18. 8 m[illion] deal in 1985 . . . was disguised as a shipment of' I ,250 lift trucks'. . . .*
- *"Mr. Arthur Liman, former chief counsel of the Senate's Iran-Contra committee . . . told the FinanciaL Times that Mr. Adnan Khashoggi,the Saudi arms dealer who was one of the main figures in the scandal, made payments from his ac counts at the BCCIto the Enterprise Fund [of Oliver North] . . .*
- *"The story of how Mr. Ba erjee . . . arranged for the shipment of arms . . . provides a revealing insight into the way in which [BCCI] became a ragnet for covert operations in the 1980s. . . . A U. S. investigator said . . . BCCI could have been involved in the begin ing and the end of the TOW missile transactions.*
- *According to the document ,some of the weapons were shipped through Poland. "*

Barr in power

As a member of the Bush team since 1976, Barr was the first Assistant Attorney GeJeral installed at the Justice Department after Bush's 1988 election to the presidency. He was chief of the Office of Legal Counsel. During one late night session,Barr drafted the brief justifying the kidnapping of Panama's General Noriega; he also supplied legal pretexts for the bombing and invasion of Iraq. Barr further developed the astonishing legal theory,which came to be known as the Thornburgh Doctrine, that the FBI could kidnap people in foreign countries, even against those countries' laws and regardless of U . S. obligations under international law. Some congressmen were reportedly angry with Barr for keeping confidential the text of the brief upon which this legal doctrine was based.

In May 1990, Barr was elevated to Deputy Attorney Gen eral, was in charge of the day-to-day management of the Justice Department. As a Bush insider, Barr gradually took over much of the power of his nominal boss,the discredited Attorney General Thornburgh. In August 1991, Thornburgh resigned; Barr became acting Attorney General and was soon officially nominated for the post.

In his Senate confirmation hearings, Barr was asked by Sen. Strom Thurmond (R- S.C.), "What are your goals during your tenure as Attorney General?"

In reply, Barr first made it clear that an attack on the leadership of the world narcotics trade, or any top-down approach to the drug problem, was strictly ruled out: "Obvi ously, drugs has to continue as a top priority. In my view, it is a long-term struggle. We are talking here about the cold war. We are not talking about Desert Storm. This problem took decades to come about, and it is going to take decades to cure. But part of my responsibility and my priority will be to keep the pressure on, so we continue to make progress."

What progress? The money-laundering bankers, the co vert-action drug smugglers, and the corrupters of the security and military services, are all untouchable by law enforcement, because they are "gentlemen and men of distinction" for Barr [...].

What did Barr have in mind, when he told the senators that he would be "attacking criminal organizations"? It was not the Dope, Inc. apparatus, which criminally employs and feeds the drugs to America's youth. Rather,Barr would tar get the street-level criminals. He was crudely hyping up vic tims of violent crime, speaking of "street gangs, many of which are involved in drug trafficking themselves,and I think there are some initiatives we can take in that area. We are focusing . . . more on those kinds of organizations like the Cripps and the Bloods. You may have read about the FBI anti-gang squad that was established in Washington, and I think you will be seeing more of that nationwide.

"[Then there is] the problem of career criminals, armed career criminals. We have strong firearm statutes . . . and we are seeking some additional statutes and we realize that a very high proportion of violent crime is committed by a very small group, a cohort of hardened criminals, career criminals,and we can use the firearm laws to apprehend these individuals and put them away in federal prison for long periods of time."

How the dope trade was saved

Just before Bush's 1988 election to the presidency, as the Iran-Contra scandals continued to boil,executives of BCCI were indicted for conspiracy to launder millions in cocaine profits.

Recently a former high-level U.S. government official with intimate knowledge of the BCCI case told EIR that the Reagan-Bush-era CIA had initiated the bank's trafficking in drugs and arms. This source said that the CIA had assured BCCI associates that these practices were in accord with U.S. national security. Here was the operation of the Bush "Special Situation" executive, briefly thrown into public view with the BCCI indictments,

The records of at least 40 banks were subpoenaed in connection with BCCI's drug-money laundering, including Bank of America, which helped finance the founding of BCCI's start-up company, and at one point owned 20% of BCCI. Customs agents scrutinized Bank of America accounts used by people linked to Roberto Alagino, a

of BCCI's start-up company, and at one point owned 30% of BCCI. Customs agents scrutinized Bank of America accounts used by people linked to Roberto Alcaino, a Colombian arrested in 1988 in New York on cocaine-smuggling charges. Alcaino was named in BCCI indictments as "a major trafficker" of cocaine to New York, Los Angeles, and Chicago. Executives of BCCI allegedly helped him launder his profits.

Other major banks targeted by the federal probe included:

- ***Marine Midland Bank**, since 1978 owned by the Hong kong and Shanghai Banking Corp., so notorious since the British Opium Wars of the nineteenth century as a drug bank, that the New York State Banking Commission blocked its buyout of Marine Midland;*
- ***Republic National Bank**, the New York City flagship firm of Israeli mafia figure Edmond Safra, whose banking empire stretches from the eastern Mediterranean to Ibero-America;*
- ***Bank of Nova Scotia**, the Canadian banking giant, which was identified in EIR's Dope, Inc. as the institution that opened up the Caribbean as an offshore money-laundering center,in collusion with the **Meyer Lansky** syndicate;*
- *Another Florida bank subpoenaed, **Dadeland Bank**, was owned by a group of anti-Noriega Panamanians.*

But these investigations were sabotaged and shut down. And in December 1991, Attorney General Barr announced that BCCI had entered a guilty plea to certain racketeering charges, in return for which the U.S. Justice Department agreed to drop all other federal and state charges that might be brought against BCCI entities in the future. In the plea bargain arrangement,BCCI forfeited all of its estimated $550 million assets in the United States, and there were some minor jail sentences. But the global drug apparatus, which had for a time been publicly challenged, was safe.

2019-01-11-city-journal-org-if-confirmed-ag-barr-reputation.pdf (https://www.city-journal.org/william-barr-attorney-general-nominee)

What would William Barr do if he is confirmed as attorney general and confronted with a repetition of the 1973 Saturday Night Massacre, when Richard Nixon tried to save his presidency by ordering his attorney general to fire the special prosecutor investigating him? Would he be willing to shut down special counsel Robert Mueller's investigation?

After meeting with him earlier this week, Senator Lindsey Graham said that Barr had assured him that he would let Mueller complete his inquiry into Russia's election-meddling. That view was widely echoed by those who know Barr well. "The man I know would never be swayed by undue political pressure—from editorial boards, the Congress, or a president," said Paul Cappuccio, a former executive vice president and general counsel of Time Warner. "He'll be his own man," said Michael Kelly, who worked with Barr when he came to GTE as general counsel and executive vice president. "Anyone who knows my father knows he's the wrong man to try to bully," said Margaret "Meg" Barr, at 34 the youngest of his three daughters, all lawyers with public-service jobs.

Barr was well regarded during his first stint as attorney general under President George H. W. Bush between 1991 and 1993, but critics argue that his overly expansive view of executive power and defense of Trump in a 19-page unsolicited memo to the Justice Department and to Trump's lawyers raise questions about his fitness for the job. Many insist that Barr should recuse himself from overseeing the Mueller inquiry as a condition of confirmation, though Deputy Attorney General Rod Rosenstein has said that the memo had "no impact" on the Mueller probe.

*In our interviews last month in Washington, Barr refused to discuss either his confirmation hearings, which begin on January 15, or his only meeting with Trump, in December, which one White House official described as a "candid" 90-minute encounter, though Trump reportedly did not ask how Barr would handle the Mueller inquiry. During a wide-ranging interview and at a dinner with his family, Barr did discuss his personal and professional life. **He and Christine, a retired librarian, have been married 45 years. His eldest daughter, Mary, 41, is a senior Justice Department official who now oversees the department's anti-opioid and addiction efforts in Rosenstein's office**; Patricia, 37, is counsel for the House Agriculture Committee; and Meg, a former Washington prosecutor and cancer survivor, is now counsel for Republican Senator Mike Braun of Indiana.*

Barr, 68, clearly wants the attorney general job. "Our institutions matter," he said, without elaboration. He does not seem to fear his confirmation turning into an ugly, partisan brawl that could sully his reputation. Meg's cancer battle took care of that. "If it's not about my daughter's being mortally ill, it's nothing," he said softly in the living room of the new house in McLean, Virginia, that he helped design. "Meg's illness changed our family. It changed me."

*The second of four sons, William Pelham Barr grew up on New York's Upper West Side. **His father became headmaster at Dalton, the elite New York prep school, where his college-educated mother taught English to foreign students.** Barr's values were ingrained early in life—conservative politics and Catholicism—and have never wavered. At Corpus Christi, his Roman Catholic elementary school, he supported Richard Nixon. (A nun took him aside and promised to pray for him.) Even in high school at Horace Mann, the most competitive nonsectarian (but largely Jewish) prep school in New York, Barr stood out. "He wanted to be respected as a conservative intellectual more than liked," recalled Doug Schoen, the Democratic pollster and a fellow student there. "He made it known that he took his intellectual inspiration not from Allard Lowenstein, the Pied Piper of the anti-war movement, but William Buckley." This predilection for early decisions applied to avocations as well. At age eight, Barr took up the bagpipes, and has since played competitively in Scotland and at family events.*

Barr told his high school guidance counselor that he wanted to lead the Central Intelligence Agency, said Robert Kimmitt, a Republican friend of 40 years who has

also held several senior government posts. *While most aspiring analysts studied Russian during the Cold War,* **Barr got a master's degree at Columbia in Chinese—"the other enemy," as he put it**. *Between 1973 and 1977, he worked as a CIA analyst while attending night law school at George Washington.* **As a junior specialist in China, he occasionally was asked to backstop CIA director, George H.W. Bush, a former U.S. ambassador to China, at congressional hearings.** *The connection proved useful.*

Barr's faith and commitment to service have taken priority, his family told me, whether he was working in government or in the private sector as executive vice president and general counsel of Verizon. He has long served on the board of the Archdiocese's Inner-City Scholarship Fund in New York, raising money for Catholic schools and causes. **Friends told me that for many years he has paid the tuition of some 18 students a year at a parochial school in New York, costing him about $50,000 a year.**

Perhaps the pivotal day in the Barr's life was July 17, 2012, when he and Meg learned that her Hodgkin's lymphoma had relapsed. Though 92 percent of Hodgkin's cases are cured, only 17 percent of patients whose cancer returns survive. "It was the worst day of my life," Meg told me. They reacted with resolve, not panic, reading studies, questioning researchers, and examining the results of experimental treatments. "We were like two lawyers preparing a legal brief," she recalled.

They also prayed. Barr asked the nuns at convents he helps support in Illinois and Virginia to pray for his daughter. He also sought help from a rabbi who sent Meg a book of prayers. His own father, though a Catholic convert, was born a Jew. "So I wanted to cover all the bases," he said.

When they chose Dana Farber Cancer Institute for Meg's chemo and stem-cell transplant, Barr suspended work at his law firm, Kirkland & Ellis, and moved with his wife to Boston to be close to her. "He never missed a chemo or radiation treatment, a test or a scan," she said, calling him her "cancer concierge." When Meg needed to be isolated after her stem-cell transplant, Barr rented a house in Scituate, outside Boston, where they walked on the beach and read books together. They talked about a future neither was certain she would have. "Those three months were best and worst of times," she recalled.

Against the odds, Meg recovered. "The hardest part of my illness was accepting the randomness of it, the fact that you can't control the outcome," she said. "Both my father and I tend to be control freaks."

Last December, days after President Trump announced his intention to nominate Barr as attorney general, he walked Meg down the aisle of St. Peter's, their local parish church. He even persuaded the priests to let bagpipes play at the wedding ceremony.

In 1991, after only two days before the Senate Judiciary Committee, Barr's nomination as attorney general was approved unanimously, by voice vote. He won praise for his candor from Judiciary Committee chairman Joe Biden for admitting that he believed the Constitution had not created a right to abortion, and that abortion, though now settled law since Roe v. Wade, should be a "legitimate issue for state legislators."

His second confirmation hearing will surely prove more contentious, especially given Barr's longstanding endorsement of broad presidential powers. **When Barr headed the Justice Department's Office of Legal Counsel in 1989, he deemed legal the invasion of Panama and the arrest of longtime U.S. ally Manuel Noriega and argued that the Bush administration could arrest terrorists and drug traffickers overseas, even in violation of international law. As deputy attorney general in 1990, he advised that President Bush could legally wage war against Iraq, without Congress's approval, though he encouraged Bush to seek a congressional resolution of support to strengthen his political position. Barr is therefore likely to support the issuing of presidential pardons to loyalists. Long a champion of tough-on-crime policies and of tighter immigration controls, he is also likely to embrace former attorney general Jeff Sessions's agenda on both, perhaps even including the legality of separating parents from children at the U.S. southern border.**

But it is the Mueller investigation that will draw the sharpest inquiry. **Barr's memo argues that a president cannot be accused of obstructing justice unless he destroys evidence, urges a witness to lie, or deliberately takes other actions "to block or hinder an investigation." He has criticized Mueller for appointing so many Democratic investigators for his probe. In a 2017 Washington Post op-ed, he argued that Trump "made the right call" by firing James Comey as head of the FBI, and last year he told the New York Times that there was more justification to investigate Hillary Clinton's role in the sale of uranium to Russia than Trump's supposed collusion with Russia.** *Senator Dianne Feinstein has called such views "troubling." Senate Minority Leader Chuck Schumer has vowed to use the confirmation hearings to force Barr to pledge that Mueller's inquiry will proceed unimpeded, and that Congress and the public will see the final Mueller report.*

In his highly qualified, unenthusiastic endorsement of Barr, Benjamin Wittes, editor-in-chief of Lawfare and a senior fellow at the Brookings Institution, called the nominee "as good as we're likely to get," arguing that "all the features that make Barr attractive also make him scary." But Wittes is also encouraged by reports that Barr and Mueller have known and respected one another for years. Senator Graham, one of Trump's most ardent champions, also stressed Barr's respect for Mueller, who was assistant attorney general for the Justice Department's criminal division under Barr.

"Trump may believe that Barr will do his bidding, but that's wrong," said Schoen. "Notwithstanding his memo, what Barr's history tells you is that he won't bend or fold for Trump. His personal and professional record suggest that he will do what he considers legally right and ethical."

In a recent episode of The Lawfare Podcast, former U.S. Attorney Preet Bharara argued that Barr's decisions as attorney general, if he is confirmed, will either burnish or tarnish what is now a sterling reputation. Barr, in sum, has little to gain, but much to lose. That may well be his best qualification for the job.

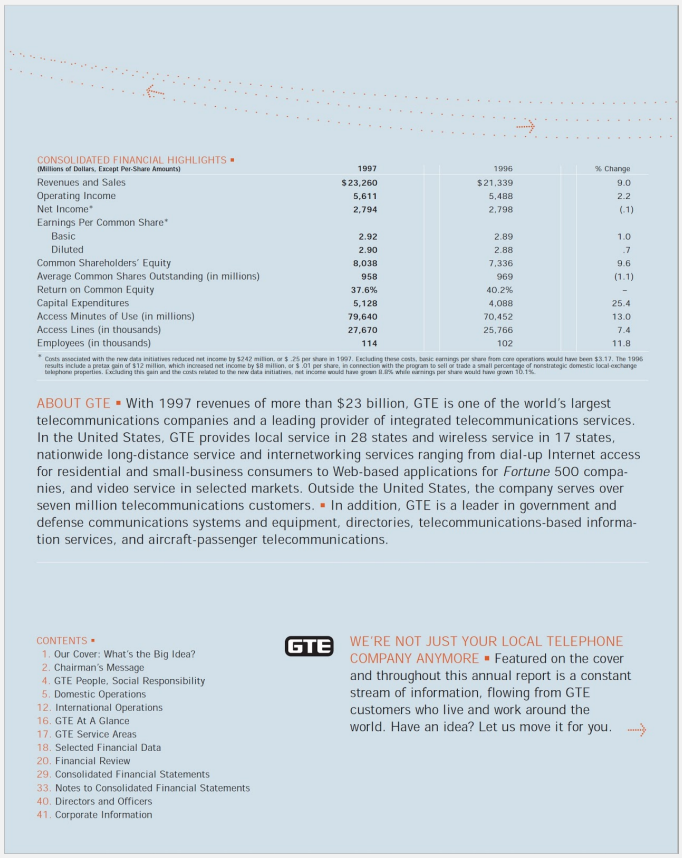
[HC004T][GDrive]



CONSOLIDATED FINANCIAL HIGHLIGHTS ▪

(Millions of Dollars, Except Per-Share Amounts)	1997	1996	% Change
Revenues and Sales	$23,260	$21,339	9.0
Operating Income	5,611	5,488	2.2
Net Income*	2,794	2,798	(.1)
Earnings Per Common Share*			
Basic	2.92	2.89	1.0
Diluted	2.90	2.88	.7
Common Shareholders' Equity	8,038	7,336	9.6
Average Common Shares Outstanding (in millions)	958	969	(1.1)
Return on Common Equity	37.6%	40.2%	–
Capital Expenditures	5,128	4,088	25.4
Access Minutes of Use (in millions)	79,640	70,452	13.0
Access Lines (in thousands)	27,670	25,766	7.4
Employees (in thousands)	114	102	11.8

* Costs associated with the new data initiatives reduced net income by $242 million, or $ .25 per share in 1997. Excluding these costs, basic earnings per share from core operations would have been $3.17. The 1996 results include a pretax gain of $12 million, which increased net income by $8 million, or $ .01 per share, in connection with the program to sell or trade a small percentage of nonstrategic domestic local-exchange telephone properties. Excluding this gain and the costs related to the new data initiatives, net income would have grown 8.8% while earnings per share would have grown 10.1%.

ABOUT GTE ▪ With 1997 revenues of more than $23 billion, GTE is one of the world's largest telecommunications companies and a leading provider of integrated telecommunications services. In the United States, GTE provides local service in 28 states and wireless service in 17 states, nationwide long-distance service and internetworking services ranging from dial-up Internet access for residential and small-business consumers to Web-based applications for *Fortune* 500 companies, and video service in selected markets. Outside the United States, the company serves over seven million telecommunications customers. ▪ In addition, GTE is a leader in government and defense communications systems and equipment, directories, telecommunications-based information services, and aircraft-passenger telecommunications.

GTE

WE'RE NOT JUST YOUR LOCAL TELEPHONE COMPANY ANYMORE ▪ Featured on the cover and throughout this annual report is a constant stream of information, flowing from GTE customers who live and work around the world. Have an idea? Let us move it for you.

[HC004U][GDrive]

PRODUCTIVE ▪ GTE provides over 13,000 Boeing Company employees with dial-up Internet-access service and offers a fast integrated services digital network (ISDN) system to promote telecommuting. We also helped to configure and install a private Central Office telephone switching system. GTE is bidding on customizing a wireless headset system that will allow jet aircraft assemblers to communicate with suppliers – and each other – across the factory floor more efficiently, boosting productivity and quality in its plants in Washington and Kansas.

INTERACTIVE ▪ GTE enables Purdue University in West Lafayette, Indiana, to use a special PictureTel™ system to conduct interactive distance learning, videolinking faculty and students at other campuses to increase office hours and the quality of education. GTE also meets other Purdue communications needs from basic phone service to trial ADSL Internet access and a managed switching facility on the campus, which serves 36,000 students and 12,000 faculty and staff.

GTE seeks to block WorldCom-MCI merger

■ Company says deal would crimp competition

By JEANNINE AVERSA
The Associated Press

WASHINGTON — GTE Corp. is suing in an effort to stop the big WorldCom-MCI merger, contending it would crimp competition and possibly raise prices in the Internet and long-distance businesses.

GTE, which itself made an unsuccessful bid for MCI last November, says the merger would violate antitrust laws. MCI says GTE is just worried about competition.

The lawsuit, filed late Thursday in federal court, raises the same points GTE has made to the Justice Department and other regulatory bodies that are investigating the $37 billion deal.

GTE general counsel William Barr said Friday the lawsuit was "a firewall," filed in case regulators do not stop the merger.

"While we believe that the enforcement agencies are going to do the right thing ... at the end of the day GTE has to be in the position to defend its interests if our concerns are not fully addressed," he said.

Under the merger, MCI-WorldCom would control between 40 percent and 60 percent of Internet traffic flowing on "backbones" in the United States, Barr said. GTE accounts for between 8 percent and 10 percent of such Internet backbone traffic, Barr said.

Internet backbones are high capacity networks that carry Internet and other data traffic.

"The merger will give MCI-WorldCom a stranglehold over the burgeoning Internet and the incentive and ability to stifle competition from all other rival Internet backbone operators, including GTE," the company said in its suit.

WorldCom and MCI reject rivals' allegations that the merger would lead to higher pricing in the Internet and long-distance businesses, MCI spokesman Frank Walter said.

"We think GTE's motive is clearly to keep us from competing more aggressively in the local phone market where GTE has a virtual monopoly," said Walter. "It is disingenuous for them to take the mantle of pro-competition when they preside over one of the largest telephone monopolies in the country."

Walter also said there are 40 major companies, including AT&T, Sprint and IBM, that provide Internet backbone services.

GTE's lawsuit also alleges that the merger will "substantially lessen competition in the highly concentrated wholesale and retail markets for long-distance services."

MCI is the nation's second-largest long-distance company and WorldCom is the fourth largest. WorldCom accounts for 40 percent of long-distance service sold to other companies at wholesale rates, GTE's lawsuit says.

Housatonic

Dr Jordan Jay Baruch (born 1923)

See Thomas Paul Rona (born 1923)

National Academy of Engineering

[HI001Q][GDrive]

Dr. Baruch has made significant contributions to acoustic engineering, the early application of computers to medical and educational practice and management, and teaching technological innovation at Harvard Graduate School of Business Administration and Dartmouth College.

Baruch graduated from James Madison High School, Brooklyn, in 1940, and attended Brooklyn College for the next two-and-one-half years. After three years in the Army during WWII, he enrolled as a junior at Massachusetts Institute of Technology (MIT). Dr. Baruch received his Sc.D. from MIT in 1950 and was on the MIT faculty from 1948 to 1971. From 1970 to 1974, he was a faculty member at the Harvard Graduate School of Business Administration, and from 1974 to 1977, he was professor of business administration at the Tuck School of Business and professor of engineering at the Thayer School of Engineering, both at Dartmouth College.

Baruch was a founding partner and vice president of Bolt Beranek and Newman ([**BBN Technologies, Incorporated**]). Although he left the company from 1966 to 1968 to become department general manager of the MEDINET Department of General Electric, he remained a director of BBN until 1977. He was a also a Founding Member and director of Boston Broadcasters Inc. (Channel 5, Boston) until he joined the Carter administration in 1977 as assistant secretary of commerce for science and technology, a post he held until 1981.

He was elected to membership in NAE in 1974 and became an NAE Fellow and Senior Scholar in 2001. Dr. Baruch is also a fellow of the Acoustical Society of America, IEEE, American Academy of Arts and Sciences, American Association for the Advancement of Science, and New York Academy of Science.

Dr. Baruch holds 12 patents, is the author of numerous articles, has worked in Africa, India, Indonesia, and Jordan, and has been honored by China and Israel for his work in and with those countries. He was a founder of the Trans-Atlantic Institute of the American Jewish Committee and the US/Israel Binational Industrial Research and Development Foundation and a member of the American Boards of Ben Gurion University and the Israel Oceanic and Limnological Research Foundation.

National Academy of Engineering - Dr Jordan Baruch by BY LEO L. BERANEK

Source - [HI001P][GDrive]

JORDAN JAY BARUCH was born August 21, 1923, in New York City and grew up in Brooklyn. Both his father and grandfather were in the wholesale fur business until the collapse of that business in the 1940s. Jordan's father then sought other opportunities, becoming a stockbroker in a small Wall Street firm. Jordan already knew how to read when he entered Midwood Elementary School (PS 99) and graduated eighth grade as an honor student in January 1936. At James Madison High School he participated in the after-school activities of the Microscope club.

One of his projects on hydroponics was selected to be exhibited in the New York World's fair. A talk of his, based on another high school project, "On the Action of Ions on Cardiac Muscles—a Home Made Kymograph," was named "Best of the Session" by the Science Congress of the American Institute.

The kymograph was made up of parts that Jordan bought from junk pushcarts. During these years, Jordan was an enthusiastic Boy Scout, becoming an eagle Scout. Later in life he was a Boy Scout leader. In 1940 he entered Brooklyn College. In his freshman physics class, Jordan's professor announced there would be gender-segregated seating in alphabetical order. Jordan Baruch, the first male, sat next to Rhoda Wasserman, the last female. Jordan invited Rhoda to the BioMed Society Dance. Four years later, in June 1944, when he was a private first class in the U.S. Army, they were married. Their marriage lasted 67 years.

In december 1942, at the age of 19, Jordan enlisted in the U.S. Army, dropping out of Brooklyn College in his junior year. He was offered a place in the Army Specialized Training Program (ASTP) at the Massachusetts Institute of Technology.

He enjoyed MIT until the program came to an end. Fortunately, the participants were assured they would be welcomed back at the end of the war. Jordan did reenter MIT in february 1946, immediately after he was discharged from the army. When the ASTP came to an end, Jordan was assigned to the Army Signal Corps. He served in both the European and Pacific theaters of operation.

When the war ended in Europe, he was sent to Japan. He became very seasick on the long ocean voyage. He wrote home to his young wife Rhoda that, when he returned, he would have nothing in the house that moved — neither a rocking chair nor a porch glider. It is surprising that after his discharge in February

he returned, he would have nothing in the house that moved— neither a rocking chair nor a porch glider. It is surprising that after his discharge in February 1946, he became an avid sailor, first learning in a tech dinghy and later owning a sequence of sailboats, each bigger than the previous.

He taught many of his friends to sail, as well as his children and grandchildren. Favorite vacations involved charters in the Caribbean with friends and "bumping into" old Cambridge friends on some sparsely populated island. Jordan's prize war story was during the Battle of the Bulge. One of the repeater amplifiers along the line failed. He drove at top speed to the nearest army supply depot to obtain a replacement, only to learn that they did not have the part. A Marine supply depot was not far away.

Jordan went there, learned they had the part, but they refused to give it to him without a written request. He threatened and, by hook or by crook, got the part. Communications were quickly restored to general Patton's headquarters to announce the end of the war in Europe. Jordan received a medal. There were other brave exploits, and Jordan ended his service with a box of medals and the rank of technical sergeant.

One of his most memorable and nightmarish experiences in the war was to witness the liberation of the Buchenwald Concentration Camp in 1945. After the war, under the G.I. Bill, Jordan attended MIT as an electrical engineering student, beginning in his junior year. He received his bachelor's and master's degrees in 1948. For his master's thesis he designed a high-speed polariscope for analysis of dynamic stresses, while a co-op student at general radio company.

When he took Professor Leo Beranek's course, "Acoustics 101," in the Electrical Engineering Department, he became very interested in the subject and asked so many questions during class that he had to be told to give the others a chance. With his master's degree, his G.I. Bill money would run out and he was prepared, reluctantly, to leave MIT. Jordan was forever grateful for Beranek's help.

Professor Beranek encouraged him to go for his doctorate and arranged for him to get the Armstrong cork fellowship and other assistance. He received scholarships in the MiT acoustics laboratory during the next two years. Jordan had already taken most of the courses in the electrical engineering department, so he chose to register jointly in three departments: electrical engineering, mechanical engineering, and physics.

He became Beranek's first doctoral student. His thesis work was in the Acoustics laboratory, where he set up a novel means for measuring the sound isolation of building partitions. defense of his thesis exam involved a committee with members from all three departments. one committee member said that Jordan was a stellar candidate and answered questions in all three fields, not responding incorrectly to any. Jordan was appointed an assistant professor of electrical engineering at MIT the next year. During that year he invented what became known as the Baruch-lang loudspeaker, which he patented.

It was a corner loudspeaker, with 4-inch loudspeakers in a vented half-a-cubic-foot box. It received much acclaim, and several thousand were sold. The firm Bolt and Beranek was formed in 1948 and was subsequently renamed Bolt Beranek and Newman([BBN Technologies, Incorporated]). The business grew rapidly, and in the summer of 1951 Jordan became a full-time employee. He seemed to know everything and was quick to offer help to anyone on an eclectic array of subjects, from health and gardening to automobiles and electronics equipment.

He assisted in carrying out a number of consulting jobs. This led to his invention of a structure for reducing noise in ventilating ducts, called SOUNDSTREAM. This patented design was licensed to two manufacturers. In 1952, Jordan and Sam Labate were admitted into the partnership, although the firm's name was not changed. In December 1953, with 39 employees, the company was incorporated.

Bolt was named chairman, Beranek president, Labate vice president, and Baruch treasurer. government contracts started to pour in from the U.S. Army, Navy, National Institutes of Health (NIH), National Science Foundation, and U.S. Department of Defense. [BBN Technologies, Incorporated] grew quickly. The U.S. government decided to make the BBN contracts uniform and set up a contract conference at BBN. Government procurement regulations involved a number of volumes that occupied a 3-foot shelf. Jordan, with his photographic memory, sat down and read the entire set. When the contract negotiators arrived, they found him to be better informed than they were.

At the end of the second day, the government people came out of the meeting obviously overwhelmed by Jordan's proficiency. Soon BBN had more government contracts than any other firm in New England. In 1961 it became apparent that BBN needed cash for expansion. As treasurer, Jordan worked with the auditors to produce a prospectus. An investment banker had to be selected, and Jordan and Beranek interviewed several candidates.

On June 27, [BBN Technologies, Incorporated] made its initial public offering with Hemphill Noyes as the winner, taking BBN public at $12 a share. While at BBN, Jordan was a consultant to NIH. In addition to acoustical consulting for the new clinical center, he designed a colorimeter for monitoring blood during cardiac surgery and developed a novel lighting system used in neurosurgery. He designed other instruments for the medical fields.

His friend at NIH and director of the clinical center, dr. Jack Mazur, persuaded him to work on a computer system for medical records. Jordan took an interest in the new computer field that BBN was pioneering and that was called "time sharing." With time sharing, many operators could use a single computer, sharing data as needed.

Baruch soon envisioned this as a means of bringing computer technology to bear on medical practice. In 1962, contracts were obtained from NIH and the American Hospital Association to install a demonstration computer system for the information processing needs of Massachusetts General Hospital (MGH) in Boston. As Professor Octo Barnett, director of computer science at MGH, has written: "BBN's time- sharing technology was at the cutting edge of computer science, and its use at MGH was one of the first demonstrations of the potential power of remote access to a real, online data base."

With Baruch as parent, the system allowed nurses and doctors to create and access patients' records at a number of hospital stations, all connected to a central station. When Jordan was installed as a regent of the National Library of Medicine, he was introduced as the father of medical informatics. Hospital use of computers looked so promising that in 1966 General Electric set up a new department to merchandise hospital computer systems, called MEDINET. G.E. hired Baruch as department general manager, and he left [BBN Technologies, Incorporated] to go to the new building in Watertown, Massachusetts.

Unfortunately, after a period of time, G.E. mandated that a digital equipment corporation computer could no longer be used (like the one in use at MGH). Instead, Jordan was required to adapt a midrange G.E. Computer System for the project. This was a computer that G.E. had been unable to sell. Jordan and the staff members he had hired tried desperately to modify it in a reasonable length of time but found it impossible. Baruch developed, specifically for MediNeT, a computer programming language called FILECOMP. In 1968, Jordan left General Electric.

From 1968 to 1970, Jordan was president of Educom, a consortium of 100 colleges and universities. Educom's goal was to help institutions adopt networking, computation, and storage in the four principal college and university application areas: administrative systems, teaching and learning, research, and community services. Jordan was particularly interested in a system for sharing library resources, using microfiche technology. The universities were not ready to enter this cooperative venture.

In 1970 he resigned so that he could work full time as an independent consultant. From 1971 to 1974. Baruch was a lecturer in business administration at

the Harvard School of Business administration, where he could develop his ideas about the management of technological innovation. His success there led him to dartmouth college, where he held a joint professorship at the Tuck School of Business and the Thayer School of Engineering from 1974 to 1977. In 1963, Jordan had joined a group of 30 leading citizens from the Boston area who applied for a license to operate a television station on Channel 5 in Boston.

They were successful, and the station went on the air in 1972. It was featured in a two-page article in the New York Times as "probably the best television station in the U.S." In 1982 the station was sold to MetroMedia, and Jordan's share in the receipts made him well off. Afterward, he joined with his longtime friends Isaac Auerbach and William Poorvu, as well as Howard Stevenson from the Harvard Business School, to form an investment firm—The Baupost Group. Under the leadership of Seth Klarman, it has been highly successful. Jordan remained a partner until he died.

While Jordan was at dartmouth, he was invited, along with other experts from around the country, by Under Secretary of commerce Sidney Harman to participate in a seminar in Washington, D.C., to discuss the federal government's role in fostering innovation. As Harman relates in his memoir, Mind Your Own Business (crown Business, 2003), Baruch stood out above the others, and Harman invited him to join the carter administration as assistant secretary of commerce for science and technology. He moved to D.C. in 1977. in his new position, Baruch aimed to foster innovations and competitiveness in the United States.

He led efforts to modernize the Patent and Trademark Office, to transfer and expand the Bureau of Standards into the National Institute for Standards and Technology, and to examine industrial innovation. While at the commerce department, he worked with eminent industry leaders to establish the commerce Technical advisory Board, and they provided President Carter with an "Innovation Study" useful for that and subsequent administrations. Early in the administration, Baruch went on an institute of Electrical and Electronics Engineers (IEEE) mission to china to visit business fairs and factories.

When, shortly after that trip, the United States and China were about to sign an agreement about transfer of science and technology, Baruch voiced his concern that without management reform there would be little advancement in productivity and the standard of living of the chinese people. His concern was based on observations he and his colleagues had made on the IEEE visit. The Chinese were very responsive and followed Baruch's recommendation to establish a school of management jointly with the United States.

Baruch was authorized to help hire staff, including american professors and case writers for the new school in Dalien, China. It was the first example of management education in the People's Republic of China. Professor Bill Dill, first dean of the Faculty at the National Center at Dalien University of Technology, as it came to be called, wrote of how the programs had grown, "built solidly on the conceptual foundation and guidelines for implementation that Jordan provided" (letter to Rhoda Baruch, Nov. 29, 2011).

He recalled that Jordan had negotiated for a computer from control data corporation and for a Xerox copier to be provided for the Dalien Campus, the first such machines for that part of the world. In writing about Baruch's 1979 mission to China, Bruce Merrifield, who followed Jordan in the same position at the Commerce Department, referred to it as a "critical turning point for the country" (letter to Rhoda Baruch, Nov. 18, 2011).

Merrifield wrote that "most of China's leaders are graduates of that school." Another major achievement of Baruch while at the commerce department was the establishment of the Binational research and development foundation (Bird-f) in Israel, which Merrifield stated "may have been of even greater significance" than the Chinese management school. In addition to being a primary engine for the remarkable Israeli economy, Bird-f became the model for similar programs in India, Chile, Finland, Ireland, and Iceland. Much of this was done under Merrifield, but the initial model was Baruch's.

Merrifield wrote: "BIRD-F has now become the primary model which incrementally will be assisting some 80% of the world's 7 billion population, living in underdeveloped countries, to develop their economies as well! What a legacy!" after leaving commerce, Jordan established a consulting firm in Washington, D.C., called Jordan Baruch Associates. The firm has served industry and government in the planning, management, and integration of strategy and technology. Jordan also served on the Board of Regents of the National Library of Medicine.

He was involved in efforts to develop industry strategies and to increase innovation in India, Indonesia, and Israel. Baruch told of a humorous incident: "I was involved in starting another management school in the country Jordan despite the fact that 'Baruch' is a Hebrew word well known in the arab world. At the end of the conference program, crown Prince Hassan asked me, 'dr. Baruch, this has been wonderful. What can we do for you?' I responded, 'I'd like the school named for me.'

There was dead silence. Before anyone's heart could stop I said, 'yes, I would like it called the Jordan Institute.' Crown Prince Hassan just smiled and said, 'done.' and that is what it is called." Baruch was associated with many organizations. In 1956 he was awarded the outstanding young electrical engineer award from eta Kappa Nu. He was a fellow of the acoustical Society of America, the IEEE, the American Academy of Arts and Sciences, the American Association for the Advancement of Science, and the New York Academy of Sciences.

His greatest interest was the National Academy of Engineering (NAE) to which he was elected in 1974 and served on 24 committees after 1982. Of these he chaired the following: General Engineering Peer committee, Subcommittee on Educational Systems, Board on Telecommunications/computer applications, and Panel on Techniques for Affordable Housing. In 2007 he received the NAE's Arthur M. Bueche Award for "the promotion of innovation and managing of science and technology nationally and internationally, thereby enhancing the economy of the U.S. and developing nations." finally, Jordan worked in Africa, India, Indonesia, and Jordan, and he was honored by China and Israel.

He founded the Transatlantic Institute of the American Jewish Committee and was a member of the American Boards of Ben-gurion University and the Israel Oceanographic and Limnological Research Foundation. In 2005 he established at MIT the Jordan J. Baruch fund to support undergraduates conducting research for the Undergraduate research opportunities Program in the School of engineering and the School of Science. Recipients of the fund are known as Baruch Undergraduate researchers.

Jordan held 12 patents and authored many articles. He coauthored the book The Innovation Explosion (free Press, 1997) with James Brian Quinn and Karen A. Zien. He served as president of his synagogue, Adas Israel, in Washington, D.C., and was appreciated as a member of his neighborhood book club in chevy chase, Maryland. He was also a member of the Cosmos Club for many years.

Jordan was a loving husband and partner for 67 years to Rhoda Wasserman Baruch; an active and caring father to Roberta Baruch (Bethesda Maryland), Marjory Baruch (Fayetteville, New York), and Lawrence Baruch (Parsippany, New Jersey). He passed on to his grandchildren a joy for life, a curiosity for understanding, a passion for tinkering, and an appreciation of art, science, and nature, while endowing them with a sense of responsibility for family and the world. His grandchildren (Mina, Solomon, and Sabrina Hsiang; Rebecca, Max, and Julia Ostrov; and Benjamin, Alexander, and Rachel Baruch) treasured their relationship with grandpa.

"Baugh & Sons Company was founded in 1855 and was one of the oldest and largest fertilizer manufacturers in the United States during the late nineteenth to mid-twentieth centuries. Baugh manufactured a variety of ground bone-based agricultural fertilizers that were tailored for a wide range of crops. They later expanded into the manufacture of animal charcoal, glue, and chemicals. Baugh's corporate offices were located in Philadelphia, Pennsylvania. By the early twentieth century Baugh products were widely available from a network of independently owned farm supply stores. In its yearly almanacs they suggested the appropriate brand of Baugh fertilizer for specific crops. Baugh Chemical Company was purchased by Kerr-McGee Oil Industries, Incorporated in 1963. Kerr-McGee ceased to exist as an independent entity in 2006 when purchased by Houston, Texas-based Anadarko Petroleum Corporation. "

Daniel Baugh - See

https://hiddencityphila.org/2016/05/secrets-of-a-house-of-cadavers-reanimated-as-condos/

"

The wealthy Daniel Baugh, a chemical magnate who devoted his time to civic and philanthropic ventures, took notice of the building after the dental school vacated. Baugh was at various points of his life president of Girard Bank, director of the Delaware Insurance Company, director of the Commercial Museum, president of the School of Design for Women (now Moore College of Art), director of the Philadelphia Bourse, director of the Belt Line Railroad Company, president of the Sanitarium Association, president of the Philadelphia Art Club, president of the Philadelphia Art Federation, and president of the Archeology and Paleontology Department at the University of Pennsylvania.

On top of his myriad responsibilities and commitments, Baugh became involved with Jefferson Medical College, with an underlying interest in becoming chairman of the school's board of trustees. Around 1909, Baugh inspected the Jefferson's brand new building at 10th and Walnut and found the Department of Anatomy to be severely inadequate and outdated. He set his sights on providing a new home for the department that would be rivaled by no other medical school.

The former Pennsylvania College of Dental Surgery building was available, close enough to Jefferson's campus, and was already laid out for educational use. In April 1910 Baugh had Jefferson purchase the place for $48,000, taking out a substantial mortgage. One month later Baugh paid off the mortgage with his own money. Five months later he donated another $40,000 for another overhaul, this time designed by architect John Torrey Windrim, which included an addition to the building fitted with the most up-to-date technology and equipment.

Daniel Baugh Institute, 1911 | Source: The Daniel Baugh Institute of Anatomy of The Jefferson Medical College of Philadelphia, Dedication Exercises

Work on the building was complete in September 1911. By the time the new school opened Baugh had other philanthropists donating to the project. He used his own funds to purchase all the furnishings and equipment. His contributions to the school on 11th Street are said to have totaled over $200,000. Naturally, Jefferson Medical College renamed the Department of Anatomy to the Daniel Baugh Institute of Anatomy of the Jefferson College of Philadelphia (certainly an early example of this practice, which dominates the ed-med sector today). A dedication ceremony took place on September 26th, 1911, showcasing the outstanding, 29,350 square foot facility that included a cadaver room in the basement that could hold 350 bodies, a library, a small anatomical museum, multiple laboratories, and two surgical amphitheaters."

'Persian Panthers' enjoying soccer

By Dean Terrill
Southeast Nebraska Bureau

FAIRBURY — If they could afford a name, perhaps nothing would fit better than the Oilers or maybe the Persian Panthers. All but two of the soccering collegians at Southeast Community College-Fairbury are from Iran.

In truth they have no name and no schedule and no official status. They do have the tremendous record of only one loss (and no wins) and a "coach" who'd never seen a soccer game until recently going against a similar foreign group at the University of Nebraska-Lincoln.

"My boys had to tell me who was going to play what positions and when," chuckled Neil Dawes, now serving as SCC foreign student advisor after some 35 years as a county extension agent. "They also told me we lost 2 to 1."

With only a handful of other regional colleges playing the sport, games are hard to come by. The unofficial status also is inhibiting, but high insurance rates have caused the college administration to withhold its full blessing.

Nonetheless, a record foreign enrollment of 43 — including 34 Iranians — makes for "a lot of very voluntary and very rough" soccer on campus. A practice field near the school dormitory often reminds of an Iranian school at recess.

"We're getting enough local interest built up that it appears official recognition might be forthcoming eventually," said Dawes.

Meanwhile, the players are standing their own expenses, even buying their own jerseys and painting numbers on them. By spring they hope to have several games, even if they are "unofficial," arranged.

Joining the Iranian players are Raji Ismail Ansari of Israel and Mike Lawanson of Nigeria. Johansha Bavari, president of the SCC International Club, serves as captain, assisted by Saeed Jamshidinezhad.

Other players are Kamran Behnam, Massoud Askari, Rasol Omidkhoda, Sina Bavari, Mehrdad Salehi, A.R. Yousefi, Mansour Sedaghatzadeh and Rahkhoda Kiani.

A good time to

Fighting anthrax

Related photo Page A11

By ANDREW SYMONDS
News-Post Staff
asymonds@fredericknewspost.com

In cross-county cooperation centered at Fort Detrick, bioterrorism scientists have been working feverishly for the past year towards finding advanced ways to fight anthrax infections.

During a presentation to U.S. Surgeon General Richard Carmona on the base Friday, they said they have made vast steps towards doing just that. The surgeon general was briefed about chemical discoveries in battling anthrax by scientists who have been working on new anti-toxins.

In what Dr. Sina Bavari, of the U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID), called an "extreme collaboration," teams of scientists from around the country have been working together to find more effective ways of combating anthrax since last October's attacks heightened fears about bioterrorism on American soil.

"The attacks got the ball rolling," said Lt. Cmdr. Rick Gussio, a chemist who was one of the presenters Friday and has been working at Fort Detrick on the anti-toxins. "People have been less petty about intellectual property."

Cmdr. Gussio said because of scientists' willingness to share information, the research is two years ahead of schedule.

(See ANTHRAX A-14)

(Continued from A-1)

Dr. Carmona addressed a group of soldiers on the base after the presentation and told them he was impressed with the progress the team has made.

"The research I just heard about normally takes several years," he said. "You guys accomplished this in six months. I couldn't be prouder."

The main partnership has been between the U.S. Public Health Service and the Army, with additional help on the anti-toxins from scientists at Harvard University and the Burnham Institute in La Jolla, Calif.

Dr. Bavari said the headway made towards new anthrax anti-toxins can help researchers battle other aspects of bioterrorism as well.

"If we have the basic structure, when the call comes we will be ready to go," he said.

Chuck Dasey, Fort Detrick public affairs officer, said the base was honored to show the surgeon general the gains they have made towards fighting bioterrorism.

"We're proud that he was very impressed by the scientific presentation he received at USAMRIID, he said.

Drugs protect monkeys from Ebola

WASHINGTON U.S. government researchers working to find ways to treat the highly deadly Ebola virus said on Sunday a new approach from AVI BioPharma Inc saved monkeys after they were infected.

Two experimental treatments protected more than 60 per cent of monkeys infected with Ebola and all the monkeys infected with a related virus called Marburg, the team at the U.S. Army Medical Research Institute of Infectious Diseases in Fort Detrick, Md., reported.

AVI BioPharma already has a contract worth up to $291 million from the U.S. Department of Defense to develop Ebola treatments.

Writing in the journal Nature Medicine, Sina Bavari and colleagues said the drugs tested are antisense phosphorodiamidate morpholino oligomers, or PMOs, called AVI-6002 and AVI-6003.

"Taken together, these studies provide a major advancement in therapeutic development efforts for treatment of filovirus hemorrhagic fever," Bavari's team wrote.

The company has submitted investigational new drug applications for AVI-6002 and AVI-6003 to the U.S. Food and Drug Administration and may now test the drugs in people.

Ebola causes a very serious hemorrhagic fever that has caused dozens of frightening and deadly outbreaks across Africa and threaten endangered gorilla populations as well as people.

It is considered a possible bioterrorism weapon.

2016 (AUg 13) article - Army report says science director creating 'environment of fear' at USAMRIID

Source - Frederick News Post - [HN00O3][GDrive]

A controversial leader is creating a culture of fear and is stifling cutting-edge research at the U.S. Army Medical Research Institute of Infectious Diseases, according to a newly released Army report.

The Army's investigating officer urged that the leader, science director Sina Bavari, be removed from USAMRIID and re-assigned to a job without supervisory duties.

Bavari continues in the position, however, and there is no evidence the institute has acted on these recommendations.

At USAMRIID, Bavari oversees the majority of the Fort Detrick institute's research departments, including staff members who work in immunology, genomics, bacteriology and virology.

The Army found in a 2015 investigation that since Bavari took that position in 2014, he has created an "environment of fear" at the prestigious lab.

"Workers are genuinely afraid for their jobs and scientific careers," the investigating officer stated in the report. In June, *The Frederick News-Post* obtained a copy of the Army report through a Freedom of Information Act request.

The News-Post spoke to multiple sources, including current and former institute researchers, about the Army report. Those who declined to be named feared Bavari would fire them, damage their reputations as researchers, or both.

The Army's investigation of Bavari did not find any illegal activity.

Bavari declined an interview with The News-Post, but issued a statement through a USAMRIID spokeswoman.

In the statement, he said he is honored to serve as science director and looks forward to "enabling USAMRIID's expanded capabilities and increased collaborations."

'Hot potato'

Statements from multiple current and former USAMRIID employees in the Army report showed that Bavari "fostered a negative or toxic leadership climate," the investigating officer stated.

"There is a duality in Dr. Bavari's tactics," a former USAMRIID employee wrote in an email to *The News-Post*. "Those who are loyal and follow him unquestioningly are richly rewarded, while anyone who questions him or whom he otherwise perceives as a threat does not have a long future at USAMRIID, and will usually be made to suffer in the time that they are still there."

The science director tarnished reputations, falsely accused employees of scientific misconduct and threatened them with termination, according to sworn statements in the Army investigation.

Many researchers at the institute work closely with toxins and biological agents such as anthrax and the Ebola virus in maximum-containment laboratories where protective, full-body suits are mandatory.

Henry Heine, who worked at USAMRIID from 1998 until 2010, said in an interview that Bavari was already working at the institute when Heine started there.

According to Caree Vander Linden, a spokeswoman for the institute, Bavari started at USAMRIID as a post-doctoral fellow in 1991.

Heine described Bavari as a "hot potato" who caused problems and was passed from one department to another before he became science director.

In a sworn statement provided for the Army investigation, a colonel said Bavari preferred to hire contractors, so he could terminate them for any reason.

Heine said Bavari took advantage of his ability to terminate contractors.

"When somebody would get into something that crossed him, or crossed something he was trying to do, they would disappear," Heine said.

Heine is currently program director at the University of Florida's Institute for Therapeutic Innovation. He did not work directly with Bavari while at USAMRIID, but felt familiar with the director's modus operandi.

He said Bavari used other employees to further his own goals.

"He's a consummate user," Heine said.

Transformational leader

Current and former USAMRIID employees have described Bavari as condescending, manipulative and disrespectful.

Some also described him as an ambitious, resourceful leader who has attracted diligent, loyal workers to his research team.

Travis Warren, a principal investigator at USAMRIID, noted that the Army investigator did not ask some of Bavari's closest colleagues to provide statements for the Army investigation.

Warren said he has been one of Bavari's right-hand workers since 2007.

"I regard him as the single most influential mentor in my career development," he wrote in an email to *The News-Post*.

Bavari has high expectations and little tolerance for maintaining the status quo, Warren wrote.

"While he often voices strong opinions, I have never felt these viewpoints were presented in an antagonistic or authoritarian manner and have found him to be highly receptive and encouraging of countering viewpoints," he wrote in an email.

Gustavo Palacios, director of the institute's Center for Genome Sciences, also works closely with the science director.

The center houses cutting-edge equipment for genome sequencing, which help researchers gain insight into the genes of bacteria, viruses and potential biowarfare agents. According to Warren, Bavari led efforts to get the Center for Genome Sciences off the ground.

Bavari has a sense of purpose that is "inspirational," Palacios said, and he challenges his staff to think outside the box.

Bavari said in a statement to the investigator that taking care of employees "is of paramount importance to me and is at the centerpiece of my management style."

Palacios described Bavari as a "transformational" leader whose goal is to ensure that USAMRIID is constantly growing and operating as a first-class lab.

"That's a very tall task, given the restrictions in funding and the continuous appearances of new natural challenges like Ebola and Zika, or the potential risks associated with bioterrorism acts," Palacios wrote in an email to *The News-Post*.

Bavari received an honorary doctorate degree from the University of Nebraska this year for leading the institute's efforts to fight the Ebola outbreak.

"Honorary degrees are awarded by the University of Nebraska to recognize those who have attained achievements of extraordinary and lasting distinction," according to a press release from the school.

Palacios said institutions such as the World Health Organization and the Centers for Disease Control and Prevention also praised USAMRIID for its efforts during the Ebola outbreak.

"It means that the institute is moving in the right direction," he wrote in an email to *The News-Post*. "Obviously that is not the sole result of Dr. Bavari's work, but he has taken a leadership role at a crucial time."

A culture without checks

The Army started an investigation into Bavari last year, after a group of anonymous USAMRIID scientists submitted a letter to Army officials who oversee the institute.

Bavari, "while directing his own highly productive research program, is a detriment to the current and future state of medical research at USAMRIID and should be removed from this position," the letter stated. "He is a person lacking in honesty, integrity and character, who in his short time as director has created a climate of distrust, intimidation, and fear of retribution."

The letter writers called Bavari a "catastrophic threat" to the future of USAMRIID.

Some USAMRIID researchers commented to *The News-Post* that the frequent changes in command, in addition to the fact that their recently assigned commanders aren't familiar with infectious disease research, have created a culture without checks or balances.

Fort Detrick installation commander Maj. Gen. Brian Lein and Army Surgeon General Lt. Gen. Patricia Horoho, who received the letter from the anonymous USAMRIID scientists, have since left their positions.

Army spokespeople who took media inquiries for Lein were unable to reach him for comment the week before he ended his two-year assignment at Fort Detrick. Lein's last day as commander of the installation was July 28.

The Department of the Army generally assigns the U.S. Army Medical Research and Materiel Command, or USAMRMC, and Fort Detrick a new commander every two or three years.

Fort Detrick's installation commander traditionally has a dual role as commander of USAMRMC, which manages USAMRIID.

USAMRIID has its own commander, Col. Thomas Bundt, who is also serving a two- to three-year assignment.

Bundt's spokespeople did not respond to a request for comment about the Army investigation.

Conflict of interest

In the investigation, current and former USAMRIID researchers told the Army's investigating officer that Bavari maintains a large research program that seems to be funded "at the expense of other projects," according to the report.

Warren said Bavari has had a positive effect on USAMRIID's research portfolio.

"I have personally observed multiple research programs move from an early discovery phase program to advanced development status due in large part to Dr. Bavari's dedication to USAMRIID's mission," Warren wrote in an email.

But the fact that Bavari has a research program at all creates a conflict of interest, the anonymous USAMRIID researchers wrote in their letter.

"It is impossible for the Science Director to have [his or her] own research program and maintain independent judgment in an ethically responsible way," the researchers wrote.

Hood College biology professor Ann Boyd teaches ethics and sits on the Institutional Review Board for the USAMRMC. The board reviews study proposals from USAMRIID and USAMRMC researchers to ensure that human subjects are treated ethically in experiments.

Directors who conduct research are not necessarily wrong to do so, Boyd said, but those who act in their own self-interest may display a lack of leadership.

"The problem with [a conflict of interest] in research is that it erodes trust," she said.

Connie Dudley, director of graduate programs in science at Mount St. Mary's University, said Bavari's position as director and researcher leaves an "open door" for conflicts.

"It would certainly be a reasonable conclusion that a conflict of interest exists, if indeed this person had the ability to make programmatic changes that would benefit them," she said.

Bavari told the investigating officer that he does not believe having his own research program creates a conflict of interest.

"In order to be an effective Science Director and to have the respect of other scientists, I feel the need to maintain a good scientific reputation in the field," he said.

As a researcher, he said he can better relate to the challenges his staff faces.

Heine said that as a director, it can be difficult to be engaged with scientists if you don't have some of your own research to refer to, but that is a difficult line to walk.

"In an environment where you have a very limited and restricted amount of funding, the temptation is to take care of yourself first, and that's exactly what I think happened," he said.

But, Warren said Bavari has intentionally reduced his role in programs to allow colleagues to step up.

"He intentionally empowers individuals like myself to assume greater responsibilities, while remaining available to advise or assist with challenges that may arise," he wrote in an email.

Questions of support

The Army investigator determined that Bavari uses his power and authority to limit researchers from submitting grant proposals and getting funding from the Defense Threat Reduction Agency, a Department of Defense agency that is a major USAMRIID funder.

The agency declined to comment.

“It would be inappropriate for the Defense Threat Reduction Agency to comment on an USAMRIID matter or employee,” agency spokesman Ron Lovas wrote in an email.

Bavari opted to submit a limited number of proposals to the agency, which were subject to his approval, instead of allowing researchers to submit their own proposals.

That may have kept researchers from securing funding to support their own staff and goals, according to the Army report.

In Bavari’s response to the Army investigation, he argued that his approach eliminated a process that created internal competition and replaced it with team collaboration.

“To ensure that the collective wisdom of USAMRIID’s outstanding scientists are fully applied to solutions for the Warfighter, I am slowly changing the way in which we work with [the Defense Threat Reduction Agency],” he said.

Some USAMRIID employees who provided sworn statements for the Army investigation also were concerned about Bavari’s relationship with the nonprofit Geneva Foundation.

The foundation supports innovative medical research and works with military researchers as they create proposals for federal or other funding.

A dozen principal investigators at USAMRIID are supported by the Geneva Foundation. The foundation also employs 30 research team members at the institute.

The Army investigator asserted that the science director used his relationship with the Geneva Foundation to “bank” funding from pharmaceutical companies to achieve his own research goals without letting USAMRIID know about the funds.

That’s not how the Geneva Foundation works, President Elise Huszar said.

The foundation does not award funding; it works with researchers during the proposal stage and after funding has been awarded from another source, such as the federal government.

“We’re not a grant-making body; we don’t have a cache of money that we make discriminately to different people,” Huszar said.threat

Huszar said the foundation typically works closely with USAMRIID’s business office to make sure financial awards are reported according to Geneva’s requirements.

“There shouldn’t be any awards that USAMRIID doesn’t know about,” she said.

Huszar found multiple problems with the Army’s report.

“Geneva’s experience with Dr. Bavari did not equate with the report that was provided,” she said.

The Army’s findings will not affect Bavari’s relationship with the Geneva Foundation, Huszar said, unless USAMRIID decides to restrict his proposals.

Recommendations

The Army investigator recommended removing Bavari from USAMRIID and re-assigning him to a job without supervisory duties.

The investigator also recommended the following:

Changing the science director position to minimize the possibility of a conflict of interest between that person and the institute’s research

Auditing funding from nongovernmental sources

Requiring detailed reporting of that funding

Extending commanders’ assignments from two to three years to reduce the impact of turnover

Requiring commanders to have subject matter expertise in the research their organizations conduct.

Vander Linden confirmed that Bavari continues to hold the position of science director at the institute, but could not comment whether the institute had acted on the investigator’s recommendations.

Current employees who spoke to *The News-Post* said they have not seen any indications that the institute has done so.

Officially, the institute itself was unable to comment on the report.

“Laws such as the Privacy Act severely restrict what can be discussed related to these matters,” Vander Linden wrote in an email. “Therefore, we are unable to comment further.”

REVIEW

Broad-spectrum coronavirus antiviral drug discovery

Allison L. Totura and Sina Bavari

Division of Molecular and Translational Sciences, United States Army Medical Research Institute of Infectious Diseases, Fort Detrick, MD, USA

ABSTRACT

Introduction: The highly pathogenic coronaviruses severe acute respiratory syndrome coronavirus (SARS-CoV) and Middle East respiratory syndrome coronavirus (MERS-CoV) are lethal zoonotic viruses that have emerged into human populations these past 15 years. These coronaviruses are associated with novel respiratory syndromes that spread from person-to-person via close contact, resulting in high morbidity and mortality caused by the progression to Acute Respiratory Distress Syndrome (ARDS).
Areas covered: The risks of re-emergence of SARS-CoV from bat reservoir hosts, the persistence of MERS-CoV circulation, and the potential for future emergence of novel coronaviruses indicate antiviral drug discovery will require activity against multiple coronaviruses. In this review, approaches that antagonize viral nonstructural proteins, neutralize structural proteins, or modulate essential host elements of viral infection with varying levels of efficacy in models of highly pathogenic coronavirus disease are discussed.
Expert opinion: Treatment of SARS and MERS in outbreak settings has focused on therapeutics with general antiviral activity and good safety profiles rather than efficacy data provided by cellular, rodent, or nonhuman primate models of highly pathogenic coronavirus infection. Based on lessons learned from SARS and MERS outbreaks, lack of drugs capable of pan-coronavirus antiviral activity increases the vulnerability of public health systems to a highly pathogenic coronavirus pandemic.

ARTICLE HISTORY

KEYWORDS
Antiviral; ARDS; acute respiratory distress syndrome; bat; broad-spectrum; camel; civet; coronavirus; emerging virus; highly pathogenic virus; human cases; interferon; in vitro model; lopinavir; MERS; MERS-CoV; Middle East respiratory syndrome; pneumonia; primate model; respiratory; ribavirin; rodent model; SARS; SARS-CoV; severe acute respiratory syndrome; therapeutic; zoonosis; zoonotic

1. Introduction

Outbreaks of severe acute respiratory syndrome (SARS, 2002–2004 [1,2]) and Middle East respiratory syndrome (MERS, 2012-current [3]) in the last two decades are a significant threat to global public health. SARS and MERS represent a new class of public health concern that may continue to emerge into human populations: respiratory syndromes caused by coronaviruses (CoVs) that are transmitted from person-to-person via close contact, resulting in high morbidity and mortality in infected individuals. Although SARS and MERS initially present as mild, influenza-like illnesses with fever, dyspnea, and cough, progression to more severe symptoms is characterized by an atypical interstitial pneumonia and diffuse alveolar damage. Both SARS-CoV and MERS-CoV are capable of causing acute respiratory distress syndrome (ARDS), the most severe form of acute lung injury where alveolar inflammation, pneumonia, and hypoxic lung conditions lead to respiratory failure, multiple organ disease, and death in 50% of ARDS patients [4]. The total confirmed number of patients infected with highly pathogenic CoVs is relatively low (approximately 10,000 cases of both SARS and MERS since 2002), but CoVs are of particular concern due to high case fatality rates, lack of proven therapeutics, as well as the demonstrated ability of these pathogens to seed outbreaks that rapidly cross geographic and geopolitical borders into other countries and continents [5,6].

1.1. Coronaviridae phylogeny and emergence

Highly pathogenic coronaviruses SARS-CoV and MERS-CoV recently emerged into human populations, but other human coronaviruses (HCoVs) including HCoV-OC43, HCoV-229E, HCoV-NL63, and HCoV-HKU1 are estimated to have circulated in human populations for hundreds of years, causing mild respiratory illness to which approximately 5–30% of 'common colds' are attributed [7,8]. Within the *Coronaviridae* family (order Nidovirales) four genera are recognized: alphacoronavirus, betacoronavirus, gammacoronavirus, and deltacoronavirus. The six HCoVs (Table 1) currently identified belong to the genera alphacoronavirus (HCoV-229E and HCoV-NL63) and betacoronavirus (SARS-CoV, MERS-CoV, HCoV-OC43, and HCoV-HKU1). Gammacoronaviruses and deltacoronaviruses have no known viruses that infect humans, but contain important agricultural pathogens of livestock. Epizootic coronaviruses in animals cause a wide range of disease signs resulting from respiratory, enteric, and neurological tissue tropism. Although HCoVs cause primarily respiratory symptoms, the potential for a wide range of severe disease symptoms in humans caused by infection by future emergent coronaviruses cannot be excluded. Despite the severity and diversity of coronavirus disease signs and symptoms affecting a large number of important livestock species as well as humans, there are no proven therapies that specifically target CoVs.

Ran drug discovery projects for the Pharmaceutical Industry. Targets included GPCRs (neuroscience and inflammation), ion channels and transporters (inflammation, metabolic diseases, and neuroscience), kinases and receptors, cell signaling pathways, cellular enzymes (oncology). During 9 years I developed 52 fully characterized cell-based assays. Assays technologies included FLIPR-based, EFC DiscoverX , HTRF CisBio, MDS Transfluor, immuno-staining HCS technologies. I developed multiple assays for SAR, profiling and hit selection; 10 functional follow up HCS assays for PE Opera and Cellomics Array Scan VTI and additionally performed several low scale profiling and secondary screens.

Worked with HTS scientists on development and custom design of HSDM Thermo/duel FLIPR(tetra) Automated system (Reflected by publication in JALA, 2006). Evaluated and integrated (working with our HTS group, Thermo and PE) new technologies: first FLIPR-3-based assays, new fully automated platforms for FLIPR Tetra , PE Opera for first HCS project at Screening Sciences. Evaluated and integrated image-based technologies (PE/Evotec Opera confocal system, Cellomics Array ScanVTI, FCS Guava EasyCyte and Essen IncuCyte.**see less**

BBN Technologies (originally **Bolt Beranek and Newman Inc.**) is an American research and development company,[1] based next to Fresh Pond in Cambridge, Massachusetts, United States.

In 1966 the Franklin Institute awarded the firm the Frank P. Brown Medal, in 1999 BBN received the IEEE Corporate Innovation Recognition, and on February 1, 2013, BBN was awarded the National Medal of Technology and Innovation, the highest honors that the U.S. government bestows upon scientists, engineers and inventors, by President Barack Obama.[2] It became a wholly owned subsidiary of Raytheon in 2009.

History

BBN has its roots in an initial partnership formed on October 15, 1948 between Leo Beranek and Richard Bolt, professors at the Massachusetts Institute of Technology.[3][4] Bolt had won a commission to be an acoustic consultant for the new United Nations permanent headquarters to be built in New York City. Realizing the magnitude of the project at hand, Bolt had pulled in his MIT colleague Beranek for help and the partnership between the two was born. The firm, Bolt and Beranek, started out in two rented rooms on the MIT campus. Robert Newman would join the firm soon after in 1950, and the firm became Bolt Beranek Newman.[5] Beranek remained the company's president and chief executive officer until 1967, and Bolt was chairman until 1976.

From 1957 to 1962, J. C. R. Licklider served as vice president of engineering psychology for BBN.[6] Foreseeing the potential to obtain federal grants for basic computer research, Licklider convinced the BBN leadership to purchase a then state-of-the-art Royal McBee LGP-30 digital computer in 1958 for $25,000. Within a year, Ken Olsen, president of the newly formed Digital Equipment Corporation (DEC), approached BBN to test the prototype of DEC's first computer, the PDP-1.[7] Within one month, BBN completed its tests and recommendations of the PDP-1. BBN ultimately purchased the first PDP-1 for around $150,000 and received the machine in November 1960.[8][9]

After the PDP-1 arrived, BBN hired two of Licklider's friends from MIT, John McCarthy and Marvin Minsky, as consultants.[10] McCarthy had been unsuccessful in convincing MIT engineers to build time-sharing systems for computers. He had more success at BBN though, working with Ed Fredkin and Sheldon Boilen in implementing one of the first timesharing systems, the BBN Time-Sharing System.[11] In 1962, BBN would install one such time-shared information system at Massachusetts General Hospital where doctors and nurses could create and access patients' information at various nurses' stations connected to a central computer.[5] BBN would soon begin more research about integrating computers and medicine, hiring Richard Bolt in 1965 and MIT Lincoln Laboratory computer systems engineer Frank Heart in 1966.[12]

As BBN began focusing on computer technology, it gained a reputation as "the third university" in Cambridge alongside Harvard and MIT, and its offices

As BBN began focusing on computer technology, it gained a reputation as "the third university" in Cambridge alongside Harvard and MIT, and its offices expanded on a site near Fresh Pond in western Cambridge.[13] By 1968, the company had over 600 employees.[14] By the early 1970s, BBN bought a laundromat on Moulton Street and tore it down for a new, seven-story headquarters.[15]

In 1980, the U.S. federal government charged BBN with contracts fraud, alleging that from 1972 to 1978, BBN altered time sheets to hide overcharging the government. That year, two top financial officers plea bargained for suspended sentences and $20,000 fines, and the company paid a $700,000 fine.[16]

BBN's September 1994 celebration of the 25th anniversary of ARPANET generated much local and national news coverage from outlets including *The Boston Globe*, *Newsweek*, and National Public Radio.[17] By that year, Heart retired from BBN after 28 years; his final position was president of the systems and technology division.[18]

Notable achievements

BBN is best known for its DARPA-sponsored research. It has made notable advances in a wide variety of fields, including acoustics, computer technologies, quantum information, and synthetic biology. In recent years, BBN has led a wide range of research and development projects, including the standardization effort for the security extension to the Border Gateway Protocol (BGPsec), mobile ad hoc networks, advanced speech recognition, the military's Boomerang mobile shooter detection system, cognitive radio spectrum use via the DARPA XG program. In the early 2000s, BBN created the world's first quantum key distribution network, the DARPA Quantum Network, which operated for 3 years across Cambridge and Boston, and which included the world's first fully operational prototype of a superconducting nanowire single-photon detector. BBN also led the Global Environment for Network Innovations (GENI) project for the National Science Foundation, which ultimately built out programmable "future Internet" infrastructure across approximately 60 university campuses.[19]

Interface Message Processor

In August 1968, BBN was selected by ARPA to build an Interface Message Processor (IMP) for the ARPANET, the precursor to the modern Internet.[20][nb 1] The IMPs were the very first generation of gateways, known today as routers. Under the leadership of Frank Heart and Bob Kahn, four IMPs were produced for nearly $1 million from September to December 1969.[21][22] The first IMP was shipped to the University of California, Los Angeles in September 1969 and the second to the Stanford Research Institute a month later.[23] The first message between the two IMPs was "LO" — phonetically, "ello" — but the SRI host crashed before the UCLA researcher could complete typing the "LOGIN" command.[5][24]

Acoustics

Well-known acoustics commissions include MIT's Kresge Auditorium (1954), Tanglewood's Koussevitzky Music Shed (1959), Lincoln Center's Avery Fisher Hall (1962), the Cultural Center of the Philippines (1969), Baltimore's Joseph Meyerhoff Symphony Hall (1978)*[citation needed]* and Louise M. Davies Symphony Hall (1979).

The architectural acoustics division of BBN faced controversy in the early 1960s with its acoustics design project for the Philharmonic Hall (now David Geffen Hall) at the Lincoln Center in New York City. Beranek and BBN's chief architect were criticized for ignoring important acoustical principles in concert hall design. Many failed minor adjustments led the walls, balconies, and ceilings to be torn out and dumped, and a new consultant oversaw a repair that cost millions of dollars over several years.[13] The division also produced poor results at the Louise M. Davies Symphony Hall in San Francisco. The hall's large volume and seating capacity initially resulted in less than ideal results. Kirkegaard Associates completed acoustical renovations in 1992 at a cost of $10 million which resulted in substantial improvement. [25]

In the 1960s and 1970s, experts at the company examined audio tapes related to notable events in U.S. history, including the John F. Kennedy assassination Dictabelt recording,[26] an audio recording from the 1970 Kent State shootings, and during the 1974 Watergate scandal, the tape of President Richard Nixon that had 18.5 minutes erased.[27]

The substantial calculations required for acoustics work led to an interest, and later business opportunities, in computing. BBN was a pioneer in developing computer models of roadway and aircraft noise, and in designing noise barriers near highways.[28] Some of this technology was used in landmark legal cases where BBN scientists were expert witnesses.[29]

In early 2004, BBN applied its acoustics expertise to design, develop, and deliver the Boomerang shooter detection system in a little over two months to combat the sniper threat US troops faced in Operation Iraqi Freedom. The system immediately pinpoints the location of hostile fire. Since then, more than 11,000 Boomerang systems have been deployed by US and allied forces.

Computer technologies

BBN bought a number of computers in the late 1950s and early 1960s, notably the first production PDP-1 from Digital Equipment Corporation, on which it implemented the BBN Time-Sharing System(1962).[30]

Ray Tomlinson of BBN is widely credited as having invented the first person-to-person network email in 1971[31] and the use of the @ sign in an email address.[32][33][34]

BBN has had a very distinguished career in natural-language understanding,[35][36] ranging from speech recognition through machine translation and more recently machine understanding of the causality of events and accurate forecasts for the Intelligence Advanced Research Projects Activity (IARPA).[37]

BBN's education group, led by Wally Feurzeig, created the Logo programming language, conceived by BBN consultant Seymour Papert as a programming language that school-age children could learn.[38]Other well-known BBN computer-related innovations include Interlisp programming language, the TENEX operating system, and the Colossal Cave Adventure game. BBN also is well known for its parallel computing systems, including the Pluribus, and the BBN Butterfly computers, which have been used for such tasks as warfare simulation for the U.S. Navy.[39] BBN also developed the RS/1, RS/Explore, RS/Discover and the Cornerstone statistical software systems, and played a pioneering role in the development of today's semantic web, including participating in the DARPA Agent Markup Language project and chairing Web Ontology Language standardization.

Networking technologies

The Internet, circa 1985. BBN built and operated the MILNET, ARPANET, SATNET, and Wideband networks

BBN was involved in building some of the earliest Internet networks, including the implementation and operation of the ARPANET and its Interface

Message Processors;[40][nb 1], as well as SATNET, PRNET, MILNET, SIMNET, the Terrestrial Wideband Network, the Defense Simulation Internet, CSNET, and NEARNET. In the course of these activities, BBN researchers invented the first link-state routing protocol.

BBN was a key participant in the creation of the Internet. It was the first organization to receive an Autonomous System Number (AS1) for network identification.[42]ASNs are an essential identification element used for Internet Backbone Routing; lower numbers generally indicate a longer established presence on the Internet. AS1 is now operated by Level 3 Communications following their acquisition of BBN's Genuity internet service provider. BBN registered the *bbn.com* domain on April 24, 1985, making it the second oldest domain name on the internet.[43][44] In addition, BBN researchers participated in the development of TCP, created the Voice Funnel, an early predecessor of voice over IP, helped lead the creation of the first email security standard, Privacy Enhanced Mail (PEM), chaired development of the "core" Internet Protocol security suite (IPsec) standards, and performed extensive work to secure the Border Gateway Protocol (BGP).

BBN also created a series of mobile ad hoc networks starting in the 1970s with DARPA's experimental PRNET and SURAN systems. Later BBN efforts included the networking portions of the Near-term digital radio (NTDR) and High-capacity data radio (HCDR), the Wideband Networking Software in the Joint Tactical Radio Systemand the Wireless Network after Next (WNaN). It also created the networking portions of the US Army's Mobile Subscriber Equipment (MSE) and Canada's Iris Digital Communications System.

PRNET

First mobile ad hoc network, sponsored by ARPA.

SURAN

Follow-on to PRNET experiments, also sponsored by ARPA.

Mobile Subscriber Equipment (MSE)

Tactical Internet for the US Army

Iris Digital Communications System

Tactical voice + data Internet for the Canadian Army

Near-term digital radio (NTDR)

First fielded mobile ad-hoc network

High-capacity data radio (HCDR)

NTDR version for the British Army

Joint Tactical Radio System (JTRS)

Wideband Networking Waveform

Wireless Network after Next (WNaN)

Experimental tactical ad-hoc network, sponsored by DARPA

SATNET

Early data satellite network linking ARPANET nodes, incorporated into first Internet demonstrations.

ACTS Gigabit Satellite Network

Experimental network supporting a wide range of high-bandwidth networking experiments from 1993-2004.

Celestri

Network architecture for (never launched) Internet constellation, follow-on to the Iridium satellite constellation.

Connexion by Boeing

Networking architecture studies.

Discoverer II

Networking studies for (never launched) LEO constellation of radar satellites

SBIRS Low

Network architecture for (never launched) Space-Based Infrared System LEO constellation.

TSAT

Network architecture for the IPv6 Transformational Satellite Communications System constellation.

Notable BBNers

A number of well-known computer luminaries have worked at BBN, including Daniel Bobrow, Ron Brachman, John Seely Brown, Edmund Clarke, Allan Collins, William Crowther, John Curran, Chip Elliott, Wally Feurzeig, Ed Fredkin, Bob Kahn, Steve Kent,[45] J. C. R. Licklider, John Makhoul, John McCarthy, Marvin Minsky, Dan Murphy, Severo Ornstein, Seymour Papert, Craig Partridge, Radia Perlman, Oliver Selfridge, Cynthia Solomon, Bob Thomas, Ray Tomlinson, and Peiter "Mudge" Zatko. Former board members include Jim Breyer, Anita K. Jones and Gilman Louie.

Spin-offs and mergers

- In 1971, BBN's TELCOMP subsidiary was sold.

- In the 1970s, BBN created Telenet, Inc., to run the first public packet-switched network.
- In 1983 BBN Instruments was sold to Vibro-Meter Corp.
- In 1989, BBN's acoustical consulting business was spun off into a new corporation, Acentech Incorporated, located across the street from BBN headquarters in Cambridge.[47]
- In 1994 LightStream Corp., a joint venture with Ungermann-Bass, Inc. created in 1992 to manufacture asynchronous transfer mode (ATM) switches, was sold to Cisco Systems Inc. $120 million.
- **BBN formed an early Internet service provider in 1994 as its BBN Planet division.** Previously traded as "BBN" on the stock market, the company was purchased by [**GTE Corporation**] in 1997 as a wholly owned subsidiary.[49] BBN Planet was joined with GTE's national fiber network to become GTE Internetworking, **"powered by BBN".** When GTE and Bell Atlantic merged to become Verizon in 2000, the Internet service provider division of BBN was included in assets spun off as Genuity [(We call this "Genuity In,, 2000" and can be found here : Genuity Incorporated (2000) . There was also a **Genuity Incorporated**)] that existed from 1995 to 1997/8)] to satisfy Federal Communications Commission (FCC) requirements, leaving behind the remainder of BBN Technologies. **Genuity [(Genuity Incorporated (2000))] was later acquired out of bankruptcy by Level 3 Communications in 2003.**[50] In March 2004, Verizon sold the remainder of the company, by then known as BBNT Solutions LLC, to a group of private investors from Accel Partners, General Catalyst Partners, In-Q-Tel and BBN's own management,[51] making BBN an independent company for the next five years.
- In September 2009, Raytheon entered into an agreement to acquire BBN as a wholly owned subsidiary.[52] The acquisition was completed on October 29, 2009[53] and the company was valued at approximately $350 million.[54] BBN owned the domain bbn.com, the second oldest currently registered domain name on the Internet, which ran continuously from April 1985 to mid-December 2019.
- Digital Force Technologies (DFT) of San Diego, California was a wholly owned BBN subsidiary, purchased in June 2008, and spun out in 2018.[55]
- Former BBN employees have formed about a hundred startup companies with varying levels of official involvement, including Parlance Corporation and EveryZing.[56]

Locations and subsidiaries

As of 2013, BBN Technologies maintains offices in:[57]

- Cambridge Highlands, Cambridge, Massachusetts
- Columbia, Maryland
- St. Louis Park, Minnesota
- O'Fallon, Illinois
- Newport East, Middletown, Rhode Island near Naval Station Newport[58]
- Rosslyn, Arlington, Virginia near Washington, D.C.

Evidence Timeline

1997 (May 06) - Wired magazine - "GTE Takes Net Plunge with BBN Buyout"

See [HP004E][GDrive]

The nation's largest local phone company aims to expand its reach by purchasing one of the "backbone" Internet providers.

LEAPING HEADFIRST INTO the deep end of the Internet, **[GTE Corporation] said Tuesday that it will purchase Net pioneer BBN for US$616 million, and is partnering with Cisco Systems to develop new data services.**

The move helps position **[GTE Corporation]**, the nation's largest local phone company, as a full-service telecom outlet for corporate clients seeking Internet access and Web-site hosting, as part of its networking strategy. Such all-in-one packaging is seen as crucial to compete in today's increasingly complex and fast-changing telecom industry.

BBN spokesman Vaughn Harring said Tuesday that because his company's network helps account for nearly 80 percent of all traffic on the Internet, the increased capacity resulting from GTE's investment should result in faster service for the typical user. "The resources of a major telecom company were necessary to expand our service," he noted.

BBN has been around since the beginnings of the Net, when the system was still known as the Arpanet. It is considered one of the "backbone" Internet providers, along with MCI, Sprint, and WorldCom's UUNET Technologies.

Besides expanding its range of services offered, GTE is standing firm against AT&T as the leading long-distance carrier makes inroads to local phone customers. For the past two years, BBN has been the provider of networking systems for most of AT&T's Internet service. It is not yet known how the GTE buyout will affect AT&T's WorldNet operation.

AT&T holds a minority stake in BBN, and was believed to be interested in acquiring full control of the company. "Our relationship with AT&T is still being sorted out as a result of this news," Harring said.

[GTE Corporation] already claims some 100,000 subscribers to its Intelligent Network Services ISP. The alliance with Cisco aims to give more substance to this network, and to create new applications and services intended to meet the needs of major clients. GTE said its purchases of Cisco networking equipment for resale could reach more than $1 billion.

This has been an expensive week so far for GTE. On Monday, the company said it will buy a stake in Qwest Communications' coast-to-coast fiber-optic network for $485 million. Because of the acquisitions, GTE said it doesn't expect to meet projected 10 percent earnings increases for this year and next. Beyond 1999, though, the company is hoping that earnings will soar by as much as 15 percent a year.

"We think all this will mean a lot to Internet users across the country," said GTE spokesman Bob Brand. "Clearly we think this is a growth area for us."

GTE will soon commence a cash offer to acquire all outstanding shares in BBN for $29 a share. BBN reported an operating loss of $12.1 million for the quarter that ended on 31 March, compared with an operating loss of almost $30 million a year earlier.

GTE buys BBN for $616m

Deal for Internet pioneer puts firm ahead of AT&T, MCI

By Joann Muller
GLOBE STAFF

Stepping up an aggressive strategy to challenge nationwide telephone carriers, GTE Corp., the nation's largest local phone company, yesterday agreed to buy Internet pioneer BBN Corp. of Cambridge for $616 million in cash, or $29 per share.

The announcement came one day after GTE said it would pay $485 million for part of Qwest Communications Corp.'s nationwide fiber-optic network. The back-to-back moves enable GTE to offer a broad array of telecommunications services to consumers and businesses throughout the United States.

"Our goal is to be the first player to truly deliver local, long distance, Internet access and enhanced data services, all on a nationwide basis, all from one company, all on one bill, and all with a single point of contact for customer service," GTE chief executive Charles R. Lee told analysts.

The company, which is moving its headquarters from Stamford, Conn., to Dallas, also said it was teaming up with Cisco Systems Inc., a San Jose, Calif. networking company, to help manage its network and could buy more than $1 billion of Cisco products over five years.

Lee said the moves would pay off long-term for GTE shareholders, but cautioned that the heavy up-front investments would hurt short-term profits. He estimated that 1997 per-share earnings growth would be "flat to slightly positive," instead of the 10 percent earnings growth that had been expected before the moves were announced. The company said earnings could increase 13 percent to 15 percent a year starting in 1999.

GTE shares fell 1⅛, to 45, while BBN leaped 6¼, to 28⅞, on the New York Stock Exchange.

Under terms of the deal, which has been approved by directors of both companies, GTE will begin a cash tender offer for all

BBN, Page D2

GTE Corp.

Headquarters: Stamford, Conn.
Chairman/CEO: Charles R. Lee
Founded: 1918
Employees: 102,000
Stock: Down 1 1/8 to 45 on NYSE
Core business: Provides local telephone and mobile-cellular services to customers in 29 states, Canada, the Dominican Republic, and Venezuela. Also publishes telephone directories and supplies command, control, communications, and intelligence systems to US Department of Defense.

BBN Corp.

Headquarters: Cambridge
Chairman/CEO: George H. Conrades
Founded: 1948
Employees: 2,000
Stock: Up 6 1/4 to 28 7/8 on NYSE
Core business: Builds wide-area communications network systems. Also develops and markets packaged data analysis software products and performs contract research and development in computer, communications and acoustics.

From sound of things, BBN helped pioneer 'Net

By Hiawatha Bray
GLOBE STAFF

GTE Corp.'s $616 million investment in BBN Corp. will buy it a lot more than a major Internet service provider. In a sense, BBN is *the* Internet service provider, the company that constructed the ARPANET, the first primitive computer network that has grown into today's global web of data. Many companies, universities and government agencies collaborated to build the Internet, but no one participant is more closely identified with the project than BBN.

Yet when the company was founded as Bolt, Beranek and Newman in 1948, it wasn't involved with computers. Instead the company's specialty was acoustics – the study of sound. BBN designed the acoustics for the great hall where the United Nations General Assembly meets. And the company still does a great deal of sensitive work for the US Navy on ways to make surface ships and submarines quieter and harder to detect.

Given BBN's relationship to the Pentagon, it's easy to believe the popular story that the Internet was developed to ensure that military computer networks could survive a nuclear attack. But Frank Heart, who worked on the ARPANET for BBN, says the story is bogus.

Instead, the Internet grew out of an effort in the 1960s to allow computers at universities and research institutions to communicate with each other. BBN's involvement with the project began in the late 1950s, when the company hired a brilliant psychologist named J.C.R. Licklider.

"He was with the company only a matter of months, and he said, 'I want a computer,'" recalled Leo Beranek, cofounder of BBN.

"I asked what is it going to cost. He said $30,000. I said: 'My God, man, we've never bought anything more expensive than a water cooler. What are you going to do with it?' He said he didn't know but he knew that computers were the wave of the future."

Beranek got Licklider his computer, one of the first minicomputers from Digital Equipment Corp., and Licklider began hiring smart, ambitious students fresh from Harvard and MIT, and turned BBN into a center for computer research.

"BBN was thought of as sort of the third university. People would go from Harvard to MIT to BBN," said Katie Hafner, author of "Where Wizards Stay Up Late," a history of the Internet.

In 1962, Licklider left BBN to take a job at the Pentagon's Advanced Research Projects Agency. There he established the program that would eventually lead to the creation of ARPANET.

But it wasn't until 1969 that construction of ARPANET began. The goal was to connect computers at four major universities. BBN won the contract to attempt it – and they succeeded.

Even though the computers were connected, there wasn't a simple way to send messages. A BBN engineer named Ray Tomlinson solved the problem in 1972 by inventing electronic mail.

Now BBN is one of a handful of major firms that run the Internet's "backbone," the major communication lines that carry Internet traffic.

GTE buys Cambridge's BBN Corp. for $616m

■ BBN

Continued from Page D1

outstanding shares of BBN for $29 a share.

In acquiring BBN, GTE instantly acquires an Internet network that would have taken two years to build, said David Goodtree, an analyst with Forrester Research.

"That gives them a two-year jump" on competitors such as AT&T Corp. and MCI Corp., which are also scrambling to provide customers with Internet service.

And BBN, which created a forerunner of the Internet 28 years ago, is attractive to GTE because it has established customers and "a golden name," Goodtree said.

Building off of BBN's Internet base, GTE, with 1996 sales of $21 billion, expects to add $5 billion, to $8 billion in revenues over the next few years, officials said.

GTE's purchase of BBN is a blow to AT&T, because BBN has been providing Internet access to AT&T's business customers since June 1995.

AT&T spokesman Mike Miller said the deal with BBN was a short-term solution and that AT&T has always intended to move its customers to its own Internet backbone, which is now in place.

The two companies are negotiating an end to the contract, but neither Miller nor BBN chief executive George Conrades would comment on the talks.

It had been widely rumored for more than a week that AT&T was about to buy BBN. Those rumors helped lift BBN stock from 15¾ on April 21, to 22⅝ on Monday, the day before the GTE deal was announced.

Yesterday's deal with GTE overshadowed the release of BBN's third-quarter results, which showed revenues of $95.9 million, about 58 percent higher than a year ago, and an operating loss of $12.1 million.

Much of the revenue growth was due to growth in BBN Planet, BBN's Internet services division, which had revenue of $48.2 million, up 134 percent from a year ago. Nearly half that revenue came from helping America Online Inc. expand its network to meet rising demand.

[HN01EM][GDrive]

1997 (Sep 02) - GTE Press Release (archived with Verizon) - "GTE announces the launch of its new operating unit, GTE Internetworking; Internet pioneer BBN Corp. and GTE Intelligent Network Services combine to offer complete Internet Protocol networking services."

Source - [HC004N][GDrive]

IRVING, Texas -- **[GTE Corporation]** today announced the launch of GTE Internetworking, its new operating unit. GTE Internetworking includes the recently acquired **BBN Corp.**, which 28 years ago developed the ARPANET, the forerunner to today's Internet, and GTE Intelligent Network Services, which provides Internet services to residential and small business customers. The new operating unit will offer Internet services to residential and small business customers and Fortune 500 companies.

The acquisition of BBN and launch of GTE Internetworking are key components of **[GTE Corporation]**'s data strategy, one of a series of steps the company is taking to be a market-leading provider of voice, video and data services.

"GTE Internetworking is uniquely positioned to offer our customers the only complete, integrated Internet services using Internet Protocol (IP) networking technologies," said [**George Henry Conrades (born 1939)**], corporate executive vice president and president of GTE Internetworking. "We're building upon BBN's technological heritage and capabilities plus GTE's customer base, expanding national footprint and diversified distribution channels. Our mission is to help customers improve their business processes through the integration of IP technologies and telecommunications."

GTE Internetworking will work closely with other GTE units, including GTE Communications Corp., the company's new national sales, service and marketing unit, and GTE Network services, its regulated local exchange carrier.

GTE Internetworking will offer a full spectrum of internetworking services including dial-up and dedicated Internet access, high-performance Web hosting, managed security, network management, systems integration and Web-based application and integration services.

The new division will have responsibility for engineering and combining facilities such as data centers and network infrastructure as well as integrating new capacity on the company's high-speed, fiber-optic network being constructed by Qwest Communications Corp. Additionally, through BBN Technologies, its research and development arm, GTE Internetworking will continue to provide funded research and development services in the area of Internet Protocol networking, security, speech recognition and other advanced technologies.

With revenues of more than $21 billion in 1996, **[GTE Corporation]** is one of the largest publicly held telecommunications companies in the world. In the United States, GTE offers local and wireless service in 29 states and long-distance service in all 50 states. GTE was the first among its peers to offer "one-stop shopping" for local, long-distance and Internet access services. Outside the United States, where GTE has operated for more than 40 years, the company serves approximately 7 million customers. GTE is also a leader in government and defense communications systems and equipment, directories and telecommunications-based information services, and aircraft-passenger telecommunications.

1997 (Nov 13) - GTE Press Release (archived with Verizon) - "GTE Corp. to acquire Genuity, Inc."

Source - [HC004M][GDrive]

IRVING, Texas - **GTE Internetworking**, a subsidiary of **[GTE Corporation]**, today announced that it will acquire [Genuity Incorporated], a **subsidiary of Bechtel Enterprises**. The terms of the transaction were not disclosed. The acquisition is subject to customary closing conditions, including the expiration of applicable waiting periods under the Hart-Scott-Rodino Act. **The acquisition will be completed through GTE Internetworking's affiliate, [BBN Technologies, Incorporated].** It is anticipated that the transaction will be completed by the end of the year.

GTE Internetworking, already a leading provider of Web hosting, is pursuing its strategy of enabling customers to transfer their business applications to the Internet. Moving mission-critical business processes to the Web allows customers to broaden market reach, lower the cost of sales, distribution, and support, and transform the relationships between companies and their customers.

GTE Internetworking has more than a thousand Web hosting customers, including some of the busiest sites on the Web--ZD.Net, Four11, LA Times, Boston Globe, Tribune Corporation, and NBC Interactive. The combination of GTE Internetworking with Genuity will provide an expanded global footprint with 12 fully networked data centers, creating an organization with an unprecedented ability to provide distributed Web hosting services.

Genuity is a value-added provider of distributed application hosting solutions. Genuity has strategically located data centers and a sophisticated load-balancing technology, Hopscotch, which together ensure efficient delivery of data across the Internet. **Genuity's unique Hopscotch technology helps solve busy server problems, network congestion, and Internet latency to deliver the highest levels of performance.** Its customers include cnet, CMP Publications, Inc., Excite, InterTel, and MCA/Universal.

"With this acquisition we continue to build the critical set of assets necessary to advance our position as a trusted provider of the enabling infrastructure for Internet commerce. We are combining our high-speed national backbone with global reach, robust public and private peering relationships, advanced hosting and distributed application management with our security and systems integration expertise to enable customers to migrate mission critical applications and business processes to the network," said [George Henry Conrades (born 1939)], president of GTE Internetworking.

"Genuity's network technology, and most importantly, its people, are what give us the competitive advantage," said T. Geir Ramleth, president and CEO of Genuity. "The integration of our robust hosting infrastructure and powerful Hopscotch technology with GTE Internetworking's extensive resources will create a synergistic union. And our similar cultures and vision for the future provide a unique opportunity for customers looking to transform their businesses using Internet technology."

"Genuity's robust distributed application hosting architecture will be instrumental to GTE Internetworking as we continue to focus on delivery of the most advanced distributed network-centric solutions," said Mark Shull, vice president and general manager of GTE Internetworking's Network Centric Solutions group. "This combination allows us to build on our existing base of technology and expertise to provide Internet infrastructure services for electronic commerce."

About Genuity

Genuity is a subsidiary of Bechtel Enterprises, the development, financing and ownership affiliate of the Bechtel organization. Genuity is a value-added provider of distributed application hosting, access and security technologies that provide cost-effective, scaleable and highly reliable Internet infrastructure for commercial applications. With headquarters in San Francisco, Genuity also has data centers established in Chicago, Los Angeles, New York, Phoenix, San Jose, Washington, D.C. and London. Genuity is the creator of Hopscotch, a service allowing organizations to ensure the accessibility and performance of their mission-critical Internet sites by eliminating DNS look-up failures and solving Internet latency problems. For more information, please call 1-888-Genuity, or visit the company's World Wide Web site located at Genuity

About Bechtel Enterprises

Bechtel Enterprises, Inc. is the development, financing and ownership affiliate of the Bechtel organization, a premier global engineer - constructor. It is a leader in the privatized infrastructure market, with ownership interests in 9 companies and 29 projects in the power, water, transportation, telecommunications, and technology sectors. Since 1990 alone, Bechtel Enterprises has participated in arranging nearly $12 billion in project financing. For more information about Bechtel please visit the company's World Wide Web site at Bechtel

About GTE Internetworking

GTE Internetworking, a unit of GTE Corporation (NYSE:GTE), includes the recently acquired BBN Corporation, which 28 years ago developed the ARPANET, the forerunner to today's Internet, and GTE Intelligent Network Services, which provides Internet services to consumers and small businesses.

GTE Internetworking offers customers, from consumers to Fortune 500 companies, a full spectrum of Internet services and solutions including dial-up and dedicated Internet access, end-to-end network management, high-performance distributed hosting and applications solutions, managed security, and systems integration, for customers migrating their mission-critical business applications to the Internet. GTE Internetworking draws upon BBN's expertise in funded research and development of advanced technologies, including satellites, digital radio, multi-gigabit routers, security, and speech, and GTE's strong existing telecommunications services, including local and long distance, wireless, paging, video, research, and Internet. The address for the GTE Internetworking's home page is www.bbn.com.

1998 Aug 09 ... some BBN and Genuity in there too

Technology

Host of companies compete for business data storage

Hosts rent space on servers to hold programs, data or Web pages

By Jerry Ackerman
Boston Globe

It was only a matter of time, once interstate highways were built, before roadside diners gave way to fast-food chains and mom-and-pop motels were replaced by Holiday Inns, Radissons, and EconoLodges.

And so it is today along the Internet information highway, where a battle is being waged for market share in a roadside service called hosting — storage of Web page text and other content for retrieval by computer users at the click of a mouse.

Along with storage, some hosting companies see the field evolving to include rental of specialized business software, on a per-use basis, to customers who need these sophisticated programs but can't afford their upkeep.

The players range from giants — such as IBM Corp. and GTE Corp., which got into the game last year by buying BBN Corp. of Cambridge, Mass. — to Sage Networks Inc., a Cambridge start-up intent on building a national hosting company by buying smaller operators, and tiny Taylor Group of Bedford, N.H., which is starting from scratch.

The prize is a position in an industry that now has 4,000 to 5,000 hosting companies, which maintain the computers, called servers, that store Internet data. While no hosting company is believed to hold more than 2 percent of the market, these companies had combined sales of $400 million in 1997, according to Forrester Research Inc. of Cambridge. That number is expected to reach $1.9 billion in 1999 and $10.5 billion by 2002.

Tied to online shopping

Underlying this rapid growth is the surging interest in online shopping.

Electronic commerce last year chalked up more than $20 billion in sales, two-thirds of that in business-to-business transactions. Forrester figures that by 2002, this number could reach $350 billion, as existing on-line companies — ranging from home-based enterprises to pioneering bookseller Amazon.com — are joined by retailers such as L.L. Bean, Macy's, and Sears, Roebuck & Co.

Many of the largest of these "e-commerce" companies manage their own servers and networks. But some big players, and most of the small ones, contract this work to hosting companies.

These often are Internet service providers, many of them local companies whose primary business is providing dial-up phone connections to the Internet.

But along with providing connections, they sell service packages that — for an average fee of $300 to $400 a year and frequently much higher for large users — store Web pages, execute orders, and provide software to post purchases to buyers' credit cards while transmitting deposits to sellers' bank accounts.

Still waiting to be tapped, however, are thousands of firms that could sell their products or services over the Internet but haven't tried, and others that have yet to exploit the World Wide Web's full potential.

Software products are coming out almost daily to ease the way, says Joseph Barlett, an analyst with Yankee Group in Boston. "Most companies going with a hosting provider today are not very sophisticated," he observes.

But many that are very savvy are still hiring hosting companies to help guarantee service quality for both external Internet pages and intranet content meant only for employees' eyes.

Forrester says there were 12,000 such "complex sites" last year, and predicts this number will grow to 20,000 by 2002. Many will be managed in-house, but many more firms will be paying thousands of dollars a year to hosting companies.

Looking further ahead, the Internet is on the brink of opening up new ways for companies to conduct their own internal financial and production affairs, using software that until now only large Fortune 500 companies could afford.

Testing the market

Seeing this opportunity, major business software developers such as Lotus Development Corp. (an IBM subsidiary), Microsoft Corp., and Great Plains Software Inc. are market-testing versions of their brand-name products for small companies — firms with 500 or fewer employees — to use via the Internet.

The concept calls for hosting companies to install master copies of such specialized software, and then rent access to users. International Data Corp. of Framingham, Mass. says 25 percent of 900 companies in a recent survey said they liked the idea for payroll processing; others saw a need for such services for economic forecasting or supply-chain management capabilities that they now lack.

"The capabilities in this field are just emerging," said Steven Brand, Lotus' manager for small business applications.

Hosting as a growth business is sharply defined in the "roll-up" strategy being pursued by Sage Networks, which since March has spent more than $20 million to buy eight hosting companies from coast to coast.

These acquisitions — in Atlanta, New York, Washington, D.C., Los Angeles and San Jose, Calif., — form the backbone of what Sage intends to be a national company that can establish brand identity in a now-fragmented market.

"We actually think that through consolidation you can build a large international company," said Bradley Feld, cochairman and one of Sage's founders.

Could become No. 2

By January, he said, Sage hopes to have between 15 and 25 acquisitions under its wing, with more planned for 1999. "We are now one of the top 10 hosting companies in the country and by the end of this year should be one of the top two."

Not that this represents a big market share.

Sage says it has tens of thousands of clients at its companies; some estimate that number is less than 40,000. The firm believed to be the nation's largest hosting operator, Hiway Technologies Inc. of Boca Raton, Fla., claims 87,000 customers.

And the runner-up, Verio Inc., which has 125,000 customers buying connections to the Internet, may be able to claim about 65,000 as hosting customers, based on rules of thumb that industry veterans say are commonly accepted.

Both Hiway and Verio also are pursuing roll-up strategies. Verio, based in Englewood, Colo., is publicly traded. Hiway has an initial public stock offering planned for this year.

Sage's buying spree has included a large, high-speed computer center near Washington, D.C., purchased from IBM Corp., to be the linchpin in the company's operations. A second center is being built in Atlanta, where two of its operating units are also based, at a projected cost of $1 million.

Sage's money comes mostly from a venture fund managed by a New York investment bank, Charterhouse Group International Inc. Patricia Riley, managing director, says Charterhouse has "well over $40 million in pure equity" committed to Sage.

"The way I look at this, you have a market that is growing exponentially and a business that creates profits quickly," she said. An IPO is planned, but no timetable has been set.

GTE, an international telecommunications giant with $23 billion in revenues in 1997, paid $616 million last year to buy BBN, which in 1969, as Bolt, Beranek & Newman, launched the forerunner of the Internet for the U.S. Defense Department.

Today, BBN operates under the name GTE Internetworking, still running key portions of the Internet and selling services to support its parent company's drive to compete against AT&T Corp. and MCI Communications Corp.

"We're shooting to be a leader in the hosting market," says John Vincenzo, a company spokesman.

Still under the BBN flag at the time, the company began commercializing hosting operations at its 11 U.S. locations in 1995, according to senior product manager Christine Silva.

Noticing smaller firms

Going first after large corporations that needed backup storage capacity, the company last year expanded sales efforts to include small and mid-size firms — companies with fewer than 500 employees or sales less than $100 million. Analysts say this sector is where electronic commerce is growing the fastest.

Vincenzo said GTE now has more than 1,000 hosting customers. It acquired one smaller hosting company, Genuity Inc., of San Francisco, late last year primarily because it had a data center that could be a GTE West Coast operations center. More acquisitions are possible.

Coming from a different direction, Dan Taylor, a Bedford, N.H., software consultant, sees new computer hardware technology paving the way for hosting centers to provide small businesses with payroll, engineering, manufacturing control, sales systems, and other software that they previously couldn't afford.

Taylor says the licensing fees for these high-end products, which big companies take for granted, weren't the problem.

It was the cost of hiring someone to install the software, manage its use, and install upgrades, in as many as 200 desktop computers in a medium-sized firm. These information systems managers, who can earn $80,000 to $90,000 a year, also must be available around the clock to solve problems.

The new hardware that is altering this picture is called "thin client" technology, a name that refers to the fact that those desktop terminals are stripped of their software storage capabilities — thinned down — to become terminals that connect to servers that function as a central computer.

May sound familiar

This may sound familiar to anyone who used a computer before the PC revolution , when computer terminals were wired to IBM, Digital Equipment, or similar mainframe computers that were tended behind closed doors by technicians. "The industry is calling it recentralization," says Taylor of this return to the past.

But by requiring that software be installed and maintained only at the servers, operating costs plummet and fancy software becomes more affordable.

Taylor this fall will launch his first application of this approach, installing accounting software in host servers at his company's offices that nearby New Hampshire College will be able to tap, via the Internet, for teaching its business courses.

Simultaneously, his company, The Taylor Group, is discussing the hosting of specialized business applications with New Hampshire's largest private manufacturing company, Cabletron Corp. of Rochester, and with a Massachusetts health care firm, Physicians Quality Care Inc. of Waltham, Mass.

Anticipating success in these pilot installations, Taylor recently bought a 9.5 acres of land in Bedford where he plans to build new offices for his 75-employee company — with 10,000 square feet of space set aside for a hosting center.

2005 (May 12) - BusinessWire - BBN Technologies Appoints George Conrades, Executive Chairman of Akamai Technologies, to Board of Directors

Source - [HW0051][GDrive]

CAMBRIDGE, Mass.--(BUSINESS WIRE)--May 12, 2005--BBN Technologies, a leading provider of advanced technology and research and development, announced today that [George Henry Conrades (born 1939)], executive chairman of [Akamai Technologies, Incorporated], has been appointed to BBN's Board of Directors. Mr. Conrades served as the CEO of [**BBN Technologies, Incorporated**] from 1994 to 1997.

"I'm delighted to join the Board of Directors of BBN Technologies, a highly respected organization renowned for developing innovative solutions to some of the world's most challenging problems," said Mr. Conrades. "It's a privilege to be reunited with BBN's world-class scientists and their excellent work."

“George brings to the BBN board an outstanding record of technology and business leadership together with a deep understanding of and appreciation for BBN's business, culture, and core values”

The BBN Board of Directors also includes: Tad Elmer, BBN's president and CEO; David Fialkow and Ken Novack, managing director and advisory board member of General Catalyst Partners, respectively; Jim Breyer and Kevin Efrusy of Accel Partners; and Anita K. Jones, the Lawrence R. Quarles Professor of Engineering & Applied Science, and Professor of Computer Science in the School of Engineering and Applied Science at the University of Virginia.

"George brings to the BBN board an outstanding record of technology and business leadership together with a deep understanding of and appreciation for BBN's business, culture, and core values," said Mr. Elmer. "His counsel will help us grow and prosper."

[George Henry Conrades (born 1939)] was named Chairman and Chief Executive Officer of Akamai in April 1999, bringing a broad range of business experience in the computing, Internet, telecommunications, and media industries. Mr. Conrades became Executive Chairman of Akamai in April 2005.

Before joining Akamai, Mr. Conrades was Executive Vice President and President of GTE Internetworking following the firm's acquisition of BBN Corporation in 1997. At [GTE Corporation], he was responsible for creating GTE Internetworking and leading GTE's rapid growth in the data and Internet business, including integrated telecommunications services.

From 1994 until GTE's acquisition of BBN, [George Henry Conrades (born 1939)] served as CEO of BBN, where he built BBN Planet into one of the industry's top-tier ISPs. BBN designed, built, and deployed the first four nodes of the ARPANET, the forerunner to today's Internet.

Mr. Conrades currently serves as a venture partner at Polaris Venture Partners, an early stage investment company.

Bell Textron Corporation

The current Wiki : (https://en.wikipedia.org/wiki/Bell_Helicopter)

Capture- 2019-06-12-wikipedia-bell-helicopter.pdf /

Bell Aircraft

The company was founded on July 10, 1935 as Bell Aircraft Corporation by Lawrence Dale Bell in Buffalo, New York. The company focused on the designing and building of fighter aircraft. Their first fighters were the XFM-1 Airacuda, a twin-engine fighter for attacking bombers, and the P-39 Airacobra. The P-59 Airacomet, the first American jet fighter, the P-63 Kingcobra, the successor to the P-39, and the Bell X-1 were also Bell products.[2]

In 1941, Bell hired Arthur M. Young, a talented inventor, to provide expertise for helicopter research and development. It was the foundation for what Bell hoped would be a broader economic base for his company that was not dependent on government contracts. The Bell 30 was their first full-size helicopter (first flight December 29, 1942) and the Bell 47 became the first helicopter in the world rated by a civil aviation authority, becoming a civilian and military success.[2]

Bell Helicopter

Textron purchased Bell Aerospace in 1960. Bell Aerospace was composed of three divisions of Bell Aircraft Corporation, including its helicopter division, which had become its only division still producing complete aircraft. The helicopter division was renamed **Bell Helicopter Company** and in a few years, with the success of the UH-1 Huey during the Vietnam War, it had established itself as the largest division of Textron. In January 1976, Textron changed the name of the company again to **Bell Helicopter Textron**.[3]

Bell Helicopter has a close association with AgustaWestland. The partnership dates back to separate manufacturing and technology agreements with Agusta (Bell 47 and Bell 206) and as a sublicence via Agusta with Westland (Bell 47).[4] When the two European firms merged, the partnerships were retained, with the exception of the AB139, which is now known as the AW139. As of 2014, Bell and AW cooperate on the AW609 tiltrotor.[5]

Bell planned to reduce employment by 760 in 2014 as fewer V-22s were made.[5] A rapid prototyping center called XworX assists Bell's other divisions in reducing development time.[6]

The company was rebranded as "Bell" on February 22, 2018.[7]

https://www.bellflight.com/company/history/1960-1969

1960

- Ten Bell HU-1A U.S. Army medical evacuation helicopters are airlifted to Chile for Operation Amigo.
- Textron Inc., of Providence, RI, purchases the defense activities of Bell Aircraft Corporation and sets up Bell Aerospace Corporation as a wholly-owned subsidiary with three operating divisions: Bell Helicopter Corporation; Bell Aerospace Systems Corporation; and Hydraulic Research and Manufacturing Corporation.
- An 18-foot Air Cushion Vehicle designed by Bell Aerosystems is turned over to the U.S. Navy for test and evaluation.
- U.S. Army pilots flying a Bell HU-1 set 7 helicopter world records, including a non-stop flight distance of 441.74 miles, 3 speed records, and 2 speed climbing records. The HU-1 reaches 10,000 ft. in less than 4 minutes and 24,250 ft. in just 12 minutes.
- Edwin J. Ducayet becomes president of the company, replacing Harvey Gaylord.

1961

- The first aircraft to be powered by a 250 shp T-63 engine, the U.S. Navy's Bell HUL-1M, takes its initial flight.
- Al Averill, flying a Bell 47J-2, sets a helicopter world record in Class E-1.c for 100 kilometer speed in a closed circuit. His speed of 107.081 mph breaks a Russian-held record.
- Bell Aerosystems develops the "Reaction Control System" successfully used in NASA's Mercury program, the first program sending man to space.
- Lou Hartwig, flying a Bell 47G, sets three class E-1.b world records during one flight: non-stop distance of 631.436 miles in a closed circuit; 500 kilometer speed of 73.985 mph in a closed circuit; and 1,000 kilometer speed of 73.351 mph in a closed circuit. All three records are the first to be set in their respective categories and weight classes.
- Dr. Dora Jean Dougherty Strother, flying a Bell 47G-3, sets two female helicopter world records: altitude without payload of 19,385 feet and non-stop distance of 405.83 miles in a straight line without payload. Both accomplishments break previous Russian-held records.
- The Royal Australian Air Force (RAAF) places a $4 million order for eight Bell 204B/HU-1Bs.
- Bell Aerospace Corporation announces it has built and demonstrated the "Rocket Belt" for mankind's first free flight.
- A new range of high-altitude capabilities for helicopter operations is discovered in a Pikes Peak test by the new turbo-supercharged Bell 47G-3B.
- The Bell OH-4 is announced as one of three Light Observation Helicopter (LOH) design competition winners.
- An unofficial helicopter endurance world record is set by the Bell HTL-6 for a flight lasting 72 hours and 2 minutes at the U.S. Navy's Ellyson Field, Pensacola, FL.
- A $6 million procurement contract is awarded for five Bell YOH-4 LOH (Light Observation Helicopter) prototypes. Bell Helicopter later loses the contract, but uses the prototype as the base for the future Bell 206 JetRanger.
- Bell Helicopter announces the receipt of $70 million in new government business. This includes the Bell HO-4, Royal Australian Air Force (RAAF) contracts, and follow-on production of Bell HU-1B and HU-1D U.S. Army helicopters.

1962

- Mitsui & Co. Ltd. licenses manufacturing rights to the Bell 204 in Japan.
- The Bell HU-1 designation is changed to the Bell UH-1 as a result of a newly revised military designation system.
- Bell Aerosystems announces that it will

- Bell Aerosystems announces that it will build a 22-ton, 62-foot Hydro-Skimmer for the U.S. Navy under a $2 million contract. This is the largest air cushion vehicle ever constructed in the U.S.
- The Bell UH-1E wins the competition for the U.S. Marine Corps' Assault Support Helicopter (ASH) production contract.
- Capt. Boyce Buckner of the U.S. Army sets a world record in a Bell YHU-1D (Model 533) by climbing to 6,000 meters (19,686 feet) in 5 minutes and 51 seconds.
- Bell Aerospace Corporation is awarded a contract to design and build the X-22A VTOL for the U.S. Navy's portion of the Tri-Service Assault Transport Research Program.
- U.S. Army Lt. Col. Leland Wilhelm sets a world record in a Bell YHU-1D (Model 533) by climbing to 3,000 meters (9,843 feet) in 2 minutes and 17 seconds.
- Capt. W. F. Gurley of the U.S. Army sets a world record in a Bell YHU-1D (Model 533) by flying 1,000 kilometers in a closed circuit at an average speed of 134.9 mph.
- The Bell YOH-4 prototype, nicknamed "Ugly Duckling," makes its first flight.
- Bell Aerosystems announces the construction of a radiation-cooled, high-performance rocket motor.
- The Bell D-255 design study leads to a full-scale mock-up of the Iroquois Warrior combat helicopter for the U.S. Army.

1963

- In Morocco, the Bell UH-1B carries 32 flood refugees and a crew of four in one flight.
- The high-performance Bell UH-1B flies more than 170 mph.
- A Federal Aviation Administration certificate is received by the Bell 204B.
- The U.S. Army accepts its first Bell UH-1D.
- Bell Helicopter wins a competition to build the Bell UH-1F for the U.S. Air Force.
- A $108,320,407 U.S. Army contract is announced by Texas Congressman Jim Wright for Bell UH-1B and UH-1D ships.
- The modified Bell 47G-2A-1, nicknamed "Wing Ding," flies for the first time.
- First flight occurs for the Bell 205A.
- Bell Aerosystems announces an $11.2 million subcontract from Grumman to develop ascent rocket engines for NASA's Lunar Excursion Module (LEM) of Project Apollo.
- Bell Aerosystems acquires the rights to manufacture and sell hovercraft in the U.S. from Westland Aircraft Ltd. and Hovercraft Development Limited of England.

1964

- Bell Helicopter receives a $7,662,257 production contract from the U.S. Marine Corps for Bell UH-1Es.
- A new Engineering and Research facility opens at Bell Helicopter's Hurst, TX, plant.
- The 850th Bell UH-1 is delivered; first flight of Bell UH-1F series occurs; and the first delivery of Bell UH-1E is made to an operational U.S. Marine Corps unit.
- An order for 150 Bell 47G-3B-1s is placed by the British Army.
- The modified Bell YUH-1B flies 222 mph in an unofficial new world speed record.
- A $5,762,850 contract is awarded for 103 Bell 47G-3B-1s, modified to trainer configuration, for the U.S. Army.
- The first operational Bell UH-1F is delivered to the U.S. Air Force.
- Bell Aerospace is praised by NASA for its accelerometer package aboard the Ranger 6 moon shot. NASA states that the package "contributed greatly to the complete guidance success" of the moon mission.
- Flown by U.S. Army pilots, the YUH-1D establishes 20 Fédération Aéronautique Internationale (FAI) World Records, all for turbine-powered helicopters without payload.
- Bell Aerosystems began ground testing the Lunar Landing Research Vehicle (LLRV) at NASA's Flight Research Center, Edwards, CA.
- The Bell Rocket Belt performs 396 flights throughout the year before an estimated 1.8 million spectators, including flights at the New York World's Fair.
- Bell Helicopter receives an order for 720 Bell UH-1s. This $100 million order is the largest Bell UH-1 order to date.

1965

- The U.S. Army takes delivery of its first Bell TH-13T instrument trainers.
- Bell Aerosystems' Agena engine is used to send NASA's Ranger 9 on moon photo missions.
- The U.S. Air Force elevates Bell Aerosystems to prime contract status, calling for the delivery of all Agena engines directly to the Air Force.
- Bell Helicopter sets a production record believed to be unprecedented in the aerospace industry, with 100 consecutive months of on-schedule deliveries to U.S. Government entities.
- A new vertical and/or short take-off and landing (V/STOL) trailing rotor convertiplane design is unveiled.
- Selection of the Bell UH-1D is approved by the West German Parliamentary Committee in Bonn, which places an order for 406 helicopters, valued at approximately $125 million.
- The twin-turbine powered Bell UH-1D is developed and takes first flight.
- Bell Helicopter receives additional U.S. Army orders for 720 helicopters (225 Bell UH-1Bs and 465 Bell UH-1Ds).
- Bell Helicopter announces the development of the Bell AH-1 Cobra, a highly modified Bell UH-1B derivative featuring a streamlined fuselage, armament package, and dedicated crew for flying and weapon system control.
- Known also as the HueyCobra or Snake, the Bell AH-1 Cobra makes its first flight. The aircraft later became the backbone of the U.S. Army's attack helicopter fleet.
- Bell Aerosystems announces a Federal Government transportation project using two SK-5 Air Cushioned Vehicles to shuttle passengers between the Oakland and San Francisco airports.
- As an addition to its 1966 commercial line, Bell unveils the new five-seat, turbine-powered Bell 206 JetRanger. It will fly at speeds in excess of 140 mph and will carry a 1,500-lb useful load.
- he new Bell AH-1 Cobra records a sustained level flight cruise speed of 200 mph. Until this time, the official world speed record for its weight class was 180.1 mph.
- A $297,000 contract is awarded for a preliminary design study for a new research VTOL rotary-

wing composite aircraft.

- The third and final SK-5 Air Cushioned Vehicle is produced for the U.S. Navy and shipped to Coronado, CA.
- The Bell X-22A V/STOL aircraft number 2 is rolled out.

1966

- Rollout of the first Bell 206 JetRanger takes place at the Hurst, TX, facility. The flight test program is initiated with the first flight occurring on the same day. Successfully derived from the prior YOH-4 "Ugly Duckling," with a stylistic redesign accredited to Dwayne Jose, Vice President of Marketing, the Bell 206 becomes the most successful commercial helicopter in history.
- The U.S. Army awards Bell Helicopter a contract for 110 production Bell AH-1s.
- Testing takes place for a three-blade spacecraft rotor recovery system that would allow astronauts to reduce landing speeds and control choice of landing sites.
- A $249,457,443 contract is received for 2,115 Bell UH-1 Iroquois, the largest contract in Bell history and largest ever awarded by the U.S. Army Aviation Materiel Command.
- The Federal government's transportation project, using two Bell SK-5's Air Cushioned Vehicles, successfully concludes in San Francisco, logging 179,700 passenger miles and carrying 13,600 passengers.
- Altitude testing of the modified multiple restart Gemini/Agena rocket engine is carried out in preparation of Gemini VIII.
- Halvorson-Lent's Trans-Canyon Pipeline Project nears completion at the Grand Canyon. It is one of the greatest construction challenges in history, using helicopters exclusively to lay water pipe in the floor of the canyon.
- The U.S. Army awards Bell Helicopter a $44,377,858 contract for 708 Bell UH-1Ds.
- A unique radar antenna that is built into the blade of a helicopter is successfully tested.
- Two new "flying devices" – the Flying Chair and Pogo Stick – are developed and announced.
- The delivery of three Bell UH-1Ds completes an order for 11 helicopters, constituting New Zealand's first armed forces rotary-wing fleet.
- First flight occurs for the X-22A V/STOL research airplane, featuring four ducted fans that can rotate together between vertical and horizontal positions for various flight modes.
- The U.S. Army continues to expand its fleet by placing a $21,795,000 order for 210 additional Bell AH-1s.
- Three Bell SK-5 Air Cushioned Vehicles (ACVs) arrive for the U.S. Navy operation near Moc Hoa, South Vietnam. The three craft are able to access areas that were previously inaccessible, successfully destroying and capturing Viet Cong supplies and soldiers.
- The Bell Aerosystems Lunar Landing Research Vehicle (LLRV) sets a new flight record by staying aloft for 9.5 minutes.

1967

- The first two Bell 206A JetRanger deliveries take place during the Helicopter Association of America (HAA) convention. The first is purchased by Harry Holly of Hollymatic Corp. in Park Forest, IL, and the second by the National Helicopter Service & Engineering Co. of Van Nuys, CA.
- Canadian operators Dominion Helicopters Ltd. and Pegasus Airlifts establish a joint air taxi service using four Bell 206 JetRangers and four Bell 47J-2s at the Canadian International Exposition of 1967.
- The Brazilian Air Force purchases its first Bell UH-1Ds, acquiring six aircraft to supplement its Bell 47G and Bell 47J fleets.
- Helicopter Sales Pty. Ltd., a Bell Helicopter dealer in Australia, receives first export delivery of a production Bell 206A.
- The Los Angeles County Fire Department becomes the first municipality to purchase a Bell 204B.
- “Cobra” is officially adopted by the U.S. Army as its name for the Bell AH-1.
- The first production Bell AH-1G is delivered to the U.S. Army.
- A U.S. Army contract is awarded for 141 Bell TH-13T instrument trainers.
- The West Germany Federal Defense Force accepts the first of 380 Bell UH-1Ds assembled in West Germany under a co-production contract between Bell Helicopter and Dornier, GmbH.
- Ten Bell UH-1Ds are ordered following the aircraft’s selection as the first helicopter to be used in the all-around ground support operations of the Canadian Forces (Army, Navy, Air Force).
- Bell Helicopter announces a new 15-seat commercial model, the Bell 205A, to be available during 1968. It is the largest helicopter ever manufactured by the company at that time.
- The U.S. Army announces it has deployed the Bell AH-1 Cobra in Vietnam. The first combat kill is credited to Maj. Gen. George Seneff, commander of the First Aviation Brigade, who destroyed a sampan (river boat) with four Viet Cong onboard.
- U.S. Vice President Hubert H. Humphrey rides in a SK-5 ACV down Niagara River from Buffalo to Bell Aerosystems’ Wheatfield, NY, plant. He also witnesses a ducted fan transition on the X-22A aircraft, a double “rocket belt” flight, and tours the facility. Neil Armstrong, who is also visiting, gives a detailed explanation of Bell’s Lunar Landing Training Vehicle to the Vice President.
- A double Rocket Belt flight by Bob Courter and Bill Suitor is aired on national television during the first Super Bowl football game in Los Angeles.
- Over 4,000 employees and officials witness the X-22A’s first successful public flight.

1968

- The U.S. Navy selects the Bell 206 JetRanger as its light turbine trainer and orders 40 for delivery by end of year.
- Bell Aerosystems' Lunar Module ascent engine is fired into orbit during the Apollo 5 flight.
- Bell Helicopter announces it will open an Overhaul & Modification Center in Amarillo, TX, occupying buildings being phased out by the U.S. Air Force. William Humphrey is named general manager of the facility, which will repair and refurbish battle-damaged U.S. Army helicopters.
- Seven Bell 206 JetRangers and six more Bell UH-1Ds are ordered by the Brazilian Air Force to update and expand its helicopter forces.
- Bell Aerosystems' first production line Air Cushioned Vehicle (ACV), an SK-5 for the U.S. Army, rolls off the assembly line.
- The Bell 206 JetRanger is named a winner of the U.S. Army's re-opened light observation helicopter (LOH) competition. Bell Helicopter is awarded a $123 million contract for 2,200 aircraft with deliveries scheduled between 1969 and 1972.
- Development of a twin-engine Bell UH-1, powered by United Aircraft of Canada Pratt & Whitney PT6T-3 turbines, is approved by the Canadian Government. The contract is expected to lead to Canada equipping its armed forces with the new aircraft.
- The 10,000th helicopter, a Bell JetRanger, delivers to Petroleum Helicopters, Inc. (PHI), the world's largest helicopter operator.
- Selected for use as its advanced helicopter trainers, the U.S. Navy orders 45 Bell TH-1Ls and Bell UH-1Ls.
- The U.S. Marine Corps orders 49 Bell AH-1s, becoming the second branch of the U.S. military to buy the high-speed gunship.
- A contract for 900 Bell UH-1Hs is awarded by the U.S. Army, making it the second largest order ever of the UH-1.
- The New York City Police Department, a pioneer in the use of helicopters by law enforcement agencies, marks the 20th anniversary of its first Bell helicopter purchase. NYPD has an all-Bell helicopter fleet.
- An announcement is made that the Bell 212, the first twin-engine, medium-sized, commercial helicopter, will be ready for delivery in 1970.
- Bell Aerospace's body-controlled pogo vehicle, which the operator maneuvers simply by leaning in the direction he wishes to go, registers a successful first flight.
- The upgraded Bell UH-1, nicknamed "Huey Tug" in light of its upgraded drive train and power plant, larger rotor, and increased lifting capacity, flies as the Bell 211.
- Apollo 7, the first manned flight in the U.S. lunar landing program, launches into Earth's orbit for an 11-day mission. A total of 24 Bell Aerosystems propellant positive expulsion tanks will supply fuel and oxidizer to the spacecraft's reaction control systems and to the S-IVB third stage's auxiliary propulsion system.

1969

- Bell Helicopter's compound research helicopter, a highly modified Bell UH-1, attains a speed of 316 mph in level flight. This is an unofficial speed record and has remained unchallenged.
- The U.S. Air Force awards Bell Helicopter a contract to define the design characteristics of a folding prop-rotor aircraft.
- Bell Helicopter announces that its twin-engine Bell 212 flight test program is well underway.
- The U.S. Army accepts the first Bell OH-58A light observation helicopter. The Bell OH-58 is officially named the Kiowa.
- A licensing agreement for co-production of the Bell 205 is signed by the People's Republic of China and Bell Helicopter.
- The U.S. Air Force, U.S. Navy and U.S. Marine Corps place orders for the new twin-engine Bell HU-1N. The total includes 79 for the Air Force, 40 for the Navy and 22 for the Marines.
- Fifty twin-engine Bell CUH-1Ns are ordered by the Canadian government for its armed forces.
- The U.S. Marine Corps' Bell AH-1J Sea Cobra, a twin-engine version of the U.S. Army Cobra, is unveiled by Bell Helicopter before a gathering of armed forces representatives. The U.S. Marine Corps orders 49.
- The U.S. Navy accepts its first Bell UH-1L utility helicopter from Bell Helicopter for deployment to the Pacific Fleet.
- A U.S. Army announcement is made that the first deployment of the Bell OH-58A Kiowa to battle units in Vietnam has occurred.

https://www.bellflight.com/company/history/1970-1979

The History of Bell Helicopter: 1970 - 1979

1970

- The U.S. Army awards a contract for 170 additional Bell AH-1s with an initial funding of $5 million.
- With $20 million in initial funding, the U.S. Army orders 289 Bell UH-1Hs

- With $20 million in initial funding, the U.S. Army orders 287 Bell UH-1Hs.
- Selected by the Canadian government as the light observation helicopter for the Canadian Armed Forces, 74 Bell OH-58As are ordered.
- The U.S. Air Force formally accepts its first Bell UH-1N Twin Huey at Eglin AFB, FL.
- FAA certification is received for the Bell 212.
- **The Bell 214 is initiated, built, and has first flight. Also known as the "Huey Plus," the Bell 214 was conceived from a request by the Imperial Iranian Air Force.**

1971

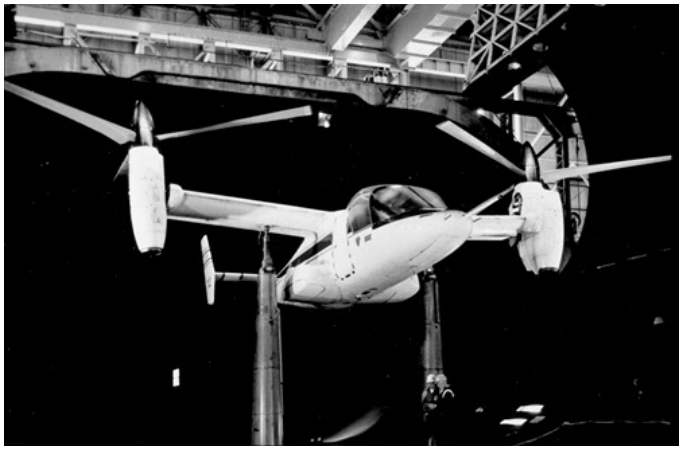
- The U.S. Army contracts with Bell Helicopter to provide 300 Bell UH-1H helicopters, funded at $37.5 million.
- Delivery of the first Bell UH-1N Twin Huey is taken by the U.S. Marine Corps.
- The Bell 206B JetRanger II, powered by an Allison 250-C20 engine, receives FAA type certification.
- Acceptance of the first of 50 twin-engine Bell CUH-1Ns is made by the Canadian Armed Forces.
- In honor of the company's 20th year in Texas, the mayor of Fort Worth proclaims "Bell Helicopter Week."
- The first Bell 206B JetRanger II production model delivers to Okanagan Helicopters Ltd. of Canada.
- The Bell 212 receives FAA Category A certification.
- Presentation of the Bell 207 Sioux Scout prototype from 1963 to the U.S. Army Aviation Museum in Ft. Rucker, AL, occurs.
- The first of 74 Bell COH-58A light observation helicopters is delivered to Canadian Armed Forces.

1972

- Commercial and international marketing break all-time records with firm orders for 105 helicopters valued at $23 million.
- Bell Helicopter receives a $24,732,793 contract from the U.S. Army as prime systems integrator of the Improved Cobra Armament Program (ICAP). The contract calls for integrating the tube-launched, optically tracked, wireless-guide (TOW) system into eight U.S. Army Bell AH-1Gs.
- Twenty-four Bell UH-1Hs are added to a co-production contract between Bell Helicopter and the People's Republic of China.
- The U.S. Air Force takes delivery of the first two of 30 Bell HH-1H local base rescue helicopters.
- Petroleum Helicopters Inc. (PHI) orders 33 new Bell helicopters, valued at $5 million. This is the largest single commercial helicopter order in history.
- Bell Helicopter announces a breakthrough in the elimination of helicopter vibration by suspending the fuselage from a "nodalized" beam.
- Four Bell UH-1s are assigned to launch a site recovery force team during the last programmed Apollo lunar mission – the first night launch from Kennedy Space Center.
- Texas Congressman Jim Wright announces the sale of 287 new Bell 214As and 202 Bell AH-1Js to Iran through the U.S. Government. Total value of the purchase exceeds $500 million.
- James F. Atkins becomes president of the company, replacing Edwin J. Ducayet.

1973

- The U.S. Army orders 74 additional Bell OH-58A helicopters. The contract is valued at $6.5 million.
- An additional 20 Bell AH-1J SeaCobras are ordered by the U.S. Marines. The contract is valued at $5 million.
- The U.S. Army orders 180 Bell UH-1H helicopters. The contract is valued at $27.4 million.
- Under an option, the U.S. Army orders 16 additional Bell UH-1H helicopters. The contract is valued at $2.6 million.
- The 1,000th Bell 206B JetRanger II is delivered.
- In a contract valued at $9.5 million, the U.S. Navy orders 24 additional Bell UH-1N helicopters.
- Bell Helicopter is awarded a NASA/U.S. Army contract to build and test two tiltrotor research aircraft. Estimated cost of the four-year program is $28 million.
- The U.S. Army awards Bell Helicopter a $44.7 million contract to initiate development of an Advanced Attack Helicopter system. Total development funds could reach $120 million. The three-year program calls for Bell Helicopter to design and fabricate two flying prototypes and one ground test vehicle. The Army will select the production contractor for an estimated $500 million run in three to five years.
- A single-month record of 70 commercial aircraft deliveries is achieved.



1974

- Bell Helicopter receives a $59.2 million U.S. Army contract to modify 101 of the U.S. Army's existing Bell AH-1G Cobras into Bell AH-1Q TOW Cobras.
- A Bell Helicopter Supply Center is established at Amsterdam Airport Schipol, The Netherlands.
- The Bell 214A developed in partnership with Iran for offshore use makes its first flight.
- A ceremony at the Hurst, TX, plant commemorates the delivery of the 20,000th Bell helicopter.
- The first Bell Helicopter AH-1J SeaCobra arrives in Japan.
- Initial flight is made by the new Bell 206L LongRanger. An experimental Bell 206LM with a four-blade rotor is developed.
- The U.S. Army awards Bell Helicopter a modification to two existing contracts, calling for 54 additional Bell UH-1H utility helicopters, valued at nearly $12 million.
- Under a $54 million U.S. Army contract, 189 additional Bell AH-1 helicopters are to be modified to the Bell AH-1Q TOW/Cobra configuration.

1975

- An Iranian Bell 214A sets five world records in altitude and time-to-climb categories.
- Delivery of the first 290 production Bell AH-1Q TOW Cobra helicopters is made to the U.S. Army at Hurst, TX.
- The Bell 206L LongRanger receives FAA certification.
- First flight of the Bell YAH-63 prototype occurs.
- Bell Helicopter achieves a major technical breakthrough when the main transmission of a Bell 214A runs for 1.5 hours without oil.
- The government of Iran names Bell Helicopter as partner in a joint venture organized to establish a modern helicopter industry in Iran. The program includes co-production of 400 Bell 214s.
- A $37 million production contract for 44 Bell AH-1Ss (the improved version of the AH-1G) is awarded to Bell Helicopter by the U.S. Army.

1976

- Bell Helicopter Operations Corporation is formed to carry out a long-term co-production and joint venture agreement with the Iranian government.
- The company adopts a new name, Bell Helicopter Textron.
- FAA certification is received for the Bell 214B.
- Ceremonies for the 25th anniversary celebrating the Hurst, TX, plant occur.
- The Bell AH-1T prototype (improved AH-1J) makes its first flight.
- Delivery of the first of 198 Bell AH-1Ss modified from existing aircraft is made to the U.S. Army at Bell Helicopter's Amarillo, TX, plant.
- The 2,000th Bell 206B JetRanger II is delivered to the McDonald's Corporation. Delivery was accepted by founder Ray Kroc.
- First flight occurs for the Bell 222 prototype.
- The U.S. Army awards Bell Helicopter Textron a production contract for 22 additional Bell AH-1Ss, increasing the total order to 66.
- The first NASA/U.S. Army Bell XV-15 tiltrotor is rolled out at Bell Helicopter's Flight Research Center.
- Dedication ceremonies for Bell Helicopter's Machining Center are held in Grand Prairie, TX.
- A contract is awarded for 82 additional Bell AH-1Ss.
- Bell Helicopter sets a new one-month delivery record of 90 commercial helicopters.

1977

- The Bell 222 makes its initial public flight at Helicopter Association of America's annual meeting. Later versions include the Bell 222A, 222B, 222SP and 222U.
- Bell Helicopter announces the development of a Bell 206B-3 JetRanger III, a more powerful version of the world's most popular helicopter.
- The U.S. Army formally accepts the initial production model of the Bell AH-1S.
- First hover flight of the Bell XV-15 (aka Bell 301) tiltrotor research aircraft takes place at Bell Helicopter's Flight Research Center.
- Deliveries of the Bell JetRanger III to customers all over the world begin.
- The U.S. Marine Corps orders 22 additional Bell AH-1Ts.
- Petroleum Helicopters Inc. (PHI) records 1,100,000 flight hours on its Bell 47s. This is a record unequaled in commercial helicopter operations.
- Bell Helicopter announces the development of the Bell 214ST, an 18-seat, twin-engine, stretched version of the Bell 214.
- The U.S. Marine Corps formally accepts the first production Bell AH-1T.
- An option to purchase 83 additional Bell AH-1Ss is exercised by the U.S. Army.

1978

- Construction begins on the two-story, 135,000 square-foot Bell Helicopter Technical Center at the Hurst, TX, facility.
- A single pilot instrument flight rules (IFR) system, designed for the new seven-seat Bell 206L2 LongRanger II, is announced. Bell Helicopter and Collins Avionics developed the system.
- The Bell XV-15 tiltrotor research aircraft is shipped to NASA Ames Research Center, Moffett Field, CA, for extensive wind tunnel testing.
- Additional Bell AH-1Ts are ordered by the U.S. Marine Corps.
- The Bell 206L2 LongRanger II receives FAA certification. First customer deliveries follow one month later.
- Bell Helicopter President James Atkins announces development of the Bell 412, an advanced technology, four-blade variant of the Bell 212.
- Sixty-six additional production Bell AH-1Ss are ordered by the U.S. Army.
- The Bell 206L2 LongRanger II receives FAA certification for single pilot IFR.

1979

- Bell receives an order for eight commercial Bell 212s from the People's Republic of China, a first by a U.S. helicopter manufacturer.
- The second Bell XV-15 makes its first flight in helicopter mode.
- First flight of the Bell 214ST occurs.
- The second Bell XV-15 completes its first conversion from hover to conventional airplane mode and back again.
- The Bell 412, destined to become Bell Helicopter Textron's first four-blade production helicopter, makes its first flight.
- Construction begins on a 270,000 square-foot, $10 million manufacturing building at the Hurst, TX, facility.
- During ImaginEighties, a Bell Helicopter Textron sponsored program, orders are received for more than 200 commercial aircraft, valued at $200 million. Included are $150 million in customer commitments for the Bell 214ST.
- Bell Helicopter Textron achieves record-setting delivery of 585 commercial helicopters to domestic and foreign customers.

So, who was this Jim Bidzos, anyway?

Jim Bidzos says he was born in 1955 in a small mountainous Greek village near the Albanian border. The Italians invaded the village during World War II; then the Germans invaded. During the Greek civil war, the village was alternatively a home to rebels and to the Greek militia. "It wasn't a good place to raise a family," recalls Bidzos, "There was nothing there but farmers and soldiers." So Bidzos' father moved to the United States to find a new life. Starting without any money or knowledge of English, Bidzos Senior worked for a year and a half, sending what little earnings he had to Greece. Finally there was enough money for his wife and son to join him. **The family settled in Ohio**—"A good place to come from," says Bidzos.

Bidzos speaks numerous languages: English, Greek, Macedonian, German, and quite a bit of Japanese. He has a green card but has no intention of becoming a U.S. citizen. "I can see three benefits to becoming naturalized," he says. "One is that I could vote. The second is that I could leave the country for more than a year without jeopardizing my resident status. And the third reason," he says with a smile, "is that it is harder to get thrown out if you are a U.S. citizen. . . . But the down side is that Greece doesn't allow you to have dual citizenship. If I became a naturalized American citizen, I would have to give up my Greek passport and all the privileges of citizenship." For Bidzos, losing Greek citizenship would mean losing his membership in the European Community, which allows him to work and travel freely within Europe. "Why should I give that up? There's no difference with a green card: you pay taxes, you can be drafted, you can be jailed." And Bidzos is dedicated to his guest country—so much so that he enlisted in the U.S. Marine Corps.

In January 1986, RSA Data Security was on the verge of failing. "The company had no products, no customers, no revenue. It had taken some money from investors, and it had all disappeared," says Bidzos. Fewer than five people worked for the company. One of them, Bart O'Brien, was an old friend that Bidzos had worked with at **Paradyne** in Florida. Both were marketing executives. In 1983, they split up, with Bidzos going off to create an international technology marketing company, and O'Brien going out to California and eventually joining RSA Data Security. O'Brien called Bidzos and said that RSADSI needed help. O'Brien described the RSA technology and the patent. Bidzos started working there on February 1, 1986.

What saved RSADSI was a little company in eastern Massachusetts, Iris Associates, that was writing a program called Notes for the Lotus Development Corporation. "They didn't know that RSA was patented," says Bidzos. "They had played around with it and had finally gotten it to work, but [their implementation] was too slow. So they were actually delighted to know that there was a company called 'RSA.' They said, 'Gosh, maybe you can help us.'"

Bidzos committed to build an RSA encryption toolkit that Iris could drop into Notes. The toolkit was written mostly by Rivest and other members of the MIT faculty. Rivest also started work on MailSafe: a program that would serve two important purposes. It would supply RSADSI with a small revenue stream, and it would demonstrate the power of public key encryption. "It was perfect for showing people that it could work, how it worked, and that it could run fast enough on a personal computer," says Bidzos.

By the time that Bidzos met with Merritt and Zimmermann in Denver, things had already turned around for RSADSI. The deal with Lotus was closed in June 1986, giving RSADSI a large amount of prepaid royalties. The next big deal, with Motorola, used RSA for commercial secure telephones. The third deal, with Digital Equipment Corporation, involved the development of a secure network system. (The project was later killed because Digital couldn't export its secure software.) Next was Novell, which built RSA encryption into NetWare.

By 1991, says Bidzos, RSADSI was making substantially more money on toolkit royalties than it was on the sales of enduser programs. Bidzos boasts that even if RSADSI never licensed another company, RSADSI could have stayed in business indefinitely at its current strength. Of course, that didn't happen. New licenses continued to pour in. By 1993, more than 100 companies were incorporating RSADSI's toolkit into their products. By this time, Bidzos had also learned that a large, secret, and incredibly powerful government agency wanted him out of business.

Working with Big Jim

Bidzos is a strong man and a strong negotiator, and he drives a hard bargain. It's a style that might not work in some businesses. But RSA Data Security had a monopoly on public key cryptography: the MIT patent on RSA. Anyone in the United States who wants to use the RSA algorithm has to either make a deal

with Bidzos or change their plans.*

Bidzos has a simple negotiating technique; no matter how well-informed the customer might be, Bidzos doesn't give a price until after he spends at least an hour educating his potential business partner about cryptography, public key, what a business can do with it, and various royalty models that RSA Data Security has for license fees. Finally he names a price. It's his goal, he says, for both RSADSI and the company that licenses the technology to make money with cryptography.

"Everyone wanted it more or less for free," says Bidzos. "I believed it had more value, and I could be persuasive." Indeed, the fact that customers made deals with RSA to license the algorithms or software is a strong testimony to the truth of Bidzos' words.

"I put our customers into one of three categories," says Bidzos. "There are those like Lotus Notes users, who I think benefit immensely from the security that is there, and generally are aware of it. The second category really doesn't understand at all that it is there, and I think really doesn't need to, like Novell. And it is still for the benefit of the users. And then there is the case where [the users] don't know it, and our direct customer doesn't want their customers to know, or at least they don't want to broadcast the fact." An example of the third category, says Bidzos, is Atari, which uses RSA as the basis of its protection scheme on video game cartridges. Only cartridges that have been signed by the company's public key work in the company's video game machines.

* In 1987, representatives from Stanford University began to claim that RSA's patent rights could not be exercised without infringing on the Merkle-Hellman patent owned by Stanford. Eventually, MIT licensed the patent rights from Stanford. MIT, in turn, passed the rights to RSADSI. In exchange for the rights, MIT pays a portion of RSADSI's patent royalties to Stanford.

Bidzos says that many people who don't contact him grossly overestimate the price of an RSA license. Newspaper accounts confirm this statement. According to an article by John Markoff in the New York Times, RSADSI's income is between $5 and $10 million a year on the sale of products, while between 2 and 4 million end-user software packages in the world include one of the company's algorithms. Court documents in a recent lawsuit imply that RSADSI's licenses might cost as little as a dollar per user for high-volume applications. Generally, Bidzos refuses to do deals in which RSA is sold to the end user as an option: he wants it embedded as part of the application program. "Users want absolute security, zero overhead, and no cost," says Bidzos. "We usually find a way to do that."

But patents aren't forever. RSADSI has been doing well, but an outside observer might wonder if RSADSI's reliance on its patents means that the company may face hard times. After all, patents last only 17 years; the RSA patent expires in the year 2000.

The reason that Bidzos isn't worried is that he isn't basing his company's future on the patents. In fact, RSA Data Security doesn't even license the patents anymore.

On April 6, 1990, RSADSI and Cylink (holder of the Diffie-Hellman and Hellman-Merkle patents) formed a partnership called Public Key Partners, whose sole purpose is to acquire the rights to cryptography patents, write licenses, and collect license fees.

RSADSI has turned its attention to the development of cryptographic toolkits. The company's BSAFE 2.1 product, introduced in the summer of 1994, included implementations of many cryptographic algorithms: Bloom/Shamir Secret Sharing, RC2 Symmetric Block Cipher, RC4 Symmetric Stream Cipher, Pseudorandom Number Generators, RSA, DES, DESX, Triple-DES, MD5-With-XOR,-RC4-With-MAC, Diffie-Hellman, and support for Privacy Enhanced Mail (PEM) by RFC 1422. The kit is designed for developers, costs $290 ($750 for a five-user license, $950 for a ten-user license), and includes a license for all of the relevant patents.

Run-time fees are separately negotiated. (As mentioned, license fees for large customers might be as low as one dollar per user.)

"We have no unhappy customers," boasts Bidzos. "If they are unhappy, we give them their money back." So far, he says, he's never had to cancel a license agreement and refund a customer's money.

A Pretty Good Program

Although Zimmermann kept in touch with Bidzos on and off during the years following their meeting in Boulder, most of his time was spent devising his own solution to the problem of public key encryption on microcomputers. First Zimmermann wrote a paper describing standards and data structures for representing encryption keys, encrypted text, and signatures. The paper was eventually published in IEEE Computer. The paper gave Zimmermann the legitimacy in the eyes of the cryptography community to be able to call other cryptographers and not be instantly dismissed as a crank. Zimmermann next turned his attention to writing a working program that implemented the RSA public key system. He called his program PGP—short for Pretty Good Privacy. (Why? Zimmermann was a fan of Garrison Keillor's "Prairie Home Companion" radio program, in which one of the "sponsors" was "Ralph's Pretty Good Groceries.")

According to Bidzos, sometime during 1990, Phil Zimmermann called RSADSI asking for "a free license" to the RSA algorithm. "When I told him 'no,' he was really upset. He told me that he was behind on his mortgage payments and that he had invested years in writing this piece of software and needed to make money from it."

"I told him that what he should do is go find some larger company," recalls Bidzos. "He said that he was trying to help us by recommending RSA to companies. I said, 'Great! If you are working with them, they'll buy a license! It will be perfectly fine that you made something for them, and they buy the license. We won't try to keep you from making money. We don't begrudge anybody a living. We just can't give you a free license to go make money with.'"

Zimmermann went back to his keyboard. By the spring of 1991, the basic structure of PGP was beginning to take shape. Zimmermann's main interest was in distributing the program as "shareware." (People could freely copy the shareware program, but some critical component of it would not operate correctly unless the user sent the author a check to "register" his copy.) Shareware programs had taken off during the late 1980s; some people had become millionaires using the concept.

Zimmermann's first attempt at shareware was a terminal program called PGT—Pretty Good Terminal. It was not very successful. But there was one hitch with either scheme: Zimmermann's PGP program violated the RSA patent held by RSA Data Security and later by Public Key Partners.

In April 1991, Zimmermann sent Jim Bidzos a one-page letter. "Dear Jim," the letter started, "Well, I'm finally getting around to writing you about requesting a royaltyfree

license for your RSA algorithm. We talked about this a few times since your 1986 visit to Boulder, when I developed my own RSA math library in C. Both you and Ron [Rivest] said then and later that you would grant me a free license to make and sell products with your algorithm. I appreciate that a lot. When we

last spoke, you said you would need a letter telling you what products it's for. It was unclear whether this meant highly detailed firm product plans or just general fuzzy plans."

Zimmermann's letter goes on to describe two projects. The first project is a low-cost secure telephone, based on encryption and voice compression. The second project is a program to do RSA/DES encryption on a personal computer. "This would be somewhat analogous to your MailSafe or ComSafe products. I guess it would sort of compete with these products. I suspect these products are not the backbone of your company's cash flow, anyway. I just think they would be fun for me to do. I probably would not be developing that jointly with another company, but I may sell it through another company's marketing channels."

Bidzos was shocked by Zimmermann's letter: despite what Zimmermann thought, Bidzos maintains that he had never promised Zimmermann a "free license" of any kind.

"I said, 'We don't give those. It is not consistent with our business, and not consistent with licenses already granted,'" Bidzos recalls telling Zimmermann. "I promised to talk to our attorneys to explore the possibility, and did. I then wrote him a letter saying 'Nope, can't do it.' He later lied, claiming in some vague statement that I promised him a license."

Without the license, a shareware version of public key encryption wasn't possible. Zimmermann wasn't sure what to do. Then something happened that would change cryptography in the United States forever: the U.S. Senate discovered data encryption.

D. James Bidzos

Made Money In**Information Technology**

Wealth **$275 Million (TNHE)**

Described as a “father of cybersecurity,” D. James Bidzos, 62, is Founder, Chairman of the Board, President, and CEO, of Verisign, Inc., which provides domain name registry services and Internet security worldwide, Bidzos’ companyoffers a range of security services, including managed DNS, Distributed Denial of Service (DDoS) mitigation and cyber-threat reporting. Bidzos served as [Verisign's] first CEO from 1995 to 2001. In **2010 the company’s authentication services were purchased by Symantec for $1.28 billion**. Bidzos returned to the CEO job in 2011. The following year, he was named Fortune’s 2012 Businessperson of the year for reviving Verisign’s income, growth, and stock performance, which previously had flagged. His compensation increased by 46 percent in 2013 to $8.5 million, including his bonus and stock awards.

Born in Greece, Bidzos he came to the United States as a boy. His father worked as a barber, and his mother managed a restaurant. A former computer programmer, he is credited with foreseeing the need for online security in the early 1990s. Bidzos is an Internet and security industry pioneer, whose accomplishments include building RSA Security, an Internet identity and access management solution provider, into the early standard-bearer for authentication and encryption, and launching Verisign as a spin-off in 1995 to develop the digital certificate infrastructure for Internet commerce. Verisign operates infrastructure services that enable and protect billions of interactions every day across the world’s voice, video and data networks.

The Mountainview, CA-based Verisign (now moved to Reston, VA) offered a variety of Internet and communications-related services in its global affiliate network. Verisign managed two of the world’s 13 Internet root servers, a.root-servers.net and j.root-servers.net, considered national IT assets by the federal government. Since 2007, the company has been focusing on its core business and whittling away less profitable side efforts. In 2009 it sold its security service business to SecureWorks and its security consulting business to AT&T. Verisign focuses now on its Internet infrastructure services. Among the company’s services are providing .com, .net, .cc, .tv, .name and .jobs domain names for websites. Bidzos served as president and CEO of RSA Security from 1988 to February 1999, and then served as RSA’s vice chairman from 1999 to May 2002.

He has been named one of Time magazine’s “Digital 50,” and is in CRN’s “Computer Industry Hall of Fame.” In September 2013, the Federal Aviation Administration named Bidzos, who is a certified pilot, to the FAA Airmen Certification Database.

Bidzos told an audience in Naples, FL in April that “apathy and ignorance are the biggest threats to your bank account today.It’s a jungle out there. We’ve got to live with the odds, and odds are, you’re going to get hacked,” the Naples Daily News reported. He is a realist, but has an extensive plan for addressing that reality.

Jump to navigation Jump to search

Paul Alec Bilzerian (Armenian: Փօլ Պիլզերեան, born 1950) is an Armenian-American businessman and corporate takeover specialist. Convicted of failing to make complete and timely disclosures on Schedule 13(d) filings related to unsuccessful takeover attempts of Cluett, Peabody and Company and Hammermill Paper Company in the 1980s, Bilzerian served a 13-month prison sentence and was also ordered to disgorge his profits, leading him to bankruptcy and a 30-year legal battle with the Securities and Exchange Commission. Bilzerian has spent the past 31 years maintaining that he is factually and legally innocent. In 2019, he renounced his American citizenship in protest of what he claims has been "a long and disappointing experience in the federal judicial system that has been consistently unjust and shown little regard for the law or the truth.".

Career

One of Bilzerian's first business deals was an investment in the 1970s in a Tampa Bay-area radio station, WPLP, which he made with two Army colleagues from the Vietnam War who had experience in the broadcasting industry. However, in a dispute over control, Bilzerian left in the late 1970s to join his father-in-law in the real estate business. After Bilzerian left the station its performance deteriorated which led to its bankruptcy and a lawsuit by Bilzerian against his former partners. Bilzerian's real estate investments were highly successful and led to the beginning of his fortune. In 1984, he moved to Sacramento, California where his father-in-law and another business associate lived.[*clarification needed*]

Failed corporate takeovers

While living in Sacramento, in 1985 Bilzerian embarked on his first two high-profile takeover attempts, one of New York clothing manufacturer Cluett Peabody & Company, and the other of Pittsburgh construction company H. H. Robertson. After Bilzerian purchased a large stake and raised his bid for the remaining 76% of Cluett Peabody in October,[7] Cluett Peabody's board of directors adopted poison pill provisions, earning them public criticism from Bilzerian. Cluett Peabody eventually accepted a competing merger offer by WestPoint Pepperell (now WestPoint Home) for $41 per share (in cash or equivalent value of WestPoint Pepperell common stock); Bilzerian and his fellow investors agreed separately to sell their stake to WestPoint Pepperell for $40 per share plus reimbursement of $7.5 million in expenses.

Bilzerian moved back to Florida in 1986. That July he and fellow investors William and Earle I. Mack (sons of New Jersey real estate developer H. Bert Mack)[10] launched a takeover bid against the Hammermill Paper Company, purchasing about 3.3 million Hammermill shares at an average price of roughly $47 per share, and then offering $900 million ($52 per share) to purchase the remainder of the company. Bilzerian's offer was ultimately rejected when Hammermill sold out to International Paper instead at $64.50 per share, but Bilzerian and his fellow investors still made a profit of more than $60 million from the deal.

Singer Corporation

In 1987, Bilzerian began what would ultimately be a successful takeover of the Singer Corporation, a defense electronics manufacturer. In October 1987, it came to light through SEC-mandated disclosures that a group of investors led by Bilzerian had purchased 2.1 million Singer shares in the preceding two months. Singer seemed an unlikely target for a takeover: early reports cast doubt on the idea that the government would permit a hostile takeover of a defense contractor, and the company had already moved its headquarters from Connecticut to takeover-hostile New Jersey in an attempt to fend off a previous takeover by T. Boone Pickens. In January 1988, Pickens provided $150 million in additional financing which helped Bilzerian acquire Singer.

Bilzerian's unexpected success was attributable to several factors. Singer chairman Joseph B. Flavin had died in early October, leaving the company without strong leadership to fight off the takeover attempt. The Black Monday crash less than two weeks later spooked competing investors. Finally, the Omnibus Budget Reconciliation Act of 1987 included provisions to disallow sales of assets in certain acquired businesses to be treated as capital gains for tax

purposes, making future takeover bids less attractive; however, takeover bids like Bilzerian's which were already outstanding on the date of the Act's passage were exempted from this tax increase.

Stock parking case

In 1986, the government stumbled onto an insider trading scheme whereby a Drexel Burnham investment banker named Dennis Levine was exchanging inside information for suitcases of cash from Ivan Boesky. This led to an indictment of Boyd Jefferies, the well known owner and Chairman of Jefferies & Company. Jefferies cut a deal to testify against three individuals in the corporate and investment banking community, including Bilzerian. The SEC then went after Bilzerian - focusing its investigation on whether he had failed to timely make two Schedule 13(d) filings and whether he was required to disclose investors in his partnerships. In May 1988, the SEC began a probe against Edward J. DeBartolo, Sr. to determine whether DeBartolo had illegally aided Bilzerian's hostile takeover attempts through "stock parking", in which one party purchases shares in coordination with another in order to keep legal ownership separated and avoid either party's holdings exceeding disclosure thresholds. Then, in December 1988 Rudy Giuliani announced that Bilzerian had been indicted in Manhattan by a federal grand jury for Schedule 13(d) disclosure violations with respect to Cluett Peabody and Hammermill Paper Company and general claims regarding failed takeovers of H. H. Robinson and Armco. Bilzerian was the first person ever to be indicted for 13d disclosure violations as the hundreds of previous cases were civil and resolved with consent decrees and without fines or penalties.

In January 1989, Bilzerian pleaded not guilty to the charges amidst growing public controversy and demanded a speedy trial to clear his name. There were, broadly speaking, two different camps of opinion on Bilzerian's actions. Much of the public had a negative view of corporate takeovers in general and saw Bilzerian's activities as "greenmail", profiting by deceiving companies into believing they faced a hostile takeover attempt and scaring them into buying their stock from him at a high price. In Bilzerian's case he never sought greenmail and always offered all other shareholders all cash for their shares at prices substantially above the market. Many saw Bilzerian as guilty of nothing but making a profit in genuine-but-failed takeover attempts which benefited all investors. In an article in *New York* magazine, Christopher Byron questioned the entire basis of the case against Bilzerian, describing it as fueled by "Puritan envy". He further stated that the Department of Justice's primary motivation for the case was not the prosecution of wrongdoing but rather the need to justify its earlier unpopular plea bargain with Boyd Jeffries of Jefferies & Company, which would see Jefferies avoid any jail time at all in exchange for the opportunity to "drag some headline-sized names through the mud". Daniel Fischel, Dean of the University of Chicago Law School, wrote Payback a treatise on the takeover era in the 1980s in which he argued Bilzerian was an innocent victim of an overzealous prosecutor, Rudy Gulliani, and never should have been indicted as he was viewed as a hero to the shareholders of Cluett Peabody and Hammermill Paper Company.

After two days of deliberations in June, the jury found Bilzerian guilty on nine counts including conspiracy, making false statements, and securities law violations. In September, Judge Robert Joseph Ward sentenced Bilzerian to four years in prison and a fine of $1.5 million because he "now must pay the price" for testifying in his own defense. Judge Ward had told Bilzerian before trial that if he lost and did not testify he would receive no jail time, but if he lost and testified he would pay the price. Bilzerian was permitted to remain free pending appeal. Bilzerian's appeal came before the Court of Appeals for the Second Circuit, which in January 1991 ruled against him in a split decision, finding no merit in his argument that his trial had been unfair. He started to serve his sentence in December 1991 at the now-closed Federal Prison Camp, Eglin at Eglin Air Force Base, Florida. Bilzerian was released from prison in December 1992 to serve out his sentence under house arrest. Bilzerian has maintained that the Court of Appeals for the Second Circuit should have reversed and vacated his conviction based on two subsequent unanimous United States Supreme Court decisions that mandated his conviction be reversed. Instead, the Court of Appeals simply ignored the Supreme Court decisions and let his conviction stand. After Bilzerian's release from prison, he became president of Utah-based software company Cimetrix. In 2002, the government confiscated Bilzerian's ownership in Cimetrix and drove the company from several years of high sales growth and profitability to the verge of bankruptcy. Bilzerian has always maintained that the government lawyers are seldom concerned about the shareholders but rather in making a name for themselves by prosecuting high profile and often innocent businessmen.

Civil suit and bankruptcy

After Bilzerian was convicted, the SEC filed a civil suit against Bilzerian based on identical charges in order to force him to disgorge the profits from the takeover attempts. Bilzerian claimed that this was double jeopardy as he had already been punished once for exactly the same conduct. In 1993, a federal judge ruled in favor of the SEC and ordered Bilzerian to disgorge $33.1 million of profits, plus interest. The total amount to be disgorged was thus $62 million. In January 1994, Bilzerian also filed an appeal against the civil judgment in the Court of Appeals for the District of Columbia. However, the court rejected his civil appeal as well.

Due to the size of the disgorgement judgment against him, Bilzerian first filed for bankruptcy in 1991. Bilzerian emerged from that bankruptcy having disgorged all his non-exempt assets in settlement of debts that mostly consisted of claims by the government. In 1999 he tried to put his house up for sale in the prestigious Avila neighborhood of Tampa, Florida, and at one point even Mike Tyson was reportedly interested in buying. After the SEC continued its pursuit of Bilzerian and the judge issued an order appointing a receiver over his assets and then issued another order that he be arrested for civil contempt, Bilzerian filed for bankruptcy again in January 2001, declaring his non-exempt assets of $15,805 against $140 million in debts, most of which was for the government's disgorgement judgment. Under Florida Bankruptcy Law, the value of his primary residence was protected from creditors. The SEC alleged that Bilzerian was using bankruptcy as a tactic to block creditors from finding out the true value of his assets, and Bilzerian argued that was a total fabrication as the bankruptcy laws require full disclosure and a trustee to take possession of his assets. Bilzerian argued the real reason the SEC opposed his bankruptcy was so that the SEC Receiver could control all his assets through an extremely cooperative federal judge in Washington who allowed the SEC to go after Bilzerian's wife and children in complete disregard for an earlier bankruptcy court judgment.

On June 11, 2001, while Bilzerian was in prison, FBI agents raided his family's residence on the strength of a sealed warrant and seized computers, files, and a Beretta firearm. The raid appeared to be related to SEC contentions that Bilzerian had concealed his ownership of assets during bankruptcy proceedings by transferring them to trusts and shell corporations, which Bilzerian claimed was a total fabrication. Bilzerian unsuccessfully sued the FBI agent for filing a sworn affidavit that contained mostly false statements but a federal judge dismissed the case. Bilzerian was released from prison in January 2002 pursuant to an agreement under which his wife, Terri Steffen would sell the residence and split the proceeds with the SEC, and transfer most of her wealth to the SEC. Bilzerian was critical of the deal, describing it as the SEC using him "as a hostage to extort money" from his wife. In May 2004, Steffen sold her residence for $2.55 million to a partnership controlled by a Belgian businessman; SEC attorneys approved the unusually low price. According to court documents filed in 2006, Steffen's parents purchased a 99% interest in that partnership three weeks later.

Education and family

Bilzerian was born in Miami, Florida, but grew up in Worcester, Massachusetts. He is an Armenian American. His father, a civil servant, and his mother later divorced, leading to troubled teenage years for Bilzerian; he would later describe himself as a "juvenile delinquent". Called into the principal's office of his high school one day in 1968 for violating the dress code by wearing blue jeans, Bilzerian impulsively responded by dropping out of school. However, after serving in the Vietnam War and earning a Vietnamese Gallantry Cross, Bronze Star Medal, and Army Commendation Medal, he went to college and earned a Bachelor of Arts with Honors in Political Science and graduated With Distinction from Stanford University in 1975. Bilzerian entered Harvard Business School that same year. He was unsure about his choice to attend, having passed on offers of admissions to several law schools in order to enroll at HBS. After his graduation, Bilzerian married Stanford classmate Terri Steffen in 1978, and moved with her to St. Petersburg, Florida.

Bilzerian has two sons, Adam and Dan Bilzerian. Adam attended Gaither High School, where he represented his school in tennis. Angered by the government's treatment of his father, Adam abandoned his dream of becoming an Army Green Beret. After graduating from Vanderbilt University, he moved to Saint Kitts and Nevis in 2007 and became a citizen there, relinquishing his U.S. citizenship in the process. Both Adam and Dan went on to careers as professional poker players; Norman Chad nicknamed them the "Flying Bilzerian Brothers" for their performance in the 2009 World Series of Poker. Adam also wrote a book about his experiences, which the Midwest Book Review's *Small Press Bookwatch* reviewed favorably as "a well-versed list of grievances with the powers that be in America, making for an intriguing read through and through". Dan has gone on to become an international celebrity with 50 million followers on social media, and is the Chairman of Ignite International, a public company traded on the Canadian Stock Exchange.

In June 2014, a Bloomberg News report incorrectly stated that Paul Bilzerian had become one of the licensed service providers who processed applications for the same Saint Kitts and Nevis citizenship-by-investment program which his son had used. The report also stated that Bilzerian had gone on to process a citizenship-by-investment application for Bitcoin investor Roger Ver, and that the two men had co-launched a website through which customers could use Bitcoins to pay for the fees and the real estate purchase in the citizenship-by-investment program. The government of Saint Kitts and Nevis responded in a statement the following week that Bitcoin was not an acceptable payment method for participation in the program.

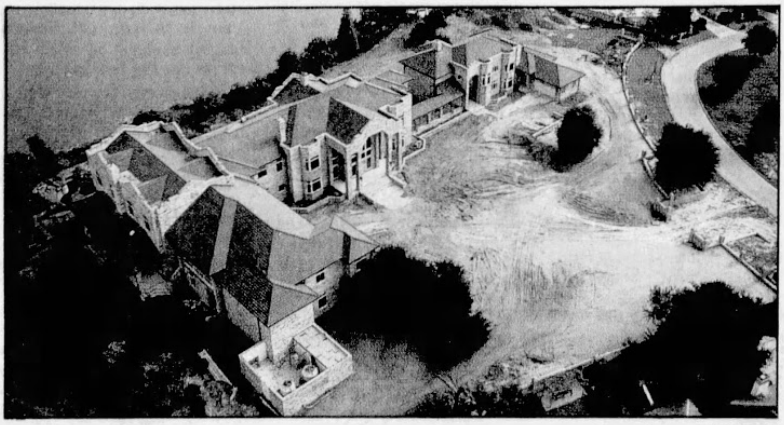
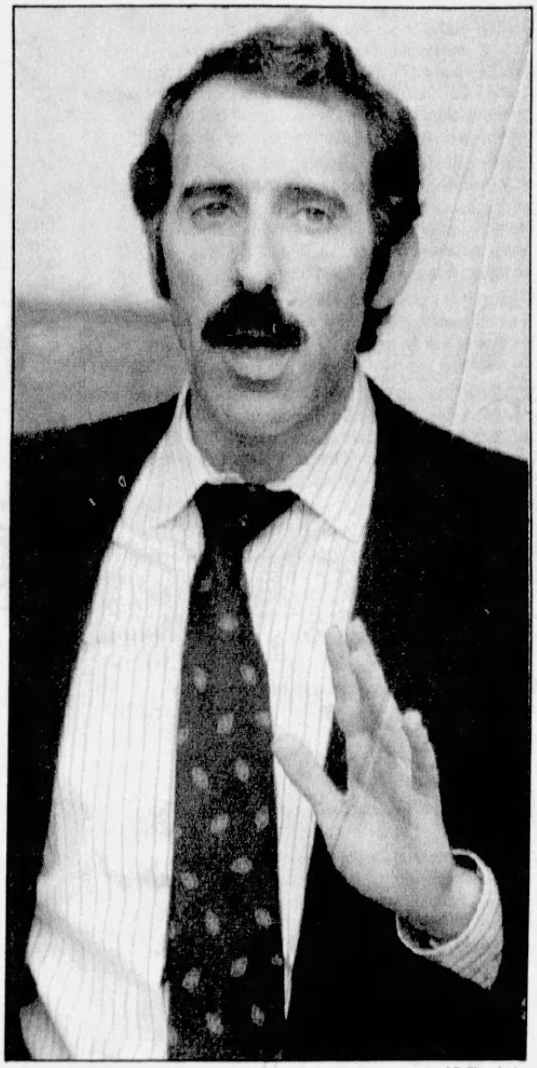
A resigned Bilzerian prepares for prison



Times photo — MIKE PEASE

Corporate raider and one-time multimillionaire Paul Bilzerian was building a multi-million-dollar home in Tampa. It is not finished.



AP file photo

Bilzerian went from being a poor man to a rich man. And now he's going to prison for breaking the rules.

The RISE & FALL of Paul Bilzerian

From 29 cents to $50-million ... and back again

- **1968:** Bilzerian had 29 cents to his name, according to a letter he wrote to a friend.
- **1983:** After receiving his MBA from Harvard Business School, putting together real estate deals and inching into the stock market, Bilzerian had a net worth of about $2-million, he said at his 1989 trial.
- **1986:** After more stock deals, his wealth was about $10-million.
- **1988:** Stock manipulations through the late '80s and the eventual takeover of the Singer Co. upped his fortune to more than $50-million by his own testimony, and as much as $81-million by some estimates.
- **1989:** Bilzerian was convicted on charges of securities fraud and tax violations. He received a sentence of four years in prison and was fined $1.5-million.
- **1991:** In August he filed for Chapter 11 bankruptcy protection, listing meager assets. Creditors and the Securities and Exchange Commission have accused Bilzerian of hiding his assets overseas. He has denied the allegations.

Times art

■ He started with nothing and made a fortune. He also broke the law and made a name for himself as a corporate raider. Soon, he'll be in prison.

By JOHN CRADDOCK
Times Staff Writer

His wife works at the secretary's desk. His mom answers the phone. And he sits sprawled in an office filled with stacks and stacks of legal documents.

On top of the stacks are pictures of two boys; in one they're wearing ski gear, in the other they're posing in phony Old West getups.

Paul Bilzerian hasn't figured out when to tell his boys, ages 8 and 10, that he is going to jail.

But on or before Dec. 2, Bilzerian, once a multimillionaire corporate raider and now a convicted felon, must turn himself in to federal authorities. He probably will serve his time at the minimum security Eglin Federal Prison Camp in Fort Walton Beach.

In an interview with the *St. Petersburg Times* on Friday, Bilzerian seemed to be steeling himself for his four-year sentence.

"I'll be better for this," he said.

Bilzerian, 41, who lives in Tampa, reflected on his life as a businessman and on the days he was mentioned in the same breath with Ivan Boesky and Michael Milken.

In fact, he still is.

Boesky and Milken also were convicted of crimes after scaling the heights of finance.

Bilzerian is philosophical about his conviction but embittered by what he believes is a miscarriage of justice.

A movie fan, Bilzerian often mentions how the kids of his generation were taught that "the good guys win."

He believes he is a good guy. Of course, a jury disagreed, as do a string of opponents who have felt his wrath.

And he knows he must face reality. He mentions a movie called *Lost in America*, in which a man asks if he can have his money back after losing at a Las Vegas casino. The manager replies that casinos give money to people who win. You lost, said the manager.

"I lost," said Bilzerian.

A tough competitor

Bilzerian also did his share of winning against tough odds.

He grew up in a working class family in Worcester, Mass. His parents divorced while he was in high school. He worked at a

The RISE & FALL of Paul Bilzerian

Bilzerian from 1A

hamburger joint to make ends meet.

Bilzerian dropped out of high school when he was sent to the principal's office for wearing blue jeans.

"I went home to change my pants, and I never came back," he testified in a court hearing two years ago.

He turned to the Army.

It was seven days before Christmas 1968 when Bilzerian arrived at Fort Jackson, S.C., wearied quietly as he took stakes in vulnerable companies.

From nothing, he became a force to be reckoned with. He brought in wealthy partners, such as William Mack, the former Tampa baseball leader, and shopping center developer Edward DeBartolo Sr.

Bilzerian hit his peak in 1988 with the $1.06-billion acquisition of the Singer Co., a proud old name in the sewing machine business that had evolved into a defense contractor. Bilzerian found the financing, bought out the shareholders and started selling off parts of

the St. Petersburg Northeast Little League.

Bilzerian sued Little League vice president Rick Brannelly for slander in May 1988 after Brannelly told the *St. Petersburg Times* that Bilzerian had "welched" on a promise to donate $5,000 to the league.

At one time, Bilzerian's sons had played in the league. Bilzerian had told league officials that if team members raised $5,000 by selling household goods door-to-door, he would match it. The team members, consisting of 5- 6- and 7-year-olds, fell short by

Times files

Paul Bilzerian poses in Tampa in 1986, during the height of his takeover activity. He failed in several attempted acquisitions that year, but made millions each time.

AP

Paul Bilzerian and his wife, Terri Steffen, leave Federal Court in New York on May3, 1989 during his trial for violating securities and tax laws, conspiracy and making false statements to the government.

- **1978:** Paul Bilzerian and two other investors move to St. Petersburg and buy a Pinellas Park radio station, converting it into WPLP/Talk Radio. Two years later, the company files for Chapter 11 bankruptcy protection.
- **1979-82:** Bilzerian works for Southern Business Enterprises Inc. in St. Petersburg, handling $25-million in real estate investments, mostly in Fort Lauderdale, Miami and Palm Beach.
- **1982:** Bilzerian pulls out of the real estate business and begins investing in stocks at the beginning of the strongest bull market in history.
- **1984:** Bilzerian moves to northern California, lining up backers for his first takeover attempt on Syntex Corp. of Palo Alto, Calif., for $1.5-billion. Deal falls through.
- **1985:** Bilzerian makes unsuccessful attempt to buy H.H. Robertson Co., a construction materials manufacturer, for $247.5-million. Several months later he loses out in a bid to buy Cluett Peabody & Co., Inc., maker of Arrow shirts. Bilzerian makes $7-million on the deal by accumulating stock and then selling it after the stock price rises as a result of the takeover attempt.
- **1986:** Bilzerian returns to St. Petersburg and targets Hammermill Paper Co., a paper producer, with a $900-million takeover bid. He loses his bid to International Paper Co., but Bilzerian and his investor group make $54-million. Shortly thereafter, Bilzerian, with the Edward J. DeBartolo Corp., attempts but fails in a takeover of Allied Stores Corp.
- **1987:** Bilzerian and a partner offer to buy Pay 'N Pak, a Pacific Coast home center store chain, for $171-million. A few months later, Pay 'N Pak rejects the bid and the partners make a profit of $8-million.
- **January 1988:** For the first time, Bilzerian is successful in a takeover as he captures Singer Co., the defense electronics contractor once famous as a maker of sewing machines, for $1.06-billion. Bilzerian sells most of the company's assets for a profit estimated at $100-million and later changes the company's name to Bicoastal.
- **December 1988:** Bilzerian indicted on 12 counts of violating securities and tax laws, conspiracy and making false statements to the government. None of the charges relates to the acquisition of Singer, but the indictment says he violated securities laws in his stock trading involving Cluett, Peabody & Co., H.H. Robertson & Co., the Hammermill Paper Co. and Armco Inc.
- **June 1989:** Bilzerian is convicted on 12 felony counts of securities fraud and tax violations. He is sentenced to four years in prison and fined is $1.5-million.
- **November 1989:** Bicoastal Corp., the successor to Singer Co., files for Chapter 11 bankruptcy protection.
- **January 1991:** A federal appeals court upholds Bilzerian's conviction.
- **August 1991:** Bilzerian files for bankruptcy protection for himself and Bicoastal Financial Corp., a Tampa-based financial services company he and his wife own. The company is separate from Bicoastal Corp.
- **October 1991**: U.S. Supreme Court upholds Bilzerian's conviction; he is scheduled to start his jail sentence.

Compiled by Times library researcher Kitty Bennett from Times files, Associated Press, Reuters

Times art

Paul Bilzerian hasn't figured out when to tell his boys, ages 8 and 10, that he is going to jail. He must turn himself in on or before Dec. 2.

ing a torn sweatshirt and no jacket. He had 29 cents and a copy of *Of Mice and Men.*

He landed on KP 16 straight days, got in two fistfights, and skipped training classes. But his physical prowess won the respect of his peers. "There was no (physical test) he couldn't max out," said a fellow recruit, Nicholas Damer.

In a letter to Damer, Bilzerian recalled that before he was shipped out to Vietnam, "I thought then that I had some greater destiny than a six-foot hole some half-way round the world.".

Damer was Bilzerian's friend for years.

A first lieutenant, he returned home with a Bronze Star.

He studied at tiny Clark University in Worcester, and at one point rode a motorcycle out West, hocked it, then hitch-hiked to California. His bushy beard and electro-shock hair were signs of the rebellious times.

In 1973 Bilzerian enrolled at Stanford University. It was a period in which he struggled financially but enjoyed "the happiest time of my life." He sometimes bunked on his friend Damer's couch. "He just sort of floated around," said Damer.

Bilzerian graduated from Stanford with honors in 1975 and received glowing letters of recommendation from his professors, which helped him gain admission to Harvard Business School.

But Harvard didn't offer the liberal surroundings he had left at Stanford.

Bilzerian criticized his money-hungry classmates for their callousness toward the little guy in society.

"I thought business couldn't care less about society," he said.

But he graduated and soon moved back to the Pacific Coast. Bilzerian and a friend in the San Francisco area joined with another man to buy a radio station almost 3,000 miles away — WPLP in Pinellas Park.

The purchase would help set a pattern for Bilzerian business deals: using other people's money, in this case $50,000 borrowed from his father-in-law. Bilzerian also helped arrange loans for the other principals.

Bilzerian converted the radio station to talk radio, but he was in a constant fight with his colleagues, according to court documents. Finally, his colleagues fired him in a dispute that wound up in court.

Bilzerian wrote his old friend Damer, by then a lawyer: "How could a struggling intelligent future millionaire be in so much damn trouble and so penniless . . . ?"

He joined his father-in-law's real estate business and worked on shopping center deals in Florida. But by the summer of 1982 he turned to the stock market on the mistaken belief that the Florida real estate market had peaked.

"I really didn't know anything about markets then, so I did what probably everybody else does and called up the local Merrill Lynch broker for recommendations," Bilzerian said.

It soon became clear that Bilzerian was no average investor. Not only was he doing his own market analysis, but by 1984 had boldly targeted the Syntex Corp., a large pharmaceuticals company, for a corporate takeover.

He needed $100-million down to finance the $1-billion acquisition, so he gathered 20 investors and laid out his plans. Before the group could launch its takeover bid, word leaked out and the stock rose in price, thus making the effort too costly.

From then on, Bilzerian operat-

the company to cover his debt.

He had finally arrived — but he didn't get to stay long.

Criminal charges; where's the money?

Only 11 months after his takeover of Singer, the government filed criminal charges against Bilzerian.

Prosecutors said Bilzerian made millions of dollars by accumulating the stock of takeover targets while concealing ownership of the stock in secret accounts. Failure to tell the Securities and Exchange Commission the true owner of a stock is a criminal violation.

Prosecutors said Bilzerian also failed to report on his income tax $4-million that he had earned in stock deals.

In the six-week trial, the government case portrayed Bilzerian as a cheat. In fact, after hearing Bilzerian's testimony, the judge in the case concluded: ". . . He lies."

Although the conviction is behind him, there are still questions to be answered about the life of a man who has left his own special mark on American business history.

For one, where's the money?

Bilzerian says he has gone the full route: From 29 cents in his pocket, to a fortune estimated at more than $50-million, back to virtually nothing. He filed for Chapter 11 bankruptcy in Tampa and is trying to liquidate in Chapter 7. He said he is personally bankrupt.

But he still has two homes in the exclusive Avila development in Tampa, though both in his wife's name. One is an unfinished mansion in which he has invested $5-million to $6-million.

Meanwhile, the Securities and Exchange Commission has filed a civil suit in hopes of recovering as much as it can from Bilzerian. Another group seeks $22-million. A St. Petersburg lawyer, Robert Bolton, wants $100,000 won in a judgment.

Creditors have charged — and Bilzerian has denied — that the bulk of his fortune is overseas in foreign accounts.

That question likely will be settled in court, as are many of Bilzerian's affairs.

For example, when he was breaking up the Singer Co., more than a dozen lawsuits were filed.

But perhaps Bilzerian's weirdest legal battle was his clash with

$52.25, by Bilzerian's estimate. The league contended the full amount had been raised. Bilzerian said that wasn't true and refused to pay.

His slander suit was dismissed.

Bilzerian now says he wishes he had paid the money, as he sometimes was advised to do, but he was just too stubborn.

One lawsuit in which exceptional bitterness lingers is the tangle between Bilzerian and Damer, a person Bilzerian described in a letter as a close friend.

When Bilzerian was in trouble in the radio station deal, Damer left San Francisco and came to Florida to represent Bilzerian. Broke, Bilzerian wrote an I.O.U., called a promissory note, for $10,000 in 1979.

Years passed and Damer kept the note.

In 1985, Bilzerian made $7.5-million on a stock deal. Damer saw an article in the newspaper reporting how Bilzerian had paid a $250,000 fee to a lawyer. Damer wrote a letter reminding his old friend about the $10,000 note. The letter ended with a line inviting Bilzerian to San Francisco.

Bilzerian, then worth close to $10-million, wrote back: "I have been hoping, for the past several years, that I would not have to address the subject of the $10,000 promissory note as it has been my belief that to do so would result in the termination of a friendship that is nearly 16 years old. Nevertheless, let us begin to write what I fear will be the final chapter."

Astonished, Damer sued and won a $75,000 judgment he likely will never collect.

Of his former friend, Damer said, "I think he went off the deep end. We were having this conversation once about greatness. I argued you could be great and not be famous. He said you had to have notoriety. He said Hitler was great, Stalin was great."

Bilzerian has won his share of notoriety, but his story continues.

After four years of prison, or perhaps less, this average-sized man of enormous physical strength, stamina and intelligence could be back on the street, sporting his trademark bushy sideburns and moustache.

But at least one thing will be different, he says. He won't re-enter the business world.

"I got into business because it was fun," he said. "It's not fun anymore."

Jacob Blaustein (born 1892)

Father was Louis Blaustein - " (January 16, 1869–1937) was an American businessman and philanthropist who founded the American Oil Company (AMOCO)."

https://en.wikipedia.org/wiki/Louis_Blaustein

Below - [HN00G0][GDrive]

Jacob Blaustein Is Dead at 78; Founder of the American Oil Co.

Special to The New York Times

BALTIMORE, Nov. 15—Jacob Blaustein, founder of the American Oil Company and a president of the American Jewish Committee, died tonight at his farm. He was 78 years old.

Influential on Many Fronts

After founding American Oil in 1910 and after seeing his enterprise turn from a small, localized company into one of the giants of the oil industry, Jacob Blaustein turned to his other interests.

He helped talk Vyacheslav Molotov, the Soviet Union's Foreign Minister, into accepting the human rights articles of the United Nations Charter when that body was still in its conceptual stages in San Francisco in 1945.

He helped to convince Premier David Ben-Gurion of Israel to accept the United Nations plan to partition Palestine in 1948.

And later he negotiated with Chancellor Konrad Adenauer of West Germany the payment of more than $10-billion in reparations to the survivors of Adolf Hitler's war crimes.

But basically, Mr. Blaustein was neither a diplomat nor a professional fund-raiser nor an adviser to five United States Presidents—he was "an oil man."

Fueled Lindbergh's Plane

Jacob Blaustein was born Sept. 30, 1892, in Baltimore, the son of Louis and Henrietta

first major court battle, with Standard Oil (N.J.), which through a variety of intricate financial maneuvers had managed to gain partial control of the fledgling company. The suits dragged on for 17 years, during which American continued to grow.

Finally, in 1954, American Oil became a totally owned subsidiary of the Standard Oil Company. Through various other family controlled enterprises, Mr. Blaustein also owned a fleet of oil tankers, oil wells in Texas and Louisiana and several manufacturing companies. He had vast real estate holdings in Baltimore, San Diego, Dallas and Los Angeles and was a controlling stockholder of the Union Trust Company of Baltimore.

In 1945, his diplomatic career began when President Franklin D. Roosevelt asked him to attend the formative meetings of the United Nations as a consultant to the United States delegation.

In 1948, when President Harry S. Truman was debating whether to seek election as President, he called in six people to advise him. Mr. Blaustein was one.

The next year, he became president of the American Jewish Committee, and it was in this capacity that he negotiated with Chancellor Adenauer and continued his talks with Jewish leaders over the Palestinian, by that time, the Israeli, question.

son of Louis and [illegible] Blaustein. His father had come to the United States from Lithuania, and after working as a peddler in eastern Pennsylvania, settled in Baltimore, where he opened a wholesale grocery store.

Louis Blaustein later went to work for a small oil jobber in Maryland, but Standard Oil (N. J.) soon wiped his employer out of business, and shortly thereafter, with his son, started a new company—American Oil.

Despite the impressive name, the new oil company consisted basically of three men, a small tank wagon and a horse, all operating out of a converted stable. The three were Louis and Jacob Blaustein and the horse driver.

Thanks to numerous innovations, the company grew quickly. It opened the first drive-in gasoline station in the United States, on Cathedral Street in Baltimore. Then, a gasoline pump complete with meter reading in dollars and gallons. And, finally, its greatest innovation — anti-knock gasoline.

They called it Amoco, still being sold at American Oil stations, and it blended benzol, a coke by-product with the gasoline. This Amoco powered Charles A. Lindbergh across the Atlantic Ocean in his Spirit of St. Louis in 1927.

Within five years, the Blausteins were embroiled in their

In 1955, President Dwight D. Eisenhower appointed him a regular member of the United States delegation to the United Nations, where he spent more time confronting the Russians "head to head."

'Stick to Your Guns

"With the Russians you have to make sure you're right and then stick to your guns no matter what," Mr. Blaustein said. "If you deal from strength, you may or may not win your point, but at least they will respect you. If you evidence weakness, you gain neither."

He had also been an adviser to Presidents Kennedy and Lyndon B. Johnson.

After his retirement as president of the American Jewish Committee in 1954, Mr. Blaustein continued as honorary president of the organization to his death. He also continued his membership on the boards of the various companies he headed and in many cases founded.

He is survived by his widow, the former Hilda Van Leer Katz; a son, Dr. Morton K. Blaustein of Baltimore; two daughters, Mrs. David Hirschhorn of Baltimore and Mrs. Arthur E. Roswell of Somerville, N. J. a sister, Mrs. Henry Rosenberg of Baltimore, and eight grandchildren.

A funeral service is scheduled at noon Wednesday at Temple Oheb Shalom in Baltimore.

David Abraham Blech (born November 25, 1955) is an American businessman, investor, and venture capitalist. He is one of the financial pioneers of the biotech industry and was once known as the "King of Biotech".

Early life and education

Blech grew up in Brooklyn, New York.[1] Blech graduated from Baruch College and earned a Master's in Music Education at the Teacher's College of Columbia University.[2]

Early career

Since 1980, Mr. Blech has been a founder of companies and venture capital investor in the biotechnology sector. His initial venture investment, Genetic Systems Corporation, which he helped found with his father and his brother Isaac Blech, was built around promising scientists, including the high profile microbiologist Robert Nowinski. It developed the first inexpensive and accurate test to diagnosis sexually-transmitted diseases using monoclonal antibodies, allowing tens of thousands of babies to be born to women who otherwise would have become sterile from pelvic inflammatory disease.[3] The company was sold to Bristol Myers in 1986 for $294 million (3%) of Bristol Myers stock.[4]

In 1989, Blech co-founded Icos Corporation with Nowinski and George B. Rathmann, receiving the largest start up financing in biotech history at $33 million. Icos discovered the drug Cialis, which was acquired by Eli Lilly in 2003 for over $2.6 billion. The Blechs also co-founded Celgene Corporation in 1986, which was a unit of the Celanese Corporation, and was spun off as an independent company following the merger of Celanese Corporation with American Hoechst Corporation. Celgene introduced two major cancer drugs, and has a current value of over $35 billion, making it the 5th largest biotech company in the world.[5]

Other companies he helped found include DNA Plant Technology, Neurogen Corporation, Incyte Pharmaceuticals, Alexion Pharmaceuticals, ARIAD Pharmaceuticals, Neurocrine Biosciences, Cytosorbents Inc, and Intellect Neurosciences. He was also instrumental in the turnaround of Liposome Technology Inc. and Biotech General Corporation. In 1990, Mr. Blech founded D. Blech & Company, which, until it ceased doing business in September 1994, was a registered broker-dealer involved in underwriting biotechnology issues.[citation needed] At his peak in 1992, Blech's wealth was estimated at almost $300 million, briefly making him a member of the Forbes 400.[6]

Falling deep into debt, D. Blech & Co was in violation of net capital rules and ceased operations on September 22, 1994, a day that came to be known as "Blech Thursday" in the biotech industry.[5]

Blech came under investigation by the SEC for securities fraud. During the investigation Lloyd Schwed, a Florida-based attorney representing a group of former brokers, attempted to blackmail Blech by promising to withhold tapes subpoenaed during the investigation. Blech became an informant in exchange for leniency. He pleaded guilty to two counts of criminal fraud and was sentenced to a five-year term of probation.[5] A documentary film titled The Blech Effect was released in 2020 documenting his rise and fall in the industry.

Personal

Blech says he is bipolar, has a gambling addiction and is a member of Gamblers Anonymous.[7][8]

- Citizenship German
- Scientific career Fields : Virologist
- Institutions
  - Reims Island, German Reich
- Influenced
  - [**Dr. Erich Traub (born 1906)**]

Kurt Blome (31 January 1894, Bielefeld, Westphalia – 10 October 1969) was a high-ranking Nazi scientist before and during World War II. He was the Deputy Reich Health Leader (Reichsgesundheitsführer) and Plenipotentiary for Cancer Research in the Reich Research Council. In his autobiography Arzt im Kampf (A Physician's Struggle), he equated medical and military power in their battle for life and death.

Blome was tried at the Doctors' Trial in 1947 on charges of practicing euthanasia and conducting experiments on humans. He only admitted that he had been ordered in 1943 to experiment with plague vaccines on concentration camp prisoners. In reality, starting in 1943 he "assumed responsibility for all research into biological warfare sponsored by the Wehrmacht" and the S.S.[1] Although he was acquitted of war crimes charges at the Nuremberg Doctors' Trial, this was mainly due to the intervention of the United States as his earlier admissions were well known. It was generally accepted that he had indeed participated in chemical and biological warfare experiments on concentration camp inmates.[2]

Director of the Nazi biological warfare program

As Plenipotentiary for Cancer Research in the Third Reich, Blome had a longstanding interest in the "military use of carcinogenic substances" and cancer-causing viruses. According to Ute Deichmann's book Biologists under Hitler, in 1942 he became director of a unit affiliated with the Central Cancer Institute at the University of Posen (Poznań in Poland, annexed by Germany in 1939). Although he claimed that the work at this institute involved only 'defensive' measures against biological weapons, Heinrich Himmler, Hermann Goering, and Erich Schumann, head of the Wehrmacht's Science Section, strongly supported the offensive use of chemical and biological weapons against Britain, the Soviet Union, and the United States. In 1943, Schumann wrote to Dr. Heinrich Kliewe, one of the Wehrmacht's biological warfare experts that "in particular, America must be attacked simultaneously with various human and animal epidemic pathogens as well as plant pests."[3] According to Kliewe, plague, typhoid, cholera and anthrax were being developed as weapons, as well as a new "synthetic medium for the spread of these bacteria" which would allow them to remain virulent for eight to twelve weeks.[4]

As part of the Nazi biological warfare program code-named Blitzableiter (Lightning Rod), Blome's institute was therefore "a camouflaged operation for the production of biological warfare agents", and its construction was overseen by Karl I. Gross, an S.S. officer and specialist in tropical diseases, who had conducted lethal experiments on 1,700 prisoners at the Mauthausen concentration camp.[5] It was surrounded by a ten-foot high wall, guarded by a special S.S. unit, and designed to prevent the accidental release of the various biological agents being produced there. By May 1944, the institute had sections devoted to physiology-biology, bacteriology and vaccines, radiology, pharmacology, cancer statistics and a tumor farm, and had received at least 2.7 million Reichsmarks in funding from the Wehrmacht and S.S. in 1943–45.[6]

Blome worked on methods of storage and dispersal of biological agents like plague, cholera, anthrax, and typhoid, and also infected prisoners with plague in order to test the efficacy of vaccines. At the University of Strassburg, a "special unit" headed by Prof. Eugen von Haagan and employing researchers like Kurt Gutzeit and Arnold Dohmen, tested typhus, hepatitis, nephritis, and other chemical and biological weapons on concentration camp inmates.[7] Gutzeit

Kurt Gutzeit and Arnold Dohmen, tested typhus, hepatitis, nephritis, and other chemical and biological weapons on concentration camp inmates.[8] Gutzeit was in charge of hepatitis research for the German Army, and he and his colleagues carried out virus experiments on mental patients, Jews, Russian POWs and Gypsies in Sachsenhausen, Auschwitz and other locations.[8] In October 1944, Himmler also ordered Blome to experiment with plague on concentration camp prisoners.[9]

Use of insect vectors in biological warfare

In 1943, Blome proposed spreading malaria "artificially by means of mosquitoes" and experimented on prisoners at Dachau and Buchenwald with lice in order to cause typhus epidemics.[10] Eduard May, director of the Entomological Division of the SS Institute for Practical Research in Military Science, received a commission to experiment on concentration camp prisoners with "humanly harmful insects" starting in October 1943, which was closely connected with Blome's biological warfare program.[11] May collaborated with him in experiments on "the artificial mass transmission of the malaria parasite to humans", with infected mosquitoes dropped from planes. In addition, the Wehrmacht's Veterinary Section, which included research projects on animal diseases being conducted by [**Dr. Erich Traub (born 1906)**] at the Insel Riems (Riems Island) Institute, was developing methods to spread these by aircraft over Britain, the U.S. and the Soviet Union.[12] Like Kurt Blome's cancer research institute in Posen, the State Research Institute at Insel Riems was a dual use facility during the Second World War where at least some biological warfare experiments were conducted. It was founded in 1909–10 to study foot-and-mouth disease and by World War II employed about 20 scientists and a staff of about 70–120. From 1919 to 1948, its director was Otto Waldmann. Hans-Christoph Nagel, a veterinarian and biological warfare expert for the German Army, was in charge of research into the use of animal and insect diseases as biological weapons. Like Blome, Traub was also employed by the U.S. government after the war as a biological warfare expert.[13]

Insecticides and experiments with nerve gas

Blome also worked on aerosol dispersants and methods of spraying nerve agents like Tabun and Sarin from aircraft, and tested the effects of these gases on prisoners at Auschwitz.[9] I.G. Farben had developed nerve gas in 1936 as a result of its research into insecticides, and Blome's duties included preparing defensive measures against possible Allied use of insect-borne biological weapons, either in a first strike or in retaliation for German use of such weapons. As early as September 1940, Wolfram Sievers, director of the S.S. Ahnenerbe Institute, had warned Blome of the need to expand the production of insecticides to deal with this eventuality.[14] This led Blome to experiment with the dispersal of insecticides, fungicides and nerve gas from aircraft, especially after Hitler had ordered a "drastic increase" in the production of Tabun and Sarin at I.G. Farben's Dyhernfurth factory in eastern Germany. On orders from Himmler in 1944, Blome also tested these on inmates at Auschwitz.[15]

Flight from the Poznan Institute

Blome fled from Posen in January 1945 just ahead of the Red Army, and was unable to have the facilities completely destroyed. He informed Walter Schreiber, head of the Wehrmacht's Military Medical Inspectorate, that he was "very concerned that the installations for human experiments that were in the institute and recognizable as such, would be very easily identified by the Russians."[16] He relocated to the town of Geraburg in Thuringia, where the Wehrmacht and SS had already constructed another biological warfare facility disguised as a cancer research institute. Blome brought his biological cultures with him from Poland, and was still promising Hitler a Wunderwaffe or 'miracle weapon' that would turn the tide of war in Germany's favor, but the Geraburg facility was captured by the U.S. Army in April 1945, along with its records and equipment.[17]

Collaboration with Unit 731 and the Japanese biological warfare program

Throughout the war, the German and Japanese biological warfare programs exchanged information, samples, and equipment by submarine. The last of these submarines departed from Japan as late as May 1945. The Japanese destroyed many of the records about these contacts and the biological warfare program prior to their own surrender in August 1945. In the 1930s, Hitler had ordered a group of officers led by Otto Muntsch to study Japan's use of chemical and biological weapons against China. These programs of scientific cooperation and exchange were formalized in a series of agreements in 1938–39. Hojo Enryo, a Japanese Army doctor and expert in biological weapons "frequently visited the Robert Koch Institute as well as companies under German occupation to collect information about research on bacteriological warfare" and gave a lecture on this subject at the Berlin Military Academy of Medicine in October 1941.[18] Gerhard Rose, who was "the German expert on tropical diseases and epidemic typhus" and later a defendant at the Nuremberg Doctors Trial, supplied samples of the yellow fever virus to Unit 731 that they had been unable to obtain from the United States.[19] Blome's own institute in Posen was very similar in design to Unit 731's facility in Pingfan, Manchuria.[20]

Postwar activities and employment by the United States

Blome was arrested in Munich on 17 May 1945 by the United States Counter Intelligence Corps (an army intelligence service). He had no papers except his driving licence. After some weeks of custody, during which the CIC checked on his identity, Blome was taken to Kransberg Castle (a medieval castle north of Frankfurt). After his arrival at the castle a secret message was transmitted to Operation Alsos, an Anglo-American team of experts, tasked with investigating the state of German and Italian weapons technology towards the end of the war:

In 1943 Blome was studying bacteriological warfare, although officially he was involved in cancer research, which was however only a camouflage. Blome additionally served as deputy health minister of the Reich. Would like you to send investigators?"[21]

It is believed that American intervention saved Blome from the gallows in exchange for information about biological warfare, nerve gas, and providing advice on to the American chemical and biological weapons programs [22] **In November 1947, two months after his Nuremberg acquittal, Blome was interviewed by four representatives from Camp Detrick, Maryland, including H.W. Batchelor, in which he "identified biological warfare experts and their location and described different methods of conducting biological warfare."**[23]

In 1951, he was hired by the U.S. Army Chemical Corps under Project 63, one of the successors to Operation Paperclip, to work on chemical warfare. His file neglected to mention Nuremberg. Denied a visa by the U.S. Consul in Frankfurt, he was employed at European Command Intelligence Center at Oberursel, West Germany.[24] He worked there on a never-declassified top secret project labeled in Blome's foreign scientist case file as "Army, 1952, Project 1975".[25]

He was not arrested or charged with war crimes again after his acquittal at the Nuremberg Doctors' Trial in 1947. He also continued to practice medicine in West Germany, and was active in politics as a member of the right-wing Germany Party. He died in Dortmund in 1969.[26]

Merson Booth (born 1924)

FindAGrave - [HL000S][GDrive]

LCDR Merson Booth

BIRTH 27 Mar 1924 / Minneapolis, Hennepin County, Minnesota, USA

DEATH 26 Oct 2012 (aged 88) / Bethesda, Montgomery County, Maryland, USA

BURIAL United States Naval Academy Cemetery / Annapolis, Anne Arundel County, Maryland, USA

Merson Booth, 88, a retired nuclear engineer with the old Atomic Energy Commission, died Oct. 26 at his home in Bethesda. He had Parkinson's disease, his son William Booth said.

Mr. Booth was a 1946 graduate of the U.S. Naval Academy in Annapolis. Early in his naval duty, he was assigned to work on the U.S. nuclear weapons program in Los Alamos, N.M.

In the early 1950s, he was recruited by Adm. Hyman S. Rickover to participate in the early development of the Navy's first nuclear-powered vessels.

While serving in the Navy, Mr. Booth attended graduate school at the Massachusetts Institute of Technology, receiving advanced degrees in naval architecture and marine engineering in 1953 and in nuclear engineering in 1955.

He resigned from the Navy as a lieutenant commander in 1958 and joined the Atomic Energy Commission. He worked in reactor development and retired in 1972 as chief of systems.

Merson Booth was born in Minneapolis. He was a member of the Naval Academy's Class of 1947 but graduated a year early as part of an accelerated wartime program. He was captain of the sailing team at the Naval Academy.

*In later years, Mr. Booth sailed a Hinckley Bermuda 40 sailboat on Chesapeake Bay and was a commodore of the Chesapeake Bay Bermuda-40 Association. He was a member of the Gibson Island Club [see **Gibson Island, Maryland**] in Anne Arundel County and River Road Unitarian Universalist Congregation in Bethesda.*

He volunteered at St. John's College in Annapolis and completed the course work for a doctorate in philosophy at Georgetown University.

Survivors include his wife of 64 years, Barbara Winter Booth of Bethesda; three children, James Booth of Davis, Calif., Kathryn Johnson and William Booth, both of Bethesda; and seven grandchildren.

NUCLEAR REACTOR IN ILLINOIS IS READY

WASHINGTON (AP)—The Dresden nuclear power reactor in Grundy County, Ill.—believed to be the largest of its type in the world—probably will be ready to go to full power early in June.

That was the forecast Friday of Murray Joslin, vice president tf Commonwealth Edison Co. of Chicago before an Atomic Energy Commission hearing. Examiner Samuel W. Jensch, in winding up two days of testimony, said he plans to rule by next Friday on the Company's request to operate at full rated power of 630 thermal megawats.

Joslin said the reactor's output —enough to supply the electrical needs of a city of 200,000—will be distributed over an 11,000 square mile area in northern Illinois.

The AEC's advisory committee on reactor safeguards, in a letter made part of the hearing record, has approved operation of the reactor at full power by means of step-by-step increases.

The reactor, situated near Morris, 47 miles southwest of Chicago, has been operating at half power in recent weeks.

Dr. Merson Booth of the AEC's Hazards Evaluation Branch of the Division of Licensing and Regulation, told Jensch that results so far give "reasonable assurance" that the reactor can be operated at full power "without undue hazard to public health and safety."

Jensch's intermediate decision will be subject to approval of the full AEC.

1960-05-12-mt-vernon-register-news-pg-1-clip-aec

able for a canal on American soil, to gather data on subsurface soil conditions and to make a preliminary estimate of the proposed waterway's cost.

President Eisenhower has asked Congress for $20,000 to begin the survey, estimated by the Engineers to have a final cost of $35,000.

AEC Inspectors Okeh Plans For Humboldt Plant

WASHINGTON — UPI — Atomic energy commission safety inspectors have concluded an atomic reactor can be built near Eureka, Calif., "without undue risk to the health and safety" of the public.

Merson Booth, chief of the hazard evaluation branch of the AEC's licensing division, made the statement at an atomic energy commission hearing on a construction permit for the reactor.

The commission is considering a proposal by the Pacific Gas and Electric Company to build a 50 megawatt electrical boiling water reactor at its Humboldt Bay power plant four miles from Eureka.

"Our examination of the proposed project and reports of the advisory committee on reactor safeguards," Booth said, "have led us to conclude that the applicant has submitted sufficient information to provide reasonable assurance that the Humboldt facility can be constructed and operated at the proposed location without undue risk to health and safety as to the public."

The San Francisco Examiner (San Francisco, California) • 20 Jun 1961, Tue • Page 13

'No Atom Peril To Pleasanton'

A three man panel of Atomic Energy Commission experts last night declared the proposed $8,000,000 superheat reactor at General Electric Company's Vallecitos Atomic Laboratory would not endanger the Pleasanton area if properly operated under AEC regulations.

The panel, consisting of Robert Lowenstein, acting director of the AEC's division of licensing and regulation, Dr. Clifford K. Beck, assistant director, and Merson Booth, reactor engineer, discussed the effects of the reactor before an informal public meeting at the Alisal Elementary School in Pleasanton.

Some 100 persons attended the meeting, including personnel from the California State Radiation Service, State and County Public Health Services, representatives from the State Public Utilities Commission, and the Water Pollution Board.

The AEC panel members said they saw no reason why GE's application to construct the experimental reactor would not be approved at a formal hearing at AEC headquarters on June 29.

Test Reactor Safeguards Adequate, Witnesses Say

PLEASANTON, June 30—An experimental nuclear reactor General Electric Company proposes to build here at its Vallecitos Atomic Laboratory would not endanger the public.

This was the testimony yesterday of witnesses who appeared at an Atomic Energy Commission hearing at Germantown, Md., on GE's application to construct the $8 million steam superheat nuclear reactor.

Officials of GE, who hope to begin erecting the reactor next month, believe that use of the experimental reactor will help eventually to make nuclear power plants more economical through the use of superheated steam.

Among those at the hearing was Col. Alexander Grendon, coordinator of atomic energy development and radiation protection for the State of California. He testified that the state had intervened as a double check to assure a safe operation, adding that there was no evidence of undue risk to the public in the proposal.

GE officials said the worst possible accident which could be foreseen would not endanger seriously a person standing on Vallecitos Road, 2,000 feet from the reactor.

It was pointed out that the road is the closest public point to the reactor and that only 16 houses were located within a two-mile radius. Pleasanton is more than three miles away.

Grendon closely questioned GE and AEC officials about radioactive gases to be released from the new reactor or existing reactors at the laboratory.

Jay L. Murray, safeguard evaluations engineer for GE, said chimneys of varying height and at least a quarter mile apart would help dilute such gases. He said devices to measure radioactivity from gases would insure that the permissible annual average would not be exceeded.

John Barnard, GE engineer in charge of the design of the new reactor, said monitors would sound an alarm if radiation exceeded normal levels.

Merson Booth, reactor engineer for the AEC, said further study of atmospheric conditions at the site should be made, declaring that the radioactivity level asked by GE was not justified by information submitted to the AEC.

Booth said his objection was based on inadequate information rather than on a conviction that it actually was unsafe. The GE design, he said, was flexible enough to adjust the discharge of gases to a safe level.

GE said the reactor, rated at 12.5 thermal megawatts, would be the world's first separate superheat reactor. Fuel will consist of about 5,300 pounds of uranium dioxide, enriched with Uranium 235. The reactor will be enclosed in a steel cylinder 48 feet in diameter and 128 feet tall.

The application was taken under advisement by AEC presiding officer Samuel W. Jensch.

1965 (Feb) - US AEC - Oak Ridge Nuclear Safety - Behavior of iodine in reactor containment systems

See report : [HG000O][GDrive]

Behavior of iodine in reactor containment systems

FOREWORD

*This is the fourth report prepared under the auspices of the Nuclear Safety Information Center, which was established in March **1963** at the Oak Ridge National Laboratory under the sponsor- ship of the U.S. Atomic Energy Commission. The Center serves as a focal point for the col- lection, storage, evaluation, and dissemination of information in the following areas:*

- *Containment of nuclear facilities*
- *Fission-product release, transport, and removal*
- *Nuclear instrumentation, control, and safety systems*
- *Radioactive effluent control monitoring, movement, and dosage **0** Reactor transients, kinetics, and stability*
- *Meteorological considerations*

In addition, the Center prepares the quarterly technical progress review Nuclear Safety and has a reference file stored on magnetic tape for the computer search of safety information and the preparation of a quarterly, indexed bibliography of the nuclear safety literature.

Inquiries concerning the services, capabilities, and operation of the Center should be addressed to:

Wm. B. Cottrell, Director

Nuclear Safety Information Center Oak Ridge National Laboratory

P. 0. Box Y

*Oak Ridge, Tennessee **37831***

The present report was prepared at the request of Merson Booth of the Analysis and Eval- uation Branch of the AEC Division of Reactor Development. The subject is of particular interest, both because of the extensive research and development in the subject area for a number of years in this country and elsewhere - particularly in the United Kingdom - as well as its potential use in reactor safety evaluations. While this active interest makes the report quite timely, it should be recognized that it is, in a sense, a progress report, because new and per- tinent information on the subject is being generated daily. Nevertheless, the authors have attempted to condense, to summarize, and to some extent, to evaluate the present state of knowledge on the behavior of fission-product iodine when it is released into a containment system as a result of a reactor accident. It has not been possible to use or even to refer to all published work on iodine behavior, because of the large mass of the available information. The authors furthermore recognize some bias toward the use of data and references originating in the research and development program at ORNL, but they have tried not to neglect the more pertinent information from other installations.

Winter, William "Bill" R. Jr.

MADISON — William R. "Bill" Winter Jr., age 65, passed away unexpectedly on Friday, September 1, 1995, at his home. He was born on April 21, 1930, to William R. and Cathryn (Mackie) Winter Sr. Bill graduated from Wauwatosa High School, and the University of Wisconsin - Madison. He served in the U.S. Army during the Korean War before returning to Madison to work as a Mechanical Engineer with the Midwestern Universities Research Association. From 1968-1984, Bill worked with the University of Wisconsin - Madison, Physical Science Laboratory, first as a Project Administrator, and later as Project Engineer on the Aladdin Project. Since 1984, Bill served as an Engineering Group Leader with the Universities' Synchrotron Radiation Center. Bill married the former Barbra Hendrickson on August 6, 1955. He is survived by his wife; a daughter and son-in-law, Laurie and Ben Hable of Ankeny, Iowa; three grandchildren, Burton, Robbie, and Allison; he is also survived by two sisters, Miriam Bateman of Mequon, and Barbara (Merson) Booth of Bethesda, Maryland; five nieces; and nephews. He was pre-

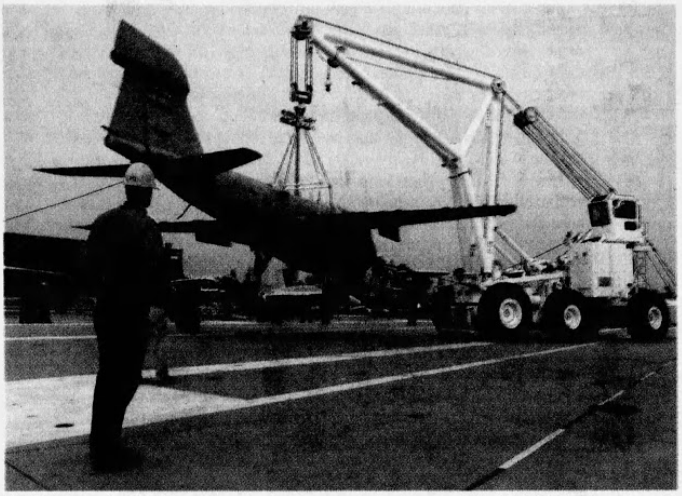
Inventory manager for the US Navy ? William C Booth

NATTC Air Department receives new airframes

By Megan Kohr
Gosport Staff Writer

Better training making the Navy efficient and safe is becoming more prevalent as the Naval Air Technical Training Center (NATTC) Air Department recently received six new airframes for crash and salvage students to train bringing their airframe count up to 11 trainers.

The NATTC Air Department's mission is to train personnel in the technical phases of aircraft handling, crash and salvage procedures and tactics, shipboard aviation firefighting, aviation fueling systems and aviation launch and recovery equipment. To adhere to the mission, the Air Department needed more realistic equipment to train on before the students are sent out to the fleet.



USS Kitty Hawk (CV 63) crash and salvage crew train with one of the NATTC Air Department's new airframes EA-6B Prowler onboard NAS Pensacola Feb. 28. Photo by Megan Kohr

"The time to train is aboard NATTC while attending Aviation Boatswain's Mate Handling (ABH) "C" School and Aviation Firefighting Shipboard Team Trainer, not in the landing area of the ship after a major crash when the airplane is on fire and the pilot is trapped and unconscious," CW03 Patrick Halinski from the NATTC Air Department, said. "Properly trained crash crew personnel, senior and junior ABH's on diesel and nuclear powered carriers and large L class ships will be able to save lives in the event of a crash or fire aboard ship."

Halinski presented his case to the Naval Aircraft Strike Board throughout 2006 and 2007 stating that the airframes were not conducive to training fleet crash and salvage crews and ABH "C" school students on aircrew rescue; aircraft emergency and normal entry procedures; aircraft emergency shutdown; and salvage procedures and tactics.

"The aircraft I had were stripped of everything that is required to conduct this kind of training or the airframe itself was so old and corroded that they did not pass inspection that would allow them to be hoisted by a crane," Halinski stated. "For example, the emergency procedure to shutting down a Hornet is to pull the throttles aft, secure the fuel flow to the engines by pushing the left and right fire warning lights, ensure the Auxiliary Power Unit switch is in the off position and place the battery switch in the off position. For years, instructors were literally pointing to holes in the cockpits where these components are supposed to be and telling the students the actions."

The board empathized with Halinski's situation and arrange for the NATTC Air Department to receive aircraft that were going to be stricken from the Navy. According to William C. Booth, inventory manager for the Navy, the Air Department wasn't meeting the training objectives because they didn't have fleet representative aircraft.

"It's a little hard to train someone to raise a canopy when there isn't one. Or to turn off a switch and dial when they aren't there," Booth who was instrumental in process, said. "The USS Kitty Hawk (CVN 63) was going through their annual training (Feb. 28) and this time they actually got to raise an aircraft because they never had that."

Among the fleet representative aircraft, the Air Department received an EA-6B Prowler, E-2C Hawkeye, F/A-18A Hornet, CH-46E Sea Knight, SH-60 Seahawk and S-3B Viking. These aircraft have all of their parts allowing students to properly train thanks to the strike board and other program managers who "generously" allowed the parts to remain on the aircraft.

Three carriers have already trained with the new equipment along with three large L-class amphibious ships. Halinski said fleet crash and crew salvage officers have been ecstatic with the advanced training commenting, "This is the training we have needed for years."

The Air Department is scheduled to receive an F/A-18F F-1 and an AV-8B Harrier with the possibility of an AH-1 and UH-1 in the near future. The NATTC Air Department trains approximately 500 students with the airframes each year.

Naval Air Technical Training Center (NATTC) Air Department trains with airframes for the following areas:

- Insofar as Crash and Salvage training is concerned we train to the scenario that an airplane has crashed aboard ship, caused a large fire, left the pilot/aircrew unconscious, the engines are still at a high power setting and the aircraft landing gear is so damaged that it can not be towed out of the landing area.
- Aircrew Rescue procedures (how to release the aircrew from the seat restraints and pull him/her to safety).
- Ejection seat and egress system emergency saving procedures (saving the ejection seat so it can not be inadvertently actuated during rescue by the aircrew or the rescue personnel).
- Emergency shutdown procedures (securing or turning off the engines and other systems).
- Normal, manual and emergency aircraft entry (how to get into the airplane to complete the above).
- Salvage procedures using a manufacturer's hoisting sling and a crash crane and salvage procedures using a 20,000 pound capacity forklift and salvage dollies. The forklift picks up one part of the airframe and a wheeled dolly is placed below the airframe taking the place of a landing gear, allowing the airframe to be towed from the landing area on board ship/shore.
- The Fuel School and the Catapult and Arresting Gear School walk their students around the airplanes pointing out the components they will be working with, i.e. fueling ports and catapult holdback parts.

James Braman Assistant Secretary of Transportation for Urban Systems and Environment

In office March 23, 1969 – 1970

President Richard Nixon

45th Mayor of Seattle

In office 1964–1969

Preceded by Gordon S. Clinton

Succeeded by Floyd C. Miller

Personal details

Born James d'Orma Braman December 23, 1901 Lorimor, Iowa, U.S.

Died August 21, 1980 (aged 78) Seattle, Washington, U.S.

James d'Orma "Dorm" Braman (December 23, 1901 – August 21, 1980)[1] was an American politician who served as the 45th mayor of Seattle, Washington from 1964 to 1969. To date, Braman was last Republican to serve as Mayor of Seattle.[2] Previously, mayors were elected for a term of four years, but because of a change in the date of election to odd-numbered years during his mayoral tenure, Braman served five and a half years.

Early life and education

He was born in Lorimor, Iowa, on December 23, 1901. As a child, Braman lived in Oklahoma before his family relocated to Pend Oreille County, Washington around 1908. He attended Union High School from 1916 to 1918, dropping out to work in the family lumber business.

Career

Braman worked in the lumber industry and also designed homes. In 1943, Braman served as a Lieutenant in the United States Navy Reserve. Braman was based in Portland, Oregon and managed lumber procurement. In 1945, he was promoted to Commander and transferred to Washington, D.C. He returned to the Puget Sound region in 1946.

He was elected to the Seattle City Council, serving from 1954 until he became mayor in 1964.[3]

He was appointed by President Richard M. Nixon as Assistant Secretary of Transportation for Urban Systems and Environment in February 1969, resigning as mayor on March 23, 1969 to accept the position.[3][4][5]Braman resigned in 1970 and returned to Seattle after 18 months in the position.

Death

Braman died in Seattle on August 21, 1980 at the age of 79.[6]

2020 HistoryLink article on James d'Orma "Dorm" Braman

Source to HistoryLink article on James Braman : [HW0034][GDrive]

This biography of James d'Orma "Dorm" Braman, Seattle City Council member beginning in 1954, and Seattle mayor from 1964 to 1969, was written by his son, Jim Braman.

Dorm Braman: Kitsap County Years

James d'Orma "Dorm" Braman was born in Lorimor, Iowa, on December 23, 1901. He moved with his family first to Oklahoma and then to the Pend Oreille valley of Eastern Washington circa 1908. His family moved to Bremerton in 1910, where **his father, Jacob Wesley Braman, managed first a lumber mill and later a lumber retail store for the Port Blakely Mill Company.**

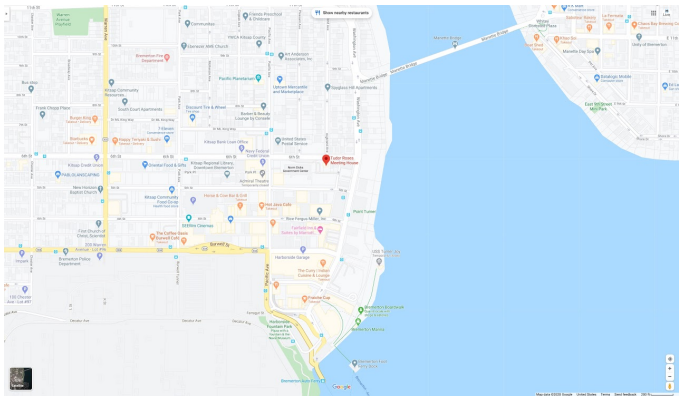
Dorm attended Union High School from 1916 to 1918, dropping out of school late in his sophmore year to deliver lumber for new housing being build as a result of the World War I boom in Bremerton, site of the Puget Sound Navy Yard. With a neighbor chum, Dorm opened a small millwork plant in leased quarters on the Bremerton waterfront in 1919. After he became sole owner of the business, known as Braman Mill and Manufacturing Company, he moved it to larger quarters on 4th Street and in 1930 into a facility built for him at the corner of Pacific Avenue and 7th Street.

The new plant was large enough to accomodate up to 25 workers but unfortunately opened just as the slump of the Great Depression was being felt in Bremerton. Within several years, he was the sole employee. However, his reputation for high quality millwork permitted a build-up of employment as economic conditions eased. Ultimately, the Braman Mill provided millwork such as door and window frames, cabinets, and store fixtures for public and private buildings as far way as Bothell, north of Seattle.

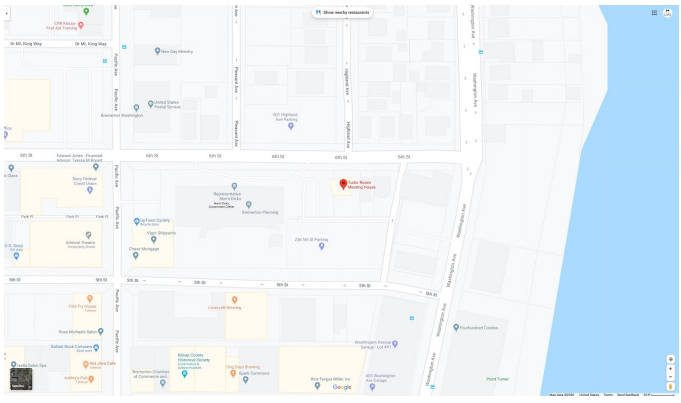
Braman had married a Manette girl, Margaret Veroka Young, in 1902, and had two sons, James d'Orma, Jr. (b. 1925) and Robert Clifford (b. 1927). Although he had no training or experience as an architect, in **1936 he designed and built, with help of several sub-contractors, a large Norman-style home, one of the grandest in Bremerton. This home was registered as an historic landmark in 2000.**

Note - More on this home can be found here - https://www.kitsapdailynews.com/business/tudor-roses-meeting-house-opens-after-long-renovation-period/

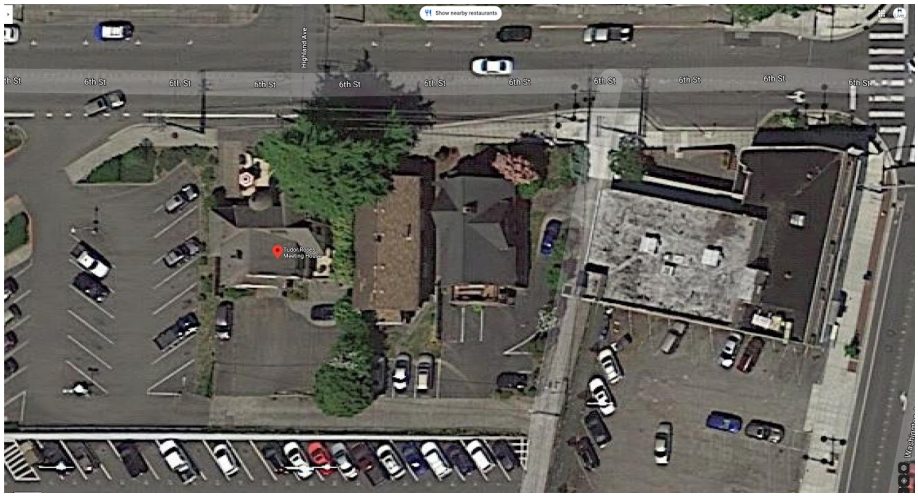
As a child, Bill Sr. spent many of his days next door at the Braman house, home of his best friend and that boy's father, Scoutmaster Dorm Braman.
Source : [HN00Z1][GDrive]



[HW003B][GDrive]



[HW003C][GDrive]



[HW003D][GDrive]

[HW003E][GDrive]

Braman served one term as Bremerton Port Commissioner and was instrumental in the approval of construction of the first ferry terminal in downtown Bremerton designed to handle automobiles. He was active in the Masonic Lodge and the Lions Club. **The latter activity led him to Boy Scout work and he became scoutmaster of Troop 511 in 1937. During his six years of service, this troop became one of the most prestigious in the region. Fifty of the Troop 511 Scouts attained the rank of Eagle and the troop won most scouting competitions for several years. It once took first place in nine of 10 events at a county-wide field meet.**

Dorm Braman, Scoutmaster of Bill Sr.'s troop and later mayor of Seattle, opened Bill Gates Sr.'s to a wider world and was instrumental in his development.
Source: [HN00Z0][GDrive]

[The] log house that Bill Gates Sr. built with his Boy Scout troop in 1939; in front, the bus they drove across the Northwest to national parks.
Source: [HN00YZ][GDrive]

Braman again turned to his drawing board in designing Sundown Lodge, built by boys of his troop near the headwaters of the Tahuya River. This large and handsome facility served first the troop and eventually all the Kitsap District of the Boy Scouts of America for more than 40 years before vandalism dictated its demolition. Troop 511 also traveled widely in an old Fageol bus owned by the troop, ranging as far as Yellowstone and Glacier National Parks in 1939.

In 1943 Braman sought and obtained a commission as Lieutenant in the United States Naval Reserve. He handled lumber procurement for the Navy from an office in Portland and traveled extensively to lumber producers throughout the West. **In 1945, after being promoted to the rank of Commander, he was assigned to the national headquarters of naval lumber procurement in Washington D.C. Braman was instrumental in revising the Navy Manual and in other actions required to carry out President Truman's mandate that lumber procurement for all armed forces be coordinated. He headed the new office responsible for such joint procurement until he resigned to return to the Pacific Northwest in 1946.**

Seattle Years

After a brief stay in Bremerton, he moved to Seattle in 1946, where he purchased a lumber and building materials store in suburban Lake City. Braman Lumber and Hardware became an early example of a full-service home builder store, with sales of lumber, window glass, paint, appliances, housewares, and gifts. A cabinet shop was added in 1950. Dorm was active in the Lake City Kiwanis Club and was one of the founders of Shoreline Savings and Loan Association, which eventually opened branches in many Western Washington communities.

After a broad North End area, including Lake City, was annexed to Seattle in 1954, civic leaders in the area chose Braman to run for Seattle City Council. He ran a non-typical campaign, during which he praised Seattle's clean and business-like government. **Dorm was elected with a greater number of votes than any of the four incumbents who were re-elected at the same election. During most of the ensuing ten years with Seattle City Council he was chairman of the powerful Finance Committee.**

He was a hard-nosed, plain spoken legislator, tight-fisted in budgetary matters. He promoted use of the cumulative reserve fund, into which were deposited savings when City expenditures were less than revenues. This allowed building of some needed facilities without requiring voter approval of bond issues, a procedure that won praise from conservatives but was criticized by some others as a way to avoid seeking public approval of civic projects.

Braman ultimately became the City's representative on the World's Fair Commission responsible for constructing and operating the Century 21 Exposition in 1962. He served as a watchdog in the immediate post-fair period to assure that long-range plans developed before the fair were followed as the fairgrounds were transformed into Seattle Center. His use of the cumulative reserve fund to help in this effort received general support, but use of the same fund to build a new municipal building was controversial, especially since local architects criticized what they called the "Holiday Inn" look of the building.

Braman won two re-election races handily, but during the middle of his third four-year term on city council he was persuaded by backers to run for the office of mayor, since the incumbent had announced he would not seek a third term. He placed first among a large slate of contenders in the primary election of 1964, and defeated Lieutenant Governor John Cherberg in the final by a margin of nearly 12,000 votes. Because of a change in State law, his term was to run five and one-half years, and Braman announced upon election that he intended not to run for a second term. He said this would free him to make decisions based on what he considered best for the city, and not just on what would please the electorate.

There was some bitterness in the local minority community about Braman's election, because he had indicated his opposition to an open housing initiative, which was rejected by the voters at the same time as the mayoral election. Braman stated that his opposition was not based on the principle involved, but on specific provisions of the ordinance that he felt were too destructive of individual property owners' rights. He attempted, with partial success, to gain support of dissenters by appointing minority persons to several important positions, by strengthening the Human Rights Commission, and by establishing a Job Corps in which city departments hired minority youths during summers.

Braman, a life-long Republican, surprised many people, including some supporters, when he appointed several Democrats to key positions on his personal staff. This was followed by a change in attitude about seeking federal funds for local projects and activities. Whereas he had been skeptical about such funding as a councilman, he declared that as mayor he would do his best to get as much as possible of federal taxes paid by Seattleites back to the community. His words were followed by action, with Seattle being the first U.S. city to obtain a federal Model Cities grant. Federal funding for other projects also flowed into the city.

During the summer of 1968, when Seattle began to feel the urban unrest spreading through American cities, fueled at least in part by the Vietnam War, Braman visited African-American neighborhoods several times during periods when acts of violence were occurring, to the dismay of the police chief. One night during the height of the unrest he ordered that demonstrators threatening violence be arrested. He appeared at a local police station in the middle of that night to thank police for their resultant actions, which appeared to head off a potential riot.

Other significant progress was made during his five-year term. He threw City support behind the citizen-led Forward Thrust bond program, organized to gain support for facilities to serve the expected growth in metropolitan area population. The end result was voter approval of six major bond issues in 1968, constituting the largest bond program ever approved at a local level in the U.S.. Braman, however, was deeply disappointed that the rapid transit issue failed to gain the required 60 percent positive vote, although a majority of voters supported it.

Braman also worked to obtain from the federal government title to Fort Lawton and to assure that its site would be used park purposes. With support from the Washington State congressional delegation, particularly Senator Henry "Scoop" Jackson, this was accomplished, and the great majority of the area became Discovery Park, Seattle's largest park in acreage.

Braman had become increasingly convinced that comprehensive transit systems, including rail transit, integrated with land use planning was necessary to avoid future congestion in Seattle and other American cities. He became a national leader in the effort to obtain reliable federal support for transit, working closely with the National League of Cities and the U.S. Conference of Mayors to this end. Ultimately, this work led to his appointment by President Nixon early in 1969 to a newly created federal position, Assistant Secretary of Transportation for Urban Systems and Environment.

Working for Mass Transit in Washington D.C.

Braman had gained a reputation for straight talk, even blunt talk at times, and this and his many accomplishments during his short period in office resulted in widespread praise from the press and from civic and political leaders of both parties when he left Seattle for Washington, D.C. Local papers referred to him as the best mayor Seattle had ever had.

Braman went to Washington for two reasons. The foremost was to obtain a more stable source of federal funding for transit projects in general, and specifically for Seattle's proposed rapid transit system. Failure at the polls of the 1968 transit issue stemmed at least partly from lack of certainty of federal funding for the project. A secondary objective was to assure that environmental consequences of federally-supported transportation projects be considered more carefully in the decision-making process.

Braman had always been a pragmatic environmentalist. His experience with the Boy Scouts, followed by a lifetime love of skiing and hiking in his beloved Pacific Northwest mountains, gave him an appreciation of the natural environment. However, his experience in business and government lent a tempering influence on environmental controls so that they not be harsh enough to completely stop reasonable development. These factors influenced his performance in D.C.

Braman carried out his assignment there with the type of determination (some called it bull-headedness) that characterized his work in city government. Twice when he felt that important principles were being compromised for political reasons he told the Secretary of Transportation that he was going to resign and return to Seattle. Since he had the support of many local governmental and environmental groups, his resignation would have been political dynamite, and he ultimately prevailed both times.

Freeway projects in New Orleans and San Antonio that were potentially harmful to the urban environment were stopped, and ones in Memphis and New Hampshire substantially modified. Even more important in the long term, he succeeded in obtaining passage of legislation securing continuing federal funding for urban transit projects, even though the highway lobby and initially President Nixon himself opposed such legislation.

With 80 percent federal funding for Seattle's rapid transit assured, the matter was submitted to a new public vote. The timing was unfortunate, since the big "Boeing bust" of late 1969 was in full sway, and voters once again failed to approve the system, even though local taxpayers would cover only 20 percent of the total cost of the project. Funds earmarked for Seattle went to build Atlanta's rail system instead. Braman was discouraged by the result, and shortly later resigned his federal position and returned to Seattle in 1970. He received unusual praise from the *Washington Post* and other papers around the

country for the great accomplishments during his 18 months in the position.

In Seattle, Braman resumed service on the **Board of Directors of Shoreline Savings**, served as President of the Chief Seattle Council of the Boy Scouts, and for a short time was member of a national transportation advisory board. However, he never again was active in civic or political affairs. He remained physically vigorous, skiing and hiking until he died quietly in his sleep at home in 1980, at age 79.

BREMERTON

A building on Highland Avenue, built in 1942 and recently used by the local Plumbers and Steamfitters Union, has been torn down to make way for a further expansion of Evergreen-Rotary Park.

Last year, Bremerton purchased the building and its .16 acres near the abandoned Chevron fuel facility, which is scheduled to undergo a final cleanup next summer, said Tom Knuckey, managing engineer for Bremerton Public Works.

When the project is completed, Sheldon Boulevard will continue onto Highland, and the existing extension of Highland will be incorporated into the park.

During the early part of the 1900s, the area was used as a lumber mill operated by the Bremerton Lumber Co., according to research by Western Shore Heritage Service, a consultant for the city. The old concrete building was built in 1942 as a machine shop. In the 1960s, fire gutted the building, which was repaired and later expanded. It was recently used for offices and welding classes.

When the demolition is complete, the site will become a gravel lot for overflow parking at Evergreen-Rotary Park, Knuckey said. Next summer, the site will be used to store contractor equipment during the cleanup of the Chevron property.

The Chevron site was scheduled for cleanup this past summer, but bids came in higher than anticipated, Knuckey said. The project will be rebid early next year.

Under current plans, soils will be removed on a portion of the Chevron site. The rest will be treated with special chemicals to oxidize the petroleum compounds so the resulting organic chemicals can be eaten by bacteria. The process will use heavy equipment to stir the soils while injecting the oxidation chemicals down to about 15 feet deep, Knuckey said.

On drawings of the future park, the Chevron property is designated as the terminus of the proposed Bremerton Boardwalk, an overwater structure that has drawn fire from the U.S. Fish and Wildlife Service, Suquamish Tribe and some environmental groups. The U.S. Army Corps of Engineers is reviewing an application for the boardwalk.

The demolition of the plumbers building, cleanup of the Chevron property and expansion of the park have no apparent opposition.

Braman - 1969 Senate Hearings

Source - [HG005V][GDrive]

NOMINATION OF HON. JAMES D. BRAMAN, MAYOR OF SEATTLE, WASH, TO BE AN ASSISTANT SECRETARY OF TRANSPORTATION

The CHAIRMAN. The next nomination, the Chair takes great pleasure in announcing this, is that of Mr. James D. Braman .# Washington to be Assistant Secretary of Transportation.

I want to tell the committee he isn't walking very well. He thinks he is a skier, and he forgot that he isn't as young as he used to be.

Senator Cotton. He had better select some safer method of transportation.

The CHAIRMAN. He had a little accident. That is why he couldn't be here on Monday. But, Mayor we are glad to have you here, and we will put your biography in the record in full.

(Biography of Mr. Braman follows:)

JAMES D'ORMA BRAMAN

Born December 23, 1901, Seattle, Wash.

The President of the United States has nominated Mr. J. D. Braman to be an Assistant Secretary of the Department of Transportation. Mr. Braman will serve as Assistant Secretary for Urban Systems and Environment. In this capacity, he will be the Secretary's principal staff adviser on urban transportation affairs and on the relationships of transportation programs to the social and physical environment. His sphere of staff responsibility will include review and planning of transportation programs in the urban areas, coordination of the Department's urban programs with those of other Federal, state and local agencies, and development of programs to assure that environmental factors are given their full weight in all transportation decision-making.

Mr. Braman has been Mayor of Seattle, Washington, since 1964. For the preceding ten years he had been a member of the Seattle City Council and served as Chairman of its Budget and Finance Committee from 1956 to 1964.

During this period he was the City's representative on Washington State World's Fair Commission and Century 21, Inc., in developing and staging the 1962 Seattle World's Fair, the "Century 21 Exposition." He handled the redevelopment of the Fair site into the present spectacular "Seattle Center."

Mr. Braman has extensive experience in the subject areas of the position for which he has been nominated. He has been Chairman and Board member of the Transportation Committee Municipality of Metropolitan Seattle (METRO), which now is completing a $150 million water pollution control program and which is responsible for transportation system development. He is an Executive Board member of the Puget Sound Governmental Conference, a four-country land and transportation planning agency, and of the Puget Sound Regional Air Pollution Control Agency. He is Chairman of the Transportation Committee of the National League of Cities, also representing in this capacity the United States Conference of Mayors, of which he is also an Advisory Council member.

He has served on the Urban Transportation Advisory Council of the Department of Transportation and on the President-Elect's Task Force on Transportation.

Before coming to public service in Seattle, Mr. Braman had a distinguished business career as President and Chief Executive Officer of the Braman Lumber & Hardware Co. of Seattle from 1946 to 1956 and President and Manager of the Braman Mill & Manufacturing Co., Inc., of Bremerton, Washington, from 1929 to 1943. During World War II, Mr. Braman served as a commissioned officer in the Navy Supply Corps and was responsible for procurement of all West Coast lumber needed by the Navy and later was in charge of all Navy lumber programs.

Mr. Braman has been President of the Lake City Chamber of Commerce of Seattle, President of the Associated Lumber Dealers of Seattle and of the Seattle Retail Hardware Association, and **from 1940 to 1943, President of the Bremerton Port Commission**. He has been active in Boy Scouting since 1932 and holds the Silver Beaver Award. He has been affiliated with Masons, Scottish Rite Bodies, Shrine, American Legion, Kiwanis, Urban League, Seattle Chamber of Commerce, Municipal League, Central Association of Seattle, and the Y.M.C.A.

Mr. Braman is an active outdoors sportsman. He is married to the former Margaret W. Young and has two sons and three grandchildren.

The CHAIRMAN. He has had some extensive experience in all forms of urban problems, urban systems, and urban environment and transit problems, and I think the Department of Transportation is very fortunate in being able to have him come down there and work on these particular problems which are so important to the country. So, I welcome you here as a fellow citizen of mine at home.

STATEMENT BY Hon. HENRY M. JACKSON, U.S. SENATOR FROM THE STATE OF WASHINGTON

Mr. Chairman, I want to thank you and the members of the Senate Commerce Committee for availing to me this opportunity to speak in behalf of the distinguished nominee for the position of Assistant Secretary of Transportation, Mayor J. Dorm Braman of Seattle.

Dorm Braman has been an excellent mayor for the past five years. Prior to that time, he served for ten years with great distinction as a member of the Seattle City Council.

When Secretary Wolpe announced a few weeks ago the selection of Mayor Braman as Assistant Secretary of Transportation for Urban Systems and Environment, I said then that it was an excellent marriage of the man and the job.

I commend Secretary Wolpe for creating this position within his department to deal with the total urban problem as it relates to transportation and in addition the question of the quality of the environment.

I congratulate the Secretary on his choice of Mayor Braman, who has taken such a keen and contributing interest in our nation's transportation problems through his role as Chairman of the Transportation Committee of the National League of Cities. And, as he evidenced on many occasions, he knows and cares about the urgency of improving and preserving the quality of the environment.

Early in the 90th Congress, it was my role to serve as floor manager of the bill creating the Department of Transportation. Since then I have watched the development of this department with great interest. In drafting the legislation, we specifically provided for certain safeguards covered in Section 4–F and 2–B–2 guaranteeing that the new department would establish appropriate environmental criteria. As Chairman of the Senate Interior and Insular Affairs Committee, I have been keenly interested in this entire field. Only recently I introduced legislation calling for a Council of Environmental Advisors in the Executive Office of the President which could advise the President on this great and complex problem area that crosses the bounds of many departments of government.

I want to say that I am heartened that the questions of environment involving the Department of Transportation will be in the hands of such a sensitive and knowledgeable person as Mayor Braman.

It reassures everybody that such a vigorous proponent of balanced transportation systems is placed in a position where he can contribute to national policy.

And it is most encouraging to see a man with such a keen appreciation of conservation and environmental values appointed to this key position.

I believe a recent comment of my colleague, the Chairman of this Committee, is most appropriate. The Chairman said: "Mayor Braman understands that the need for new technology must be balanced with the need for a safe and human environment."

Mr. Chairman, as you well know, the elevation of Mayor Braman to this national office is a worthwhile development for our nation. However, we will miss the excellent counsel and assistance he provided to us as Mayor of Seattle. Our ability to work hand in hand with the Mayor on matters of deep concern to Seattle was in the finest spirit of bipartisan cooperation.

He has been a progressive mayor. Under his leadership, Seattle obtained the first model city program in the United States to be approved and funded. He is one of the nation's pioneers in the design team concept for community planning which takes into account human values as well as traditional technical considerations. As a councilman he was a chief spokesman of the city government in bringing about the highly successful Seattle World's Fair which has resulted in a magnificent on-going community center.

I am happy, Mr. Chairman, to urge Senate confirmation of Mayor Braman so that he can began his important work in the executive branch of the government.

We of the State of Washington are proud of his past accomplishments. We look forward to sharing his talents with the nation.

The CHAIRMAN. This office to which you have been named, and I have discussed this with the Secretary, too, Secretary Volpe, is considered a new one in the Department of Transportation. That is not particularly unusual because the Department of Transportation is new itself. It is a new Cabinet office. If you have come to some conclusions, it would be helpful to the committee if you would briefly provide an outline of what you conceive it to be and the organizational structure of your office as Assistant Secretary.

Mr. BRAMAN. Thank you, Senator Magnuson and gentlemen of the committee.

First, let me say I appreciate your kind remarks and your explanation of the rather halting way in which I approached the table. I do enjoy skiing and for the first time in 25 years I had a very untimely accident just before having to come down here.

I have prepared a very short statement.

The CHAIRMAN. We will be glad to hear that.

Mr. BRAMAN. Then, I will be very happy to respond to your questions.

The Office of Assistant Secretary for Urban Systems and Environment is a new one in the Department of Transportation, which has been created by Secretary Volpe because of his deep concern about the problems of metropolitan America. He is resolved to make certain that urban policies which emanate from his department will be re viewed and reconciled by this new office.

For the past 15 years, I have been intimately involved in municipal government. The first 10 years were spent as a member of the Seattle City Council, where, as chairman of the finance committee, I was required to cope with the fiscal dilemma, one which practically all cities

ace—that of increased demands for services with limited resources available. In 1964 I became mayor of Seattle. Since that time, our community has shared with others the agonies of swiftly moving social change. We have been fortunate by contrast with some of our sister cities, but, like in Alice in Wonderland, we have had to run awfully hard to stay in the same place. We in Seattle are proud of the community support we have been able to develop, with concerned citizens representing a broad spectrum of our city. The fact that our model city effort was the first in the United States to be approved and funded is national recognition of the success of our efforts to get meaningful local citizen participation.

I want to acknowledge the wise counseling of our two illustrious Senators, your chairman, Warren G. Magnuson and the chairman of the Senate Interior Committee, Henry M. Jackson. These gentlemen have always been available for counseling, and I am afraid we in Seattle have taken unfair advantage of their accessibility. They have been a tower of strength to me in discharging my responsibilities as mayor. I sincerely hope that I will be able from time to time to continue to benefit from their advice. I welcome, of course, the advice and counseling of all members of this committee.

In addition to my other responsibilities, I am serving on the advisory board of the U.S. Conference of Mayors, on the executive board of the National League of Cities, and for the last 3 years have also served as chairman of the transportation committee of that organization. In the latter role, I have had an opportunity to become informed on urban transportation problems in other sections of our country.

This has given me an opportunity to develop a national perspective.

In addition to speaking before many of the nationally recognized transportation organizations, I have had the privilege of testifying on several occasions before committees of the U.S. §. as well as committees of the House of Representatives.

In my city administration, I have assigned No. 1 priority to the resolution of our transportation problems. The crisis of urban America will not be solved by a balanced transportation system, but until all citizens have full access to their community, we cannot hope to achieve a permanent solution to our social problems.

I have sensed a growing awareness by all elements of our society that the old ground rules were no longer valid. New concerns were involved when we started constructing transportation facilities in our more densely populated urban areas. Citizens have, with increasing vigor, demanded that the views of all those affected be heard.

The problem has two elements: (1) the need to develop a transportation system for urban areas wherein the components will complement each other rather than be competitive, and (2) that appropriate attention be give to the human values which are affected—a concern about improving the quality of our

than be competitive, and (2) that appropriate attention be give to the human values which are affected—a concern about improving the quality of our environment.

The mission of the Assistant Secretary for Urban Systems and Environment will be to coordinate the policies, programs and resources of the Department of Transportation with public and private efforts to Solve urban and environmental problems; to develop and test new procedures, techniques and methods by which transportation development can be made more relevant to urban and environmental needs and goals; and generally to make the offices and agencies within the Department more responsive to the needs of cities and more sensitive to the protection and enhancement of the environment.

Secretary Volpe has designated the office for which I have been nominated to be the focal point within the Department for the resolution of questions as between the various modes, such as highway, rail, buses, and air, where they are part of the urban complex. In addition, the office will have the challenging responsibility of being concerned about the quality of the environment wherever transportation has any impact.

I approach #. assignment with the knowledge that the challenges are great and the solutions are debatable. I do feel that my previous experience and my enthusiasm for this assignment will enable me to make a contribution.

That concludes my prepared remarks. I will attempt to answer any questions that you may care to ask.

The CHAIRMAN. I think you generally outlined in your last two paragraphs what you conceive in a broad way what this new office will do.

I know that you can't be very definitive about many of these things because you have to start out down there new as far as the Depart ment is concerned, and the Department itself is just beginning to feel its way. It was just created, as you know, a short time ago. I think when you talk about the environmental needs and goals, that all of this has got to fit into a pattern such as we have tried to do in Seattle, and we were honored by the model cities the first month, involving so many other things than just one phase, say of transportation.

I think you have sensed the feeling of this committee in that respect, because we are going to have a subcommittee of this committee, which will be new for us, although we have been around the periphery of all these things, on that very thing, environmental approaches to the problems of the urban population. -

You mentioned the old rules may not apply. Surely, your concept of this is in tune with the times, in my opinion.

Senator Cotton, do you have any questions?

Senator Cotton. No. I have listened to the colloquy that you have had with Mr. Braman, and I would say that if you want him and the President wants him that the rest of us would be wasting our breath to try to stop it, so I am for it.

I will be very happy to vote for your confirmation. I have no questions.

The CHAIRMAN. Senator Spong.

Senator SPONG. Mr. Chairman, it has been my privilege to hear Mayor Braman when he has testified before the Roads Subcommittee of the Public Works Committee during the 90th Congress. I would like to add to what you have already said. I believe the Department is most fortunate to have a man of his experience.

I would like to say in observing the mayor's statement the statement that "there is a need to develop a transportation system for urban areas

wherein the components will complement each other rather than be

competitive" that I wish him well.

I think one of the very apparent problems everywhere—and it is probably no more apparent than right here in the Washington metropolitan area—is the unfortunate uncompetitiveness between those who build highways and want highways and freeways and those who recognize the need for a mass transit system, when in effect here, as

I am sure in many other places, both are going to be necessary.

I would also like to say I am delighted that we are going to pay some attention to the environmental factors in transportation.

. I would like to ask Mayor Braman if you have any comment on the regulations recently adopted with regard to hearings in the condemnation of property under eminent domain proceedings that the Department of Transportation recently enacted.

Mr. BRAMAN. This has been referred to as the two-hearing procedure. The fact of the matter is in many State jurisdictions this has been in effect to a degree, but the timing hasn't been quite as contemplated by the Department regulation. I personally support a regulation of this type. Certainly, many of us have some questions relative to the appeal procedure that was written into it, and I believe to some degree that has already been corrected.

As far as the procedure of having the hearings, a corridor hearing early, before anything has become fixed in the minds of the designers,

I think it is the approach to reaching the community problem that seems to be developing every time a major facility is planned in an urban area. Then, of course, later when we get to What is known as the access hearing, which comes more to the actual design, the configuration of the interchanges and things of that nature, then, again, the community should be heard. Contrary to some statements that have been made that this will delay the process of construction to a degree that will work to the public harm rather than good, I don't subscribe to this. I believe that having gotten these things out of the way at the proper time will actually accelerate the ultimate construction rather than delay it.

In our own city, for example, we have a major construction item that was proposed to have gotton underway some year and a half to 2 years ago, and it is still nowhere near starting because of the almost overwhelming public protest on the fact that it had been designed in such a manner it destroyed a large amount of very valuable property but more importantly it impacted very heavily on our minority or less privileged community. The result is we are going to end up in my opinion with a considerable longer delay than would have resulted had we gotten to where we are now through the model cities procedure where I think we are going to come to an amicable conclusion of this.

I believe it is a good regulation with some modification of the appeal.

enator Spong. Thank you very much. I certainly look forward to hearing fom you some more.

The CHAIRMAN. The Senator from Wyoming.

Senator HANSEN. Thank you, Mr. Chairman.

I am pleased to be here today to hear from you, Mayor Braman. I wanted to say that as a member of the Special Committee on Aging and some other committee work I have done I do have some sensitivity for minority groups, and I think it has been demonstrated repeatedly that the full economic impact and the full economic loss cannot be assessed as easily as one might suspect. Oftentimes the location of a road can shut off or can cut off from a merchant his clientele. It may be a little neighborhood store and it may be a particular ethnic group has patronized his store, and if he is separated from those to whom he has looked for the major share of his income, he may not have had his building touched at all and yet he has suffered a real and very substantial economic loss.

I think, too, that older people oftentimes, as we uproot them and move them someplace else, we do great violence to them. We move them from their friends, from their acquaintances, and these are difficult things to put a price tag on. So, I would hope as we get on with the job of trying to improve our transportation system, to modernize it, and to make it so as to be more equal to the task that it faces that we might also have in mind that because a blighted area is run down, it may seem to be a logical place to root out and use for a transportation system, in terms of human values that may not be the best place. It may be that you could put it someplace else and that the people who thus would be uprooted would be far more able to adiust themselves to the impact than some of those that we would consider to be in very low income status and would agree on the basis of other criteria to be a logical place for highway extensions.

These are just ideas that I wanted to toss out that I hope you might give consideration to. I have every reason to believe that you will.

Mr. BRAMAN. Senator, I concur fully in the remarks that you have made. I would like to point out that the basis of the kind of design that I hope will become common throughout the country is the design team concept which includes not only the engineering designer but also the urban design concept and the economists, sociologists, the architects, so in fact we get to the total cost of a project which includes the non quantity values that you have mentioned.

We have been inclined to go only on economics, what it will cost to lay a strip of concerte or rail or what have you from a point to a point to serve a purpose, but we have failed to recognize the nonquantity costs which are very important, which now as we get into this more deeply, into the consideration of human values, must be added to the measurable costs.

I agree fully with what you have said, sir.

Senator HANSEN. I have no further questions, Mr. Chairman.

The CHAIRMAN. That brings me to a question that I am going to ask the mayor. I am sure you feel that whatever your jurisdiction down there will be in these

urban problems, that it extends beyond just a city boundary, the city limits, that it is a conglomeration of things all around it, it has all got to fit into an area.

I was thinking of my friend from Virginia who down in the Norfolk area, the city boundaries don't mean anything.

Senator SPONG. We are all connected by tunnels. There are so many I think we are moles at times.

The CHAIRMAN. They have a transportation problem which includes water, too. When you talk about saying you will be involved in something in his area, you can't just use city boundaries for the environment, you have got to use the whole thing, and the same thing in a sparsely settled State like Wyoming.

I am sure even though you are mayor of a city, your responsibilities go way beyond the city limits.

Mr. BRAMAN. That is correct.

The CHAIRMAN. Not your political responsibilities, but your others.

Mr. BRAMAN. No, the responsibility to the public you serve is broader than the city limits. I would say that the whole basis of the plans which we hope to develop for urban transportation are based on regions rather than on political jurisdictions. The plan must be a locally developed plan to serve a region after which we must find ways to implement it and make it come into being.

The CHAIRMAN. The quicker the cities start to think in those terms in planning, which I think we have been in the forefront out there, the more we are going to reach some solutions.

The Senator from Pennsylvania is so familiar with this. The problem of Philadelphia is not the city limits of Philadelphia.

Senator Scott. No, sir; it is not. Philadelphia County and Philadelphia City are coterminus, but our traffic, transportation, and population mode is regional. Yet, the counties are often very jealous of any °al proposals. However, we surely are coming to that sort of

1ng.

The CHAIRMAN. Now, the problem, of course, in the heart of the urban areas is to try to coordinate the various modes of transportation,

whether they be underground or surface or rapid transit or elevators, such as our monorail even in our own hometown. But it is a big job, and I am so pleased that the Secretary has seen fit to make this a special project and a special office which you are going to take hold of.

Senator Scott, do you have any other questions?

Senator Scott. I don't think so, Mr. Chairman.

The CHAIRMAN. Senator Moss.

Senator Moss. Thank you, Mr. Chairman. I don't think I have any questions of the mayor. I wish him well. I know something of his distinguished career in Seattle, and I am most happy that you are assuming this position which, as this colloquy has developed here, is of growing importance and complexity in the areas around our great cities. It isn't the cities only but it is all of the metropolitan area or even beyond that which may include several political jurisdictions and as such offers knotty problems in that regard that must be resolved.

So, I am pleased indeed with your nomination, and I know that you will do a fine job.

Mr. BRAMAN. Thank you

Mr. Chairman, if I might comment along the lines of the last two or three remarks. Actually, the problem is a regional one. Certainly, the coordination of modes of transportation is important in developing a regional plan, and this plan must be developed locally because of the different conditions that exist at different localities. For example, cities like New York, San Francisco, Pittsburgh, Seattle, and many others have a geographical and topographical situation because of waterways, hills, and so forth, that give them an entirely different problem than the Plains cities such as Phoenix and Denyer, et cetera.

So we must have a way to get away from the competition between highways and other modes and find a way in which all of them can serve their best and highest purpose in a total plan. It may be some areas that for one or two decades it will largely be based on §°

In other areas such as ours there has to be a mix on perhaps a one-third/two-thirds basis of some type of mass transportation coupled with highways. The point I want to make very clear is my purpose in my past activities as well as approaching this new assignment is not an attack on highways per se. I think that all of these modes have a proper place.

I think we have to be reasonable in our approaches. But I think we have to have a better approach to make sure that each serves its purpose in relation to the other so that ultimately we come up with the maximum with the least damage, though there will always be some damage when you construct major facilities of this type.

Senator CottoN. I am very much interested in this discussion. I hope that in your laudable desire to coordinate the various forms of transportation you are going to carefully protect and guard our Interstate Highway System until it is completed. I was on the Public Works Committee years ago when that project was passed through the Congress. We fought for it. We lost in our committee the first year by one vote. We passed it through the Senate the second year by one vote. I think if the Senate voted once more on it, it would be almost unanimous.

Yet, from time to time, with the best motives in the world, people want to keep dipping into the trust fund for not extraneous purposes

but some particular purpose that delays the completion of the Interstate System. To me an uncompleted Interstate System is just like a bridge with one span out of it. It is not quite as bad as that, but I think it is important that we complete that system as laid out before we start adding to it and before we start diverting any funds anywhere else.

diverting any funds anywhere else.

I wonder if you feel that way?

Mr. BRAMAN. I certainly do. I have always taken the position in all of my activities in the field of transportation that the Interstate Highway System, I think, is one of the great monuments of the past decade in public works. I certainly agree that the Interstate System which has made it possible to connect our urban areas across the Plains and the mountains with fine highways has been a great achievement and it must be completed. There must be provision made to continue to update—update and maintain it after it is completed.

I think as we approach the next phase, postinterstate, as I call it, we must determine how these funds still devoted for the purpose of providing right-of-way for rubber-tired vehicles can be best used in

Solving the next phase which is the internal problem in the urban areas, and at no point have we advocated either abolishing this fund or diverting funds out of it for other purposes, because we foresee more needs in this field than could ever be met even out of all the funds that are available. But there must be a way provided to give the same type of assured financing to the other modes so that when you plan a total system you don't have an assured method of constructing a portion of it and not the other, which means the system will never be constructed.

Senator CoTTON. I realize that, and I realize that is the need of the hour now as it was the need of the hour 10 or 12 years ago when we started this system. The need of the hour now is just what you are talking about, of course: the urban problem. I am sure that you are the ideal person to undertake this. -

Everybody now has some route that they want to add to the Interstate System. In the name af beautification or something else, everyone wants to add to the system before it is completed and laid out.

Everybody has pet projects on safety or beautification or something ...that is highly laudible but they want to divert some of the trust

S.

I know that your great challenge will be urban transportation and opening up the cities, but I am reassured when you tell us that you are not going to let that interfere with the completion of this Interstate System as it was laid out. Then comes the problem of who gets what priorities, and you are better versed in that than we are. -

Mr. BRAMAN. Senator, I can assure you that this is directly in line with my thinking, and I believe as far as I am privileged to state for the other cities, who are affiliated in the league, that this is thought as well. We must complete the Interstate System. You will note I have always used the term “postinterstate.” In other words, we must complete the Interstate System, and I agree with you we should be very cautious about indiscriminate additions to the system. We have to complete the system, we have to provide for its maintenance and some degree of improvement, which means some, where needed, minor extensions, but I think we need to direct our attention postinterstate to the other commanding problems of the metropolitan communities.

Senator CottoN. Of course, when I come down to see you in a month or two representing my State and asking you to be in favor of one new little highway on this Interstate System, you are going to know exactly what to say to me.

Mr. BRAMAN. I left a little loophole there, if you noted, with some moderate increases perhaps

Senator Scott. Mayor Braman, are you familiar with the history of our suburban transit in the Philadelphia area where passenger fares have actually been substantially reduced, in a typical instance from 60 to 35 cents, with about 35 cents round trip on our Penn Central and Reading Railways, and that, as you know, was done by assistance from the cities to the transit company, perhaps from the State, and perhaps to a degree from the Federal Government, but fundamentally it was a city-assisted program? I assume you are aware that as a result of that many people who formerly drove their auto mobiles into town —this includes myself—will now leave the automobile at a parking spot alongside a suburban railway station and ride in in comfort. This isn't the Long Island Railway, so we ride in comparative comfort.

You are familiar with the success of that operation, are you not?

Mr. BRAMAN. I am to a limited degree, Senator. I am not intimately informed on it. I do know of it, and I might say that as part of the Transportation Committee of the National League of Cities I have had the pleasure of having Mr. Edward Tennyson from your city as one of my members. He has been very helpful.

Senator Scott. I am glad that you are in consultation with him.

This was brought about by former Mayor Dilworth, of Philadelphia, who is entitled to the credit for having thought of this imaginative thing.

Are you familiar with the opportunities offered to General Electric and Grumman to bid on a prototype of a cushioned-track vehicle primarily, I understand, for transportation in the 300- to 500-mile range to supplement the short-run air carriers?

Mr. BRAMAN. Senator, I am only aware of these new proposed programs for innovative forms of transportation in a broad sense. Actually, within the Department under another Assistant Secretarv will be the Department of Research and Development which would have cognizance of that type of thing. -

Actually, the design of a system to use would fall in my area of Concern.

The CHAIRMAN. But supposing they think this is a good design or something new, I envision that they have got to come and clear with your place “Does it fit in 7”

Mr. BRAMAN. This is what I am referring to, the design of a system using any mode would be under my concern. The development of innovative new procedures would be theirs.

Senator Scott. This cushioned-track vehicle, I believe the present planning is for a test area, and there is competition for it from Texas and Colorado and New Jersey for a 48- or 60-square-mile area to test out these cushion-track trains.

The only operating train I know of on a test track of about 20 miles is the Pitin from Paris to Orleans.

The CHAIRMAN. We have the monorail.

Senator Scott. I know you have the monorail. This is an air cushioned system.

Mr. BRAMAN. Is it an air-cushioned system, Senator?

Senator SCOTT. It is an air-cushioned system and is said to be very quiet and extremely fast. It can maintain speeds of 300 miles an hour, and its potential is 500.

Now, I have bad news for the Senator from New Hampshire. The tell me with the institution of the cushioned-track vehicle, if adopted, the suburbanite will have his home in New Hampshire and work in New York and that this will be an hour's ride. So, I just want the Senator from New Hampshire to get ready to become

Mr. BRAMAN. I think the air-cushioned vehicle, particularly a track vehicle, is probably the one that has the greatest potential of being attractive at this time that they tell me.

Senator Scott. The engineers tell me of all the various proposals, the tunnel, the air-push type of tunnel, the monorail, the overhead, and all the rest of them, that the air-cushioned, single-track vehicle is probably the most feasible, and I do hope you will encourage development on that.

Mr. BRAMAN. We are going to have an entire office devoted to that, and I am sure all of us are going to be much concerned about it in the Department. I think there is one thing we have to remember that we have some demanding problems existing at the moment in our cities. For instance, rail lines, such as you have mentioned, can be converted to serve that way. Some have no such ability. We have none in Seattle that can serve that way. We are getting to the point as they develop the right kind of plan and the local support and, hopefully, additional F. support, we will have to construct something. I don't think we can ever wait for the quantum system. In other words, there will come a time when we will use the best thing available and we will go ahead and contstruct knowing that just around the corner will probably be something better.

The only thing we can do is to try to design the system we do con struct to make it adaptable to the broadest scale of new development.

For instance, tunnels should be so designed to suit air-cushioned tracks and what have you. I think you have to get to the point where you have to make up your mind we have to go ahead and build something, no matter what the future would hold.

The CHAIRMAN. I would say the No. 1 priority also in every big urban center today in the United States is easy access to their airport.

Mr. BRAMAN. Yes; right.

Senator Scott. Cleveland is the great example of that.

The CHAIRMAN. This is what they want most of all right now, if they don't have it. This has got to fit into the Interstate System, but this is almost a No. 1 priority with people.

Mr. BRAMAN. It ties in directly with the concern about airports and airline operation.

The8. This committee is going to have to labor with that problem very soon, what to do about the airport situation, and that involves access, ingress, and egress to the airports.

Look at your problem of air °: which is going up like this. Are you going to run big trucks out to the passenger airport terminals, and things like that. It all fits into what your job is going to be.

Mr. BRAMAN. That is right. Actually, we must get to the point— this thing extends itself step by step. We get to the construction of airports and terminals. In our city, Senator, there now is, as you know, under construction a 5,000-car parking garage, an excavation some what reminiscent of the Grand Canyon, and at the moment because of lack of funds or means by which a coordinated plan could have been developed, this new installation contains no provision for a rail terminal. It should have provisions not only for the rail terminal, but the automated handling of baggage and freight, but it doesn't.

We have got to get to the point where these things are not built without consideration of the other facilities.

The CHAIRMAN. You have got a big challenge down there.

Senator Scott. Mr. Chairman, you have got a lot of witnesses, and I don't want to delay, but I would also like to suggest to you a fascinating experiment that was tried out at Philadelphia airport. I saw the television demonstration of it. They take one of these very large helicopters, and it is equipped to reach down and grab a busload of passengers downtown. Then the helicopter and bus all together go popping across the atmosphere, and in a few minutes they land right at the airport, drop the bus, and the bus tottles off to the passenger depot, and the helicopter goes back and grabs itself another bus. It is very fascinating.

Mr. BRAMAN. Senator Magnuson kind of shuddered at that thought, but actually there is nothing so fantastic that it doesn't contain some possibility if we go far enough out into the future. So this could have

Some merit if we develop this thing.

Senator Scott. I hope it doesn't develop bad habits and start grabbing automobiles.

Mr. BRAMAN. That is right.

The CHAIRMAN. If there are no further questions, we would like to

thank you very much.

Mr. BRAMAN. I would like to make one closing remark. As previously stated, this is a new office. Secretary Wolpe has chosen to take some duties out of one

of the established offices and put them in other offices in order to open up a place for this operation. We have nothing to start to work with. We are going to have to develop from scratch.

We can't promise results too early because we have a whole structural organization to develop.

I would hope as time goes on and as I and others in the Department come to the Senate and to the House for support, that we will have your understanding as we try to find answers to these problems. It is going to take a great deal of understanding and support by all of us in the Government if we are going to solve this problem. Thank you very much.

The CHAIRMAN. Thank you very much.

King Olav V of Norway visits Seattle area from May 1 to May 4, 1968.

From May 1 to 4, 1968, Norway's King Olav V (1903-1991) makes his third visit, and first as king, to the Seattle area. At every stop he is greeted enthusiastically by large crowds, many of them from the region's substantial Norwegian American community, and the king declares that he "feels more at home in Seattle than in any other United States city" ("King Olav's Visit ...").

Olav, whose full name was Alexander Edward Christian Frederik of Gluksburg, had visited Western Washington twice as Crown Prince. In 1939 he and his wife, Princess Martha (1901-1954), spent a day skiing at Paradise on Mount Rainier and attended the dedication of the Toftezen (or Taftezon) Memorial in Stanwood, Snohomish County, which honored the first Norwegian settler on Puget Sound. During a 1942 visit, Olav explained Norway's position as a country occupied by German troops.

In 1968, Seattle was just one stop on the Norwegian monarch's tour of the United States. King Olav arrived from San Francisco on Wednesday afternoon May 1 and had dinner that evening at the Rainier Club with Governor Daniel J. Evans (b. 1925) and Mayor Dorm Braman (1901-1980).

On Thursday, May 2, the king visited the University of Washington College of Fisheries, a group of demonstrators waited for the king with signs reading "Scandinavia Unite as a Neutral Republic" and scuffled with another group of students who tore up their signs. The king did not see the confrontation.

Also on Thursday, Olav attended a ceremony at the statue of Leif Erikson at the Port of Seattle's Shilshole Bay Marina, greeted retirees at the Norse Home, watched sea otters at the Woodland Park Zoo, and ate lunch at the Space Needle. At the Norway Center, he listened to the Ballard High School Band and the Issaquah High School Chorus and said, "It is fine that you are able to keep these (Norwegian) traditions as a living thing ... and blend them as part of the American way of life" (*Post-Intelligencer*). That night the king attended a banquet in his honor at the Olympic Hotel.

On Friday, May 3, King Olav returned to the Cascade Mountains, making a trip to the Crystal Mountain ski area. He rode a chair lift to the resort's Summit House and admired the view of nearby Mount Rainier, where he had skied 29 years before. That evening he had a private dinner with family friends who lived in Bellevue. The next morning, Olav departed for Minneapolis.

King Olav made another visit to the Puget Sound region in 1975, celebrating the sesquicentennial of Norwegian immigration to America with a visit to Poulsbo, located in Kitsap County and nicknamed "Little Norway" for its large Norwegian American population.

Remark: *Guests at the head table at the civic banquet marking Boeing's first half century included, from left, William P. Woods of the civic committee and Mrs. Woods; C. L. Egtvedt, retired Boeing chairman and Mrs. Egtvedt; William M. Allen, Boeing president; Mrs. Juan J. Trippe, wife of the chairman of Pan American World Airways; Trippe, Mrs. William M. Allen; Gov. Daniel J. Evans, Mrs. J. D. Braman and Mayor Braman. Other head-table guests were not pictured. Guests were welcomed by the governor and the mayor.*

William McPherson Allen was born September 1, 1900, in Lolo, Montana. After earning a degree at the University of Montana, he enrolled at Harvard University where he earned a degree on law in 1925. In 1930, Allen joined the board of directors of Boeing Air Transport while being employed as an attorney with Donworth, Todd & Higgins, a Seattle law firm.

The unexpected death of Boeing president Philip G. Johnson in 1944 required that Boeing's chairman of the board, Claire Egtvedt, appoint a replacement. Egtvedt turned to Bill Allen, who initially refused to accept the position because he felt that he was unqualified to head the company. Allen, however, later accepted the position and served as the Chief Executive Officer (President) of The Boeing Company from September 1, 1945, to April 29, 1968. He then served as chairman of the company from 1968 to 1972.

Under William M. Allen's leadership, The Boeing Company launched the Boeing 367-80 (Dash 80), a jet-powered passenger airplane and the predecessor of the Boeing 707. Allen was also responsible for the development and launch of the Boeing 727, Boeing 737, and Boeing 747.

William M. Allen died on October 28, 1985. In 2003, an article published in **Fortune** ranked William McPherson Allen second among "*The 10 Greatest CEOs of All Time*," the top CEO being Charles Coffin, the founder of General Electric Company.

Dr. Roger Gerrard Breeze BVMS, Ph.D, MRCVS (10 October 1946 - 14 June 2016) was an English veterinary scientist who was an expert on bio-terrorism and a critic of mass culling to combat foot and mouth disease in animals.[1][2][3] [4]

Education

- Graduated from Manchester Grammar School
- Received his Bachelor of Veterinary Medicine and Surgery and a PhD in Veterinary Pathology from the University of Glasgow (1964-1973)

Career

- Was a member of the Royal College of Veterinary Surgeons
- Lecturer at The University of Glasgow School of Veterinary Medicine (1968-1977)
- Professor and chair of the Department of Microbiology and Pathology at Washington State University (1977-1987)
- **Deputy Director at the University of Washington Technology Center (1984-1987)**
- Director at [**Plum Island Animal Disease Center**] , USDA ARS (1987-1995)
- USDA Agricultural Research Service: Area Director (1995 – 1998) and Associate Administrator (1998-2004)
- CEO/Owner/President of the Centaur Science Group (2004-2015)
- Bio-Security Deputy Program Director at the Lawrence Livermore National Laboratory (2011-?)

Awards

Dr. Breeze received the Distinguished Executive Award from President Clinton in 1998 for his work at Plum Island and in biodefense.[5]

the size and orientation of the proteins involved, the matrix element is $T = 9 \pm 3 \times 10^{-4}$ eV. Using an approximate estimate (*1*)

$$T = \frac{2.7}{(N_d N_a)^{1/2}} \exp\left(-\frac{R}{1.4}\right) \quad (5)$$

T can be related to $N_d(N_a)$, the number of atoms over which the electron is delocalized on the donor (acceptor) molecule, and R, the distance between the heme groups on CP and C. For electronic wave functions delocalized over the heme groups, $N_d = N_a = 20$ and Eq. 5 gives the value $R \simeq 7$ Å. This is consistent with values predicted from the theory for other biological systems and similar to the value $R \simeq 7$ to 10 Å for C-Fe(CN)$_6$ (*3*). The distance between iron atoms is ~15 to 20 Å, similar to distances measured by fluorescence techniques (*8*).

The values of T and Δ obtained in these experiments are similar to those inferred in electron transfer processes in bacterial photosynthesis. Depending on which molecules are involved, the theory predicts values of T between 2×10^{-4} and 3×10^{-3} eV. Values of Δ between 0.4 and 1.6 eV are predicted for a series of electron transfers in bacterial photosynthesis. The CP-C value of $\Delta = 1.07$ eV is within this range.

The electron transfer rate, k, can be directly calculated from the parameters Δ, σ, and T (*1*). A value of $k \simeq 1 \times 10^{7 \pm 3}$ sec^{-1} is calculated for the measured parameters $E_d - E_a - \Delta = 0.70 \pm 0.22$ eV, $\sigma = 0.21 \pm 0.04$ eV, and $T = 9 \pm 3 \times 10^{-4}$ eV. The large error is due to the exponential behavior of the rate expression.

These results show the existence of a new charge-transfer band in the bound complex CP-C which is not present in the individual components. This new band and the parameters obtained are significant demonstrations of the validity of nonadiabatic electron tunneling.

Monensin and the Prevention of Tryptophan-Induced Acute Bovine Pulmonary Edema and Emphysema

Abstract. *3-Methylindole, a ruminal fermentation product of tryptophan, induces acute pulmonary edema and emphysema in cattle, and 3-methylindole is present in the ruminal fluid and blood of cows with a natually occurring form of this disease. Monensin, a polyether antibiotic and widely used feed additive for beef cattle, prevented tryptophan-induced acute bovine pulmonary edema and emphysema. Monensin acted by reducing the ruminal conversion of* L*-tryptophan to 3-methylindole both in vitro and in vivo. Lasalocid, also a polyether antibiotic, showed similar effects in vitro. These results provide a promising approach to prevention of this major respiratory disease of cattle.*

Acute bovine pulmonary edema and emphysema (ABPE) or fog fever is a naturally occurring disease of adult cattle characterized by sudden onset of acute respiratory distress soon after a change to lush forage, usually in the fall (*1*). The disease occurs in many parts of the world including the United States, Canada, and Europe (*1*, *2*), and it is the most prevalent respiratory disease associated with groups of pastured beef cattle (*3*). The incidence of ABPE appears to be increasing in parallel with changes to more intensive range and pasture management. This and the absence of proven methods of treatment or prophylaxis results in a significant economic loss to beef cattle producers. Effective prevention would allow more efficient utilization of improved pastures and provide economic benefits contributing toward more profitable red meat production.

Previously (*4*) we demonstrated that 3-methylindole, a ruminal fermentation product of tryptophan, would cause acute pulmonary lesions in cattle, similar to those of ABPE. Additional work has shown that the pathogenesis of the disease probably involves ruminal conversion of L-tryptophan, a naturally occurring amino acid and constituent of forage, to indoleacetic acid which is then converted to 3-methylindole (*5*, *6*). We have also found that ruminal microorganisms convert L-tryptophan to indoleacetic acid (*7*) and that a *Lactobacillus* sp. isolated from the rumen metabolizes indoleacetic acid to 3-methylindole (*8*). This process occurs in vivo, as indicated by the presence of 3-methylindole in ruminal fluid and plasma of cows given tryptophan to induce ABPE (*6*). In contrast to tryptophan or indoleacetic acid, both intravenous and oral administration of 3-methylindole results in pulmonary lesions typical of ABPE (*4*, *9*). In addition to the pathological similarity between the experimentally induced and naturally occurring diseases, the presence of 3-methylindole in ruminal fluid (*10*, *11*) and peripheral blood (*10*) has been demonstrated in cows that developed ABPE after a move from relatively dry to lush, green pasture. These observations lend support to the view that naturally occurring ABPE results from ruminal metabolism of tryptophan. In this report we describe experiments that demonstrate that monensin, a widely used feed additive, can inhibit the production of 3-methylindole and prevent experimentally induced ABPE. These results provide a promising approach to possible prevention of naturally occurring ABPE.

Previous work in our laboratory demonstrated that 3-methylindole production in ruminal fluid could be decreased in vitro and in vivo by the use of antibiotics (*7*), but the effectiveness of these antibiotics at concentrations low enough for practical application in live animals was not investigated. Therefore, we undertook experiments to screen several compounds for their ability to reduce 3-methylindole production. By means of in vitro techniques (*7*) and analytical methods devised in our laboratory (*12*), several antimetabolites were screened for their ability to reduce the conversion of L-tryptophan to 3-methylindole in vitro. Mixtures of 23 ml of ruminal fluid, 10 mg of L-tryptophan (10 mg of L-tryptophan per milliliter of H_2O), and 0.625 mg or 0.125 mg of test compound (25 or 5 μg per milliliter, final concentration) were incubated in triplicate in 50-ml Erlenmeyer flasks fitted with rubber caps. The test compounds were dissolved in 1 ml of H_2O, 0.1*N* aqueous NaOH, or absolute methanol. Each flask was flushed with CO_2 for 1 hour, then incubated at 37°C for another 23 hours. The results obtained were compared to those for control mixtures in which only solvent, substrate, and ruminal fluid were incubated. For these experiments we used ruminal fluid collected from one animal on several different days (at the same time each day), but comparisons between individual treatments and controls were always from the same ruminal fluid samples. Conversion of L-tryptophan to 3-methylindole in control mixtures averaged 43.7 percent. The results for mixtures incubated in vitro are shown in Table 1. The polyether antibiotics monensin and lasalocid (*13*) were the most effective compounds tested. At concentrations of 5 μg/ml, these compounds reduced 3-methylindole formation by 87 to 90 percent. The positive results with monensin were of particular interest because a commercial preparation of monensin is a widely used feed additive for beef cattle and might be a promising preventative for ABPE. Monensin increases production efficiency of cattle on pasture and reduces feed intake (*14*) by increasing the relative proportion of ruminal propionic acid production and possibly by decreasing methanogenesis and protein degradation (*15*). These effects may be complementary to those of reducing 3-methylindole formation and may allow a smoother transition from dry forage to lush pasture.

In subsequent studies we determined the ability of monensin to decrease ruminal production of 3-methylindole in vivo. Eight mature Hereford cows were divided into two groups and given 0.35 g of L-tryptophan per kilogram of body weight to induce ABPE. Each of four cows was given 100 mg of monensin (*16*) orally in gelatin capsules twice daily starting 1 day before and ending 4 days after the tryptophan dose. Four control cows were given L-tryptophan without further treatment. Ruminal fluid samples were taken at 0, 6, 12, 18, 24, 36, 48, 72, and 96 hours after tryptophan administration and analyzed for 3-methylindole (*12*). The cows were observed at least daily for clinical signs of respiratory disease, then examined at necropsy 6 days after the oral dose of tryptophan had been given.

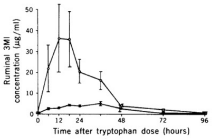

Fig. 1. Mean concentrations of 3-methylindole (*3MI*) in the rumens of four cows each given 200 mg of monensin per day, from −1 to 4 days after an oral dose of 0.35 g of L-tryptophan per kilogram of body weight (●), and in four cows given L-tryptophan without further treatment (○). Bars indicate ± standard error of the mean.

The mean concentrations of 3-methylindole in the rumen for each group of four cows are shown in Fig. 1. Mean ruminal concentrations of 3-methylindole in control cows reached a peak of 36.4 μg/ml at 12 hours and persisted at levels above 15 μg/ml from 6 to 36 hours after the cows received tryptophan. Mean concentrations in the rumen of monensin-treated cows never exceeded 5.0 μg/ml.

All control cows responded to tryptophan by developing clinical signs of respiratory disease, and three of the four cows were severely affected. One control cow died of ABPE approximately 132 hours after receiving tryptophan; two other control cows developed severe clinical signs of ABPE and were slaughtered in extremis, and the fourth control had mild clinical signs which had subsided by the time of slaughter. No clinical signs of respiratory disease were observed in any of the monensin-treated cows.

At necropsy, none of the monensin-treated animals had pulmonary lesions of tryptophan-induced ABPE. In contrast, diffuse lesions of congestion, edema, interstitial emphysema, alveolar epithelial hyperplasia of type 2 pneumonocytes, interstitial eosinophilia, and bronchiolar epithelial necrosis and hyperplasia were found in the lungs of the three cows with severe clinical signs. Similar focal lesions were detected microscopically in the fourth cow.

These experiments demonstrate that reduction in ruminal 3-methylindole formation prevents tryptophan-induced ABPE. Monensin and lasalocid, both polyether antibiotics, reduced 3-methylindole formation in vitro. Monensin was further shown to reduce 3-methylindole formation in vivo. These results provide a promising approach to a prevention for naturally occurring ABPE.

WSU professors, department chairman resign

Associated Press

PULLMAN — A department chairman and two professors at Washington State University are resigning because they say their wages are too low and there isn't enough support from top administrators.

Roger Breeze, chairman of WSU's veterinary, microbiology and pathology department, said he will resign June 30, and professors Denny Liggitt and Thomas Inzana say they'll take other jobs.

Breeze said he resigned because the top administrators are not adequately preparing for the future.

"I don't regard waiting for money to drop down from the Legislature to be a good strategic plan," he said.

The university's budget problems do not excuse administrators for their lack of support, Breeze said.

"I believe that budget problems are an integral part of a modern university's life, and they are not going to go away," he said. "Great universities, or universities that are getting better, pursue their strategic plans despite budget problems."

That could be accomplished if WSU was less rigid in its spending and promotion policies, he said.

WSU Provost Al Yates said WSU is attempting to adequately fund all programs.

"You have to look at things like trying to end the year with a balanced budget, like cutting $3 million in two successive years," Yates said. "When you're doing those kinds of things, how much discretion can you possibly have?"

Despite budget problems, Yates said WSU is committed to the veterinary, microbiology and pathology department, which has received national attention for its accomplishments in biotechnology and has been a leader in obtaining research grants.

Veterinary College Dean Robert Wilson said he believes administrators support all of the college's departments.

"The university has lacked the flexibility, but primarily because we've lacked the money to begin with," Wilson said. "The day that I feel the central administration isn't committed to developing the strongest college of veterinary medicine in the country will be the day that I'll be leaving."

Vet school's research day is Wednesday

Phi Zeta Research Day, an annual event in the Purdue University School of Veterinary Medicine, is Wednesday in Lynn Hall.

The all-day program, primarily for students and faculty of the school, is sponsored by Purdue's Omicron Chapter of the Society of Phi Zeta, the national honor society of veterinary medicine. Senior veterinary-medical students will serve as hosts of the free program.

Presenting the Phi Zeta Lecture this year will be Dr. Roger G. Breeze, director of the Plum Island Animal Disease Center in Greenport, N.Y. His talk, titled "Impact of Biotechnology on Veterinary Medicine," will be at 3 p.m. in Room 31 of Lynn Hall.

The students' research presentations will also be in Room 31. Undergraduates will compete from 1 p.m. to 1:25 p.m., vying for a $200 first prize and $100 second prize. Graduate competition will be from 1:25 p.m. to 2 p.m., with Beecham Laboratories, a national pharmaceutical firm, providing a $500 first prize.

From 2:20 p.m. to 2:50 p.m., faculty members receiving research support from the Department of Agriculture's Animal Health and Disease Research Fund will report on their research.

Also featured will be an all-day poster session.

Recipients of two new student-research fellowships sponsored by Abbott Laboratories and Ralston-Purina will be announced.

Forbidding Plum Island opens up

By ALIX BIEL
Courant Staff Writer

PLUM ISLAND, N.Y. — There's something forbidding about Plum Island. On a misty morning its sandy, sloping shores rise from Long Island Sound to barbed-wire fences surrounding stark, stone buildings.

In front of the desolation of crumbling military bunkers and scruffy shrubs stands the unmistakably unwelcoming sign: "U.S. Government Property. Closed to the Public. Landing Prohibited." Gulls circle above.

The Plum Island Animal Research Center has been cloaked in mystery since its opening 38 years ago by the U.S. Department of Agriculture. Scientists there have been accused of developing everything from biological warfare to Lyme disease.

In the year since a private company was hired to manage the installation, employees have complained that safety precautions have lapsed. So last week, for only the third time in the center's history, the director invited 17 reporters and photographers ashore in hopes of quashing fears and beginning a new chapter of openness.

"We don't have gnarled gnomes living around here," said Claude G. Crawford of Old Saybrook, deputy area director. "We have people with kids and families and homes who have a sincere concern about the livestock industry."

Still, anyone who steps ashore must have the explicit invitation of any of the scientists or technicians who work there. A former Army fort, the 850-acre island, named for

Island research center tries policy of openness

Continued from Connecticut page

the plum trees along its shores, is bordered by expansive views off shore. Connecticut's coast is 12 miles to the north, and Orient Point, N.Y., is 1.5 miles to the south.

No one lives on Plum Island, and the 200 to 220 people who work there are holed up most of the time in laboratories, studying deadly diseases. Layers of precautions — sanitary requirements and armed guards — prevent employees and visitors from taking diseases back to the Connecticut or New York mainlands. The diseases, found only in animals outside the United States, pose such a threat to domestic animal populations that Congress ordered they be studied offshore.

Blue jays and ospreys fly over the island, but no research animals can be seen. They are penned inside laboratory buildings. After an outbreak of foot and mouth disease in 1978, officials kept both healthy and infected animals indoors to prevent further outbreaks. Visitors can see the pigs, cows, sheep and other animals only through laboratory doors.

Research focuses on diseases that could cost billions of dollars if not contained and eradicated, scientists said. Although the diseases could be studied safely now at inland laboratories, when the Plum Island lab opened there were no such assurances. Hence, the congressional requirement that their study be buffered by a body of water.

Plum Island opened in 1954 to study and develop a vaccination against foot and mouth disease, a debilitating, contagious illness characterized by blistering around the feet and mouth of cattle, pigs, sheep, goats and a host of wild animals. About 40 percent of the research on the island today is focused on foot and mouth disease, which is no longer found in North America, said Roger G. Breeze of Cheshire, the director of the research program. Another 40 percent focuses on African swine fever, and the other 20 percent is concerned with a variety of other foreign animal diseases.

The Plum Island installation is divided into two parts: research and health inspection. The inspection service is responsible for testing plants and animal products being brought into the United States, training veterinarians to recognize foreign diseases and diagnosing those diseases.

The mission of both branches is "to protect animal industries and exports from economic losses caused by foreign animal diseases," Breeze said.

An outbreak of African swine fever in the United States could cost more than $2 billion in lost American pork sales, said Corrie C. Brown, head of the health inspection service's pathology section. An outbreak of foot and mouth disease could cost more than $20 billion in lost sales here and abroad, she said.

Not surprisingly, great precautions are taken to contain the foreign diseases. Samples headed to Plum Island from other countries are issued permits and specially packaged. Containers are wrapped in absorbent materials and placed in metal boxes designed to withstand three airplane crashes.

Scientists and technicians — and journalists — undergo extensive biosafety precautions. They strip naked and don hard hats, goggles, coveralls and sneakers before passing through a series of doorways that lead to the labs. Within the laboratory complex, areas are sealed off from each other. In some places, entry is allowed only

inants. Glasses worn into the lab areas are soaked in acidic solution. Hands and fingernails are scrubbed, and everyone spends at least three minutes in pulsating, hot showers, where they wash their bodies and their hair. Only then are lab workers allowed to leave each day.

Because of the sanitary precautions, the public is unwelcome; the big, black-lettered signs along the beach are clear on that point. Before last week, journalists had visited only twice — when the lab opened and after an outbreak of foot and mouth disease in 1978 when scientists wanted to assure the public that all was safe.

Officials explained the news blackout on the island as a throwback to the Cold War.

"It was a tit-for-tat philosophy," Crawford said; the Soviet Union kept the United States out of its labs so the United States wanted to prevent the Soviet Union from finding out what was happening in American labs.

The foreign menace has dissipat-

Burns and Roe Services Corp. of New Jersey took over in response to federal mandates that private corporations be hired if they can perform at a lower cost than the government can. The low bidder for the job, Burns and Roe, is the first private management company to run the installation. The company also runs several military bases overseas and has the janitorial contract for an Agriculture Department building in Washington.

Although many employees lost their federal jobs when Burns and Roe came in, most who did not retire were hired by the company, Crawford said; he knew of only one person who applied for a job with Burns and Roe and was turned down. He said many of the rehired employees took pay cuts and lost some of their benefits.

"We have had a lot of disruption to people's lives," Crawford said. "We have people who are unhappy."

Burns and Roe's first year has been rough in other ways as well, the director said. There have been a series of minor incidents — a Bunson burner left on, a radio missing from a biologically regulated area — that were reported to the FBI, the only enforcement agency with authority on the island.

Minor as separate events, the incidents developed into an unsettling trend.

"We don't know why these things are happening," Crawford said, adding that he could not rule out sabotage. But, he said, "I find it personally inconceivable that employees of Plum Island would do anything to sabotage the operations. . . . They may be unhappy, but they care about the island."

In general, most employees have continued to do "an outstanding job" while management works out difficulties in its first year, Crawford said. Burns and Roe will be managing the center for the next four years under its contract with the government.

Despite the difficulties, Crawford said, most of the employees on Plum Island have continued their work oblivious to the troubles.

"Whatever we do from a management standpoint, the people just go about doing their jobs, ignoring us," he said. "It's a matter of the management learning to live with one another."

Research building opens on island

By SAM LIBBY
Courant Correspondent

PLUM ISLAND, N.Y. — Scientists and government officials tried Friday to remove the veil of mystery that has long enveloped this beautiful, but forbidden 850-acre island in Eastern Long Island Sound.

About 120 animal disease scientists, veterinarians, former employees, utility officials and journalists attended a dedication ceremony for a new $15 million animal disease research building.

There is nothing secret or mysterious about the work that is done on Plum Island, said Dr. Roger Breeze, director of the Plum Island Animal Disease Center. The mission of the 40-year-old center is to protect America's food supply and to avoid the financial and public health devastation that would result if livestock diseases found in other parts of the world spread to North America, he said.

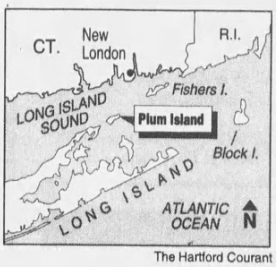
Since 1954, when the U.S. Department of Agriculture gained control of the island, it has been the restricted domain of livestock disease scientists and their test animals, who under controlled conditions have been exposed to the world's deadliest disease pathogens.

Thirty-five livestock diseases are being studied on the island. There is also a stockpile of hoof-and-mouth disease vaccine on the island to control any appearance of the disease in the United States, Mexico and Canada. The island gained notoriety in 1978 when there was an accidental release of hoof-and-mouth disease. That once devastating disease had not been present in the United States since 1929 at least partly as the result of work done on the island.

The disease spread to the island's test animals, said Charles Mebus, chief of the foreign animal diagnostic laboratory. The accident could have resulted in an international embargo on American livestock and livestock products, which could have cost American producers millions of dollars, he said. But because of the quick action of island scientists, that did not happen.

Mebus said Plum Island is the right place to have this kind of center. It is unlikely that any livestock disease pathogen would be able to leave the island. And prevailing winds would take pathogens to urban areas, where there is little agriculture, he said.

Although the island is forbidden except to authorized personnel, it is surrounded by some of Long Island Sound's best sport fishing areas. It is about 7 miles offshore from the Niantic section of East Lyme. The island is surrounded by coastal fortifications dating to World War I and World War II. It is covered by Asiatic bittersweet, a plant that has infested the island much as kudzu has spread over much of the Southeastern United States. The island has a long inviting strand of white sandy beach. Its skies are dominated by osprey.



The Hartford Courant

The work done on the island has added significance in light of the North American Free Trade Agreement, said R. Dean Plowman, acting assistant secretary of agriculture for science and education. In the global marketplace, livestock disease can quickly spread and cause sudden and severe devastation. Livestock disease can affect not only domesticated animals, but also wild animals and human health, he said.

Island of infection

Site guards viruses of cows, horses

By BOB GROVES
Staff Writer

— PLUM ISLAND, N.Y. Ever mindful of stray microbes, chief pathologist Corrie Brown led the way deep into the biocontainment area of Building 101.

She passed through a double-doored air lock — humid as a hothouse — and down several long, dimly lighted corridors that hummed with ventilation ducts and high-efficiency air filters. Huge compressors pumped air into the dreary spaces faster than it was exhausted, creating a "negative air pressure" to keep unseen contagion from escaping to the outside world.

Everyone who enters Building 101 of the Plum Island Animal Disease Center must follow a standard procedure. Visitors strip naked and don government-issue underwear, surgical scrub suits, and sneakers. They sign waivers and leave their wallets, watches, and other worldly possessions behind.

In the inner sanctum, Brown pulled open a heavy steel door to a cramped, windowless room that smelled of damp hay and large animal life.

No mythical Minotaur or man-bull mutant monster from H. G. Wells' "Island of Dr. Moreau," however, was tethered at the end of this labyrinth. Instead, there were four befuddled, white-faced Herefords waiting to be exposed to foot-and-mouth disease.

"Oh, you didn't brush this morning," Brown chided, prying open a cow's mouth to

See INFECTION Page A-5

INFECTION: Center protects, researches animal disease

From Page A-1

show off its teeth. Another cow mooed.

Brown was standing at the heart of the nation's only official "hot zone" for livestock, where animals are housed and studied, and their carcasses later incinerated.

"Foot-and-mouth is a highly contagious disease," said Brown, 44. "If you put a pig with FMD among 5,000 cows for one minute, within one week, every animal would have it.

"Controlling the spread of FMD is almost impossible" once an outbreak starts, she said.

Disease is a huge threat to the productivity and profit of the $50 billion American livestock business. Viruses such as FMD, though rarely fatal, leave animals sickly and unable to produce much meat or good milk. Anything that even looks like FMD can panic people who make their livelihood from livestock.

Unlike other parts of the world, the United States has been largely free of such diseases for more than 40 years, thanks to the vigilance of the U.S. Department of Agriculture, which operates the Plum Island facility.

Plum Island is a pork-chop-shaped islet two miles off the northeast tip of Long Island, reachable only by ferry. The Animal Disease Center is the federal facility for diagnosis and research of FMD, African swine fever, and more than three dozen other foreign viruses highly contagious to cows, pigs, and other cloven-hoofed animals.

The center keeps a repository of animal viruses and bacteria, stored in vials that are locked away in liquid nitrogen freezers, chilled to minus 70 degrees centigrade. About a third of them — including the anthrax virus and Venezuelan equine encephalitis — can be fatal to humans. Each year, the center ships hundreds of samples of these diseases to about 30 countries to test animals, tissue, and blood suspected of being infected. The center also maintains the North American Foot-and-Mouth Disease Vaccine Bank, containing 12 million doses.

About 35 of the 195 people who work at Plum Island are scientists. Another 60 are USDA animal caretakers, lab technicians, and librarians. The rest are employed by Burns and Roe Services Corp. of Oradell as firefighters, engineers, plumbers, carpenters, ferry pilots, and plant managers.

Since May, the center has been diagnosing cases of vesicular stomatitis (VS) from an outbreak occurring among cattle in five Western states. VS is a virus that mimics the symptoms of foot-and-mouth disease, such as lesions on the mouth, hoof, and teat. VS is less contagious than FMD, but it also makes the animal less productive and salable. VS was first identified more than 70 years ago in New Jersey, and samples are stored for reference on Plum Island.

To prevent potentially devastating diseases from crossing the border, 20,000 to 25,000 tests are performed each year on animals that are to be imported to the United States, and again when they enter the country. Samples of suspected cases of FMD are sent to Plum Island.

"We couldn't afford it if we missed one animal and caused an outbreak. It would be very costly. Our exports would drop by $20 billion for the year," Brown said.

Canadian economists, she said, estimated recently that a small outbreak of foot-and-mouth disease would cost their country $2 million to control quickly, but cause $2 billion in costly quarantines, trade embargoes, and damaged exports if left unchecked.

The guardians of New Jersey's own billion-dollar livestock business have relied on Plum Island in the past. "Their source of expertise is not available elsewhere," said Dr. Ernest Zirkle, director of the Division of Animal Health for the state Department of Agriculture.

The training that Zirkle and other veterinarians in the state received at Plum Island keeps them "on the cutting edge of being able to control animal disease," he said.

New Jersey has about 45,000 beef and dairy cattle, 65,000 horses, 20,000 pigs, and 3 million chickens and turkeys.

FMD flourishes mainly in South America, Asia, Africa, and Eastern Europe. The last outbreaks of FMD in North America were in the United States in 1929; in Canada in 1952 (caused by a farm worker who brought in contaminated sausage from Germany), and in Mexico in 1953.

In 1954, following these outbreaks on both borders, the USDA took over Fort Terry, a turn-of-the-century Army base on Plum Island.

Research animals — as well as tissue and fluid samples sent to Plum Island for diagnosis — are kept in what is classified as a "biological safety level 3-plus" agriculture zone inside Building 101. Level 3-plus viruses can be transmitted by air and are potentially lethal to other animals.

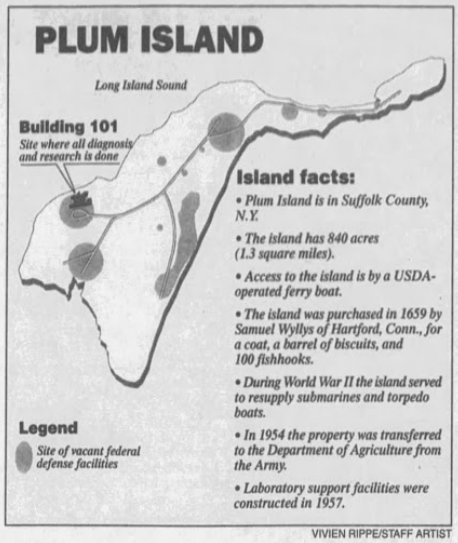
Anyone leaving the area must submit to mandatory showers, shampoos, and rigorous nail scrubbing; soak their eyeglasses in an acid bath; and agree to stay away from farm, zoo, and circus animals for a week. Reporters' notes are confiscated inside the area and faxed to them later to reduce risk of their carrying microbes out on paper and pens.

Isolation is key to the elaborate safety system for containing volatile viruses on the island, said Dr. Harley W. Moon, director of the center.

"If the first envelope fails, there's a second envelope and a third envelope. If something got out of the building, there's a whole series of things that have to happen" before a virus threatened the mainland, said Moon, 59. "That's the advantage of being on an island."

Another advantage, according to a report by former center director Roger G. Breeze, is that if an airborne virus were released accidentally from Plum Island, half of it would be dispersed over the Atlantic Ocean. The rest would spread to Long Island, which no longer has commercial herds of cattle and swine, and Connecticut, whose herds are diminishing.

Plum Island has no herds roaming on its 840 acres. Deer that occasionally swim out to the island to forage are shot and killed, Moon said.



VIVIEN RIPPE/STAFF ARTIST

In addition to diagnosis, Plum Island focuses on research. The facility takes credit for determining the genetic structure of and developing field tests and vaccines for numerous diseases, including FMD, African swine fever, African horse sickness, Venezuelan equine encephalitis, Japanese encephalitis of swine, and bluetongue.

In one of several microbiology labs, a man was peering at what looked like large X-ray transparencies. Dr. Peter Mason, a molecular biologist, was in fact reading audio-radiographic images of DNA material, mapping the entire gene sequence, or genome, of the FMD virus. Mason was studying mutant strains.

"There are hundreds of subtypes. Our goal is to use a mutant strain to produce a safe, synthetic vaccine," Mason explained.

"Viruses are able to mutate, and the new virus evolves selectively in the presence of an immune response. They mutate because they're sloppy. They're like frogs laying eggs — even if a lot of them don't hatch, they still get tadpoles," he said.

Moon is holding the fort between federal budget cuts on one flank and, on the other, increasing numbers of livestock being imported under new treaties, such as the North American Free Trade Agreement.

In 1994, according to Brown's figures, 2.5 million livestock, poultry, and zoological animals were imported, a number that increases by 10 percent each year. "Foot-and-mouth is still a threat, even though the technology to fight it is evolving. This is pretty much of an endless commitment," Moon said.

Moon has been monitoring recent outbreaks of deadly viruses in Australia that have been killing rabbits, horses, and even humans.

Scientists working in a lab similar to Plum Island off the southern coast of Australia experimented with calicivirus to exterminate wild rabbits, which overrun the country and are considered pests. When windblown insects spread the virus to the mainland and rabbits there began dropping by the thousands, Australians cheered, but Moon got worried.

"There's a potential for calicivirus to come to the United States," he said. "We're keeping a close eye on it. We don't want it here."

Moon also is following an Australian outbreak of morbillivirus, a mysterious hemorrhagic disease that has killed nearly two dozen horses and two handlers during the past year. "It's quite lethal," he said.

After decades of secrecy surrounding Plum Island, the USDA finally opened the center to the press and the public for the first time last year.

Until then, there had been wild rumors among Long Island locals about alleged secret government experiments out there involving germ warfare, AIDS-infected monkeys, Lyme disease, crashed UFO aliens, and genetically engineered, 6-foot-tall, two-headed, mutant chickens — all of them firmly denied by government officials.

Still, there are weird stories told by the scientists themselves, about the island's murky past, that would play well on television's "Unsolved Mysteries."

There is the tale of Thomas Gardiner, a sea captain and scion of the family that settled eastern Long Island. "Colonel Tom," who died of smallpox and was buried by relatives — fearing his infected remains — on Plum Island in 1839, is periodically sighted roaming laboratory basements at night when things are not going well.

Even after working there for 23 years, Doug Moore, a microbiologist, is susceptible to the mysterious aura of Plum Island.

"You'd almost expect it to be shrouded in fog . . . like the island in the remake of 'King Kong,' wouldn't you?" Moore said, making his daily morning ferryboat commute into Long Island Sound to study African swine fever.

Country Day at U.S.D.A stars agricultural research

By GEORGIA TASKER
Herald Staff Writer

The annual open house at Chapman Field, sponsored by the Council of Garden Club Presidents of Dade County and called Country Day at the U.S.D.A., is Saturday.

This year, visitors will find some changes and note some new ones on the way.

The 200-acre subtropical research station of the U.S Department of Agriculture is undergoing a transition. Some basic road work, building rehabilitation and field work are spiffing up the place, but much more is being evaluated for a master plan that will plot the station's future.

The research center's plants and trees, many kept as a living collection of germ plasm for agricultural use, are looking better than they have in years, says Steve Pearson, president of the Friends of Chapman Field.

The station's new director is Michael Hennessey, an entomologist who has been working on the staff.

Exhibits, music and food

Country Day includes narrated tours of the station discussing the research, planting programs and projects. The Garden Club Presidents will sponsor a junior flower show, education exhibits, plants, music and food.

The day also is set aside for the annual meeting of Friends of Chapman Field at 11 a.m. and election of new directors of that group.

The research center's plants and trees are looking better than they have in years, says Steve Pearson, president of the Friends of Chapman Field.

The friends came together two years ago as a group of plant scientists and professionals who wanted to help save the historic research site from being shut by Department of Agriculture budget cuts. Now, the organization has an official "memorandum of understanding" with the Agriculture Research Service (ARS), giving its volunteers "official status so we can help define projects" for the station, Pearson said.

"This is a tremendous milestone," Pearson said. "The agreement was modeled after that between the ARS and Friends of the National Arboretum in Washington, D.C. It also indicates that the ARS will be more receptive to the public."

Work of friends

The regional director of ARS, Roger Breeze, based in Athens, Ga., said the National Arboretum is run by the ARS and has half a million visitors a year. He believes Friends of Chapman Field should define similar projects locally. A primary role of the National Arboretum's friends is to raise money, since it is prohibited from doing so.

Pearson said the friends would like to see programs at the research station expanded to include not only tropical fruit, but "to restart its traditional work with ornamental plants."

At one time, the station introduced plants for landscape use and, after testing, made cuttings or seeds available to local nurseries.

Proposals discussed by plant groups in South Florida have included research on citrus tristeza virus, which can be devastating to the industry; suggestions from the Florida Nurserymen and Growers Association for research on environmentally safe ways to fight insect pests affecting ornamental crops; the use of some acreage to increase Fairchild Tropical Garden's collection of new mango varieties.

Breeze said, "We have a research program, but we also have a couple of hundred acres of unique plants, and one of the things we want to do is make sure people have access to them."

Breeze said he would visit South Florida in March to meet with the friends and listen to their proposals.

Admission to Saturday's event is free.

Chapman Field is at 13601 Old Cutler Rd. Country Day will take place from 10 a.m. to 4 p.m.

INTRODUCTION

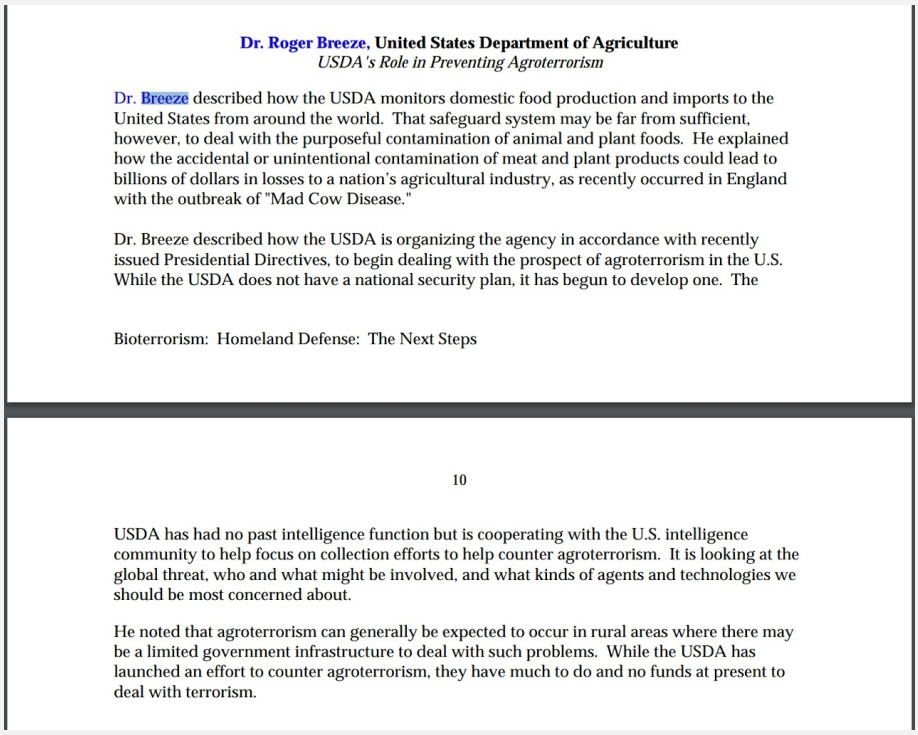
As noted in the Table of Contents, five separate panels were established to discuss the various components of a homeland defense against bioterrorism. A committee of sponsor representatives selected the panels and the subjects the panel speakers were to address. The selection of the panel speakers, however, was left primarily to the discretion of the panel chairpersons. In some instances, modifications to the subjects covered by the panels were made by the panel chairpersons. Thus, it will be noted that some of the panel presentations are broader in content and go beyond the subject that the panel was originally intended to cover. It was recognized by the Symposium sponsors that there were many important homeland defense-related issues, some noted here and others in the full transcript on the RAND web site, that we were not able to address either for lack of time or availability of an appropriate government or civilian expert.

An objective of the Symposium was to bring together federal, state, and county officials and experts from the private sector to focus on homeland defenses against bioterrorism as may be needed in Los Angeles County. It is recognized that for any such defenses to be effective, they must be coordinated between relevant agencies within each level of government. The speakers and the participants selected for the Symposium, thus, represent a variety of agencies at all levels of government. (See the RAND web site for a listing of the participants.)

The summaries of the Symposium presentations published here were prepared by the editors with the intention of capturing the essence of the more important issues raised in the original presentations. A complete edited transcript of each talk can be found on the RAND web site.

* Complete transcripts of each talk are being placed on the RAND web site as they are received after editing from each speaker.

Bioterrorism: Homeland Defense: The Next Steps



Dr. Roger Breeze, United States Department of Agriculture
USDA's Role in Preventing Agroterrorism

Dr. Breeze described how the USDA monitors domestic food production and imports to the United States from around the world. That safeguard system may be far from sufficient, however, to deal with the purposeful contamination of animal and plant foods. He explained how the accidental or unintentional contamination of meat and plant products could lead to billions of dollars in losses to a nation's agricultural industry, as recently occurred in England with the outbreak of "Mad Cow Disease."

Dr. Breeze described how the USDA is organizing the agency in accordance with recently issued Presidential Directives, to begin dealing with the prospect of agroterrorism in the U.S. While the USDA does not have a national security plan, it has begun to develop one. The

Bioterrorism: Homeland Defense: The Next Steps

10

USDA has had no past intelligence function but is cooperating with the U.S. intelligence community to help focus on collection efforts to help counter agroterrorism. It is looking at the global threat, who and what might be involved, and what kinds of agents and technologies we should be most concerned about.

He noted that agroterrorism can generally be expected to occur in rural areas where there may be a limited government infrastructure to deal with such problems. While the USDA has launched an effort to counter agroterrorism, they have much to do and no funds at present to deal with terrorism.

Feds urge food security

Scripps Howard News Service

NEW ORLEANS — The FBI and federal agencies overseeing food safety issues are urging America's food manufacturers and processors to impose new farm-to-restaurant security procedures to thwart attacks by bioterrorists that could cripple the nation's food supply.

"The food supply is an obvious target — we all have to eat," said LeeAnne Jackson of the U.S. Food and Drug Administration's center for food safety and nutrition. "We need to raise the attention of the food industry to the possibility of terrorism."

She said information on spreading plant and animal diseases is already available on the Internet, including one "how-to" underground publication, "Silent Death," by the pseudonymous Uncle Fester, which once was a best-seller on Amazon.com.

But Jackson said potential terrorists don't need to go to the effort of making biological weapons because there's an ample supply of deadly cultures and viruses in often badly secured academic research laboratories that could also be stolen and used to spread diseases.

"Why we are concerned about food is that it has already occurred," she said, recalling the 1984 incident in The Dalles, Ore., when followers of the Bhagwan Shree Rajneesh spread salmonella on a salad bar, poisoning 750 people. More recently, 27 people at LaValle University in Quebec were sickened last year after arsenic was put in the veterinary laboratory's coffee machine.

Craig Watz, director of the FBI's center for biological terrorism in Washington, told the Institute of Food Technologists convention meeting here this week that the current assessment of likely future terrorist attacks in the United States involves bombs and guns because they have more predictable effects.

But he told the industry that there are already worrying signs biological weapons are appearing more often in anthrax hoaxes and extortion attempts using threats of poisoning food. He said his office now handles 200 to 250 cases a year of possible biological terrorism, most of which turn out to be hoaxes.

"The biological arena is unpredictable," and terrorists could switch to spreading animal or plant diseases to undermine public confidence in the $18 billion food industry, and attempt to ruin America's economy.

Scott Brooks, head of food safety for the Taco Bell restaurant chain, said there are simple security steps the industry can take to make terrorist attacks more difficult, from closing their processing plants to outsiders, to more closely checking everything that comes into their facilities.

Roger Breeze, head of special research programs at the U.S. Agriculture Department's Agricultural Research Service, said Americans have been lulled into a sense of security because the two oceans have prevented serious animal disease epidemics in the United States.

Breeze said that shouldn't make the food industry complacent to what might happen if someone deliberately infected animals.

STATE & NATION

'WE ALL HAVE TO EAT'

Experts warn of the next terror target: food supply

Nation vulnerable to deliberate spread of bacteria, viruses

By LANCE GAY
Scripps Howard News

NEW ORLEANS — The FBI and federal agencies overseeing food safety issues are urging America's food manufacturers and processors to impose new farm-to-restaurant security procedures to thwart attacks by bioterrorists that could cripple the nation's food supply.

"The food supply is an obvious target — we all have to eat," said LeeAnne Jackson of the U.S. Food and Drug Administration's center for food safety and nutrition. "We need to raise the attention of the food industry to the possibility of terrorism."

She said information on spreading plant and animal diseases is already available on the Internet, including one "how-to" underground publication, "Silent Death," by the pseudonymous Uncle Fester, which once was a best-seller on Amazon.com.

But Jackson said potential terrorists don't need to go to the effort of making biological weapons because there's an ample supply of deadly cultures and viruses in often badly secured academic research laboratories that could also be stolen and used to spread diseases.

"Why we are concerned about food is that it has already occurred," she said, recalling the 1984 incident in The Dalles, Ore., when followers of the Bhagwan Shree Rajneesh spread salmonella on a salad bar, poisoning 750 people. More recently, 27 people at LaValle University in Quebec were sickened last year after arsenic was put in the veterinary laboratory's coffee machine.

Predictable: Craig Watz, director of the FBI's center for biological terrorism in Washington, told the Institute of Food Technologists convention meeting here this week that the current assessment of likely future terrorist attacks in the United States involves bombs and guns because they have more predictable effects.

But he told the industry that there are already worrying signs biological weapons are appearing more often in anthrax hoaxes and extortion attempts using threats of poisoning food. He said his office now handles 200 to 250 cases a year of possible biological terrorism, most of which turn out to be hoaxes.

"The biological arena is unpredictable," and terrorists could switch to spreading animal or plant diseases to undermine public confidence in the $18 billion food industry, and attempt to ruin America's economy. "The public panic is the goal," he said.

Scott Brooks, head of food safety for the Taco Bell restaurant chain, said there are simple security steps the industry can take to make terrorist attacks more difficult, from closing their processing plants to outsiders, to more closely checking everything that comes into their facilities.

"The weak underbelly is our food and water supplies," said Brooks, who formerly worked on a Pentagon program to secure the food supply for U.S. Air Force bases in the Middle East.

Sense of security: Roger Breeze, head of special research programs at the U.S. Agriculture Department's Agricultural Research Service, said Americans have been lulled into a sense of security because the two oceans have kept serious animal disease epidemics from coming to the United States.

Breeze said that shouldn't make the food industry complacent to what might happen if someone deliberately infected animals with a foreign disease. He noted England's beef and sheep industry has been devastated by a foot-and-mouth disease outbreak that brought agricultural shipments to a halt and resulted in killing more than 4.5 million head of livestock. The United States has more than 200 million cattle, hogs and sheep that would be vulnerable if the outbreak spread here.

"There are vulnerabilities" in the U.S. food supply chain, he said. "What we're doing here is trying to anticipate something will happen in the future."

Agriculture Department inspector general Roger Viadero said his office is also asking Congress this year to increase penalties for smuggling prohibited agricultural products into the United States.

He said he wasn't aiming at individuals who bring prohibited fruit or meat into the United States, but organized smuggling that could import exotic fruit flies that would devastate fruit farms from California's Central Valley to Georgia.

Many of nation's farms step up security

Bioattack could be devastating to economy

BY CHARLES PILLER
Los Angeles Times

GREELEY, Colo. — The teeming Swift & Co. slaughterhouse on the edge of town has the feel of a military base lately. Security cars cruise the fenced compound, and periodic drills are run to prepare for any attack.

At the Wayne Farms poultry plant in Decatur, Ala., armed guards patrol the grounds, searching for any threat to the tens of thousands of chickens.

In Porterville, Calif., dairy farmer Tom Barcellos recently installed video cameras in his milking barns to keep watch over his 1,200 cows.

Nothing seems farther from the front lines of terror than the vast American hinterlands, yet since the Sept. 11, 2001, attacks they have been drawn into the amorphous battle.

The threat is agroterrorism — the use of microbes and poisons to shake confidence in the U.S. food supply and devastate the $201 billion farm economy.

Diseases such as swine fever or citrus greening disease can spread across the land silently. A single outbreak of foot-and-mouth disease could require the destruction of millions of cows and result in a worldwide ban on U.S. cattle exports for years.

"The animal becomes a weapon," said Peter Chalk, an agroterrorism expert with the Rand Corp., a Santa Monica, Calif.-based think tank.

Unlike the most feared bioterrorism threats, such as smallpox and anthrax, some virulent agricultural diseases are harmless to humans. The diseases can be obtained from infected crops and animals worldwide.

No known intelligence has linked terrorists to attempts to compromise the food supply, according to federal officials, but concerns were sparked after investigators discovered that the Sept. 11 hijackers had explored the use of crop dusters. Last year, Sen. Susan Collins, R-Maine, chairwoman of the Governmental Affairs Committee, said U.S. forces found "hundreds of pages of U.S. agricultural documents" in caves in Afghanistan once occupied by al-Qaida militants.

"The expertise needed to mount a serious attack is quite small," said University of California-Davis microbiologist Mark Wheelis. "The amount of material needed — you could hold it in a ballpoint pen."

The Department of Agriculture is building or modernizing two dozen laboratories to quickly screen disease samples from around the United States. It has created SWAT teams of plant and animal pathologists in each region to respond to outbreaks and proposes to spend $381 million on biodefense in 2005.

"Naturally, when there's never been a Noah-like flood, people don't want to prepare for it."
ROGER BREEZE | agroterrorism expert

"We're looking at what changes are needed," said Jeremy Stump, the USDA's domestic security director, whose office is dedicated to the agroterrorism threat. "We may need to harden targets."

Yet the efficiencies of the very productive farm system — vast tracts of single-crop fields and factory farms that crowd thousands of animals in tightly packed pens — make security in agriculture difficult.

"Naturally, when there's never been a Noah-like flood, people don't want to prepare for it," said Roger Breeze, an agroterrorism expert who recently retired from a top USDA post.

There have been several natural outbreaks of animal disease that bolster a wide view of the threat's scope. In December in Washington state, a single case of bovine spongiform encephalopathy — mad cow disease — shut down most U.S. beef exports for months. Some nations still refuse U.S. cattle.

Three million chickens were killed in 2002 as Newcastle disease swept through Southern California.

If a foot-and-mouth attack occurs, it might start at a place like Swift's Gilcrest feedlot, south of Greeley. It is a small city of cows — about 80,000 packed in pens.

Gates block entrances. Cameras and guards keep watch. Yet, unlike Swift's fortresslike slaughterhouse, Gilcrest seems an easy target for an attacker lofting a bag of infected feed over the fence from nearby County Road 31. Within a 10-mile radius are nearly a half million cattle, said Bob Rolston, past president of the Colorado Livestock Association.

The primary concern of most farmers and ranchers is a natural outbreak. "One catastrophic disease outbreak and 15 years of market development is down the drain," said Mark Gustafson, a senior vice president at Swift.

But the Sept. 11 attacks added another layer of worry. More surveillance cameras have been installed in Swift's feedlots. At the slaughterhouse in Greeley, every employee is searched before entering the plant through a tunnel accessible only from a guardhouse, said Jim Herlihy, a company spokesman.

Such measures, however, seem minimal given the vast territory that must be protected against an attack or, more likely, a natural outbreak.

The industry has turned to advanced technology for reassurance. But just like bioterrorism that targets people, each precaution would only limit rather than deter an attack.

Breeze and Wheelis advocate greater use of vaccines, but that approach is fraught with problems — high cost and logistical complexity among them.

Foot-and-mouth comes in more than a dozen strains, each of which requires a separate vaccine. Many nations cannot readily distinguish between infected and vaccinated animals and would reject either at their border.

Cepheid Corp. and Idaho Technology market suitcase-size devices that they call a first line of defense against agroterrorism. Originally designed as mobile sensors to protect people against bioterrorism, the sensitive instruments sniff the air to determine the presence of a deadly microbe within half an hour. Such devices helped map Southern California's Newcastle outbreak.

Scientists are experimenting with portable units at poultry farms and dairies. But the scale of the problem is too big for such solutions. Each device costs at least $30,000, and thousands would be needed.

COVERING THE BETTER PART OF KANSAS

THE HUTCHINSON NEWS

SATURDAY, APRIL 12, 2008 50 CENTS

Foot-and-mouth lab considers Kan.

■ Feds admit to previous accidents at research facility for illness fatal to livestock.

By Larry Margasak
Associated Press Writer

WASHINGTON - The only U.S. facility allowed to research the highly contagious foot-and-mouth disease experienced several accidents with the feared virus, the Bush administration acknowledged Friday.

A 1978 release of the virus into cattle holding pens on Plum Island, N.Y., triggered new safety procedures. While that incident was previously known, the Homeland Security Department told a House committee there were other accidents inside the government's laboratory.

The accidents are significant because the administration is likely to move foot-and-mouth research from the remote island to one of five sites on the U.S. mainland near livestock herds. This has raised concerns about the risks of a catastrophic outbreak of the disease, which does not sicken humans but can devastate the livestock industry.

Skeptical Democratic leaders of the House Energy and Commerce Committee demanded to see internal documents from the administration that they believe highlight the risks and consequences of moving the research. The live virus has been confined to Plum Island for more than a half-century to keep it far from livestock.

The 1978 accidental release "resulted in the FMD virus in some of the cattle in holding pens outside the laboratory facility," Jay Cohen, a senior Homeland Security official,

See LAB / A9

Lab

●Continued from Page A1

wrote in response to the committee.

"Detailed precautions were taken immediately to prevent the spread of the disease from Plum Island, and new precautionary procedures were introduced."

Cohen, undersecretary for science and technology, said there also have been "in-laboratory incidents" - contamination of foot-and-mouth virus within the facility but not outside it - at Plum Island since 1954. That was the year the Agriculture Department acquired the land and started the Plum Island Animal Disease Center.

One government report, produced last year and already provided to lawmakers by the Homeland Security Department, combined commercial satellite images and federal farm data to show the proximity to livestock herds of locations that have been considered for the new lab.

"Would an accidental laboratory release at these locations have the potential to affect nearby livestock?" asked the nine-page document. It did not directly answer the question.

'Full-court press'

A simulated outbreak of the disease in 2002 - part of an earlier U.S. government exercise called "Crimson Sky" - ended with fictional riots in the streets after the simulation's National Guardsmen were ordered to kill tens of millions of farm animals, so many that troops ran out of bullets. In the exercise, the government said it would have been forced to dig a ditch in Kansas 25 miles long to bury carcasses. In the simulation, protests broke out in some cities amid food shortages.

"It was a mess," said Sen. Pat Roberts, R-Kan., who portrayed the president in that 2002 exercise.

"Devastating results happened; utter chaos - loss of markets, the herds had to be destroyed, people panicked in urban areas," Roberts said during a 2008 Senate hearing.

Now, like other lawmakers from the states under consideration, Roberts supports moving the government's new lab to his state. Manhattan, Kan., is one of five mainland locations under consideration. "It will mean jobs" and spur research and development, he says.

In its quest to win the $450 million facility, Kansas officials have launched what Gov. Kathleen Sebelius calls a "full-court press" to convince the government that Kansas is the best location. Sebelius created a task force to lobby for the lab and last month the state authorized $105 million in bonds to buy land, upgrade roads and build a utility plant for the lab at the proposed site on the Kansas State University campus.

Other possible locations for the new National Bio- and Agro-Defense Facility are Athens, Ga.; Butner, N.C.; San Antonio; and Flora, Miss. The new site could be selected later this year, and the lab would open by 2014. The number of livestock in the counties and surrounding areas of the finalists range from 542,907 in Kansas to 132,900 in Georgia, according to the Homeland Security Department's internal study.

Foot-and-mouth virus can be carried on a worker's breath or clothes, or vehicles leaving a lab, and is so contagious it has been confined to Plum Island since the research began. The existing lab is 100 miles northeast of New York City in the Long Island Sound. Researchers there who work with the live virus are not permitted to own animals at home that would be susceptible, and they must wait at least one week after work before attending outside events where such animals might perform, such as a circus.

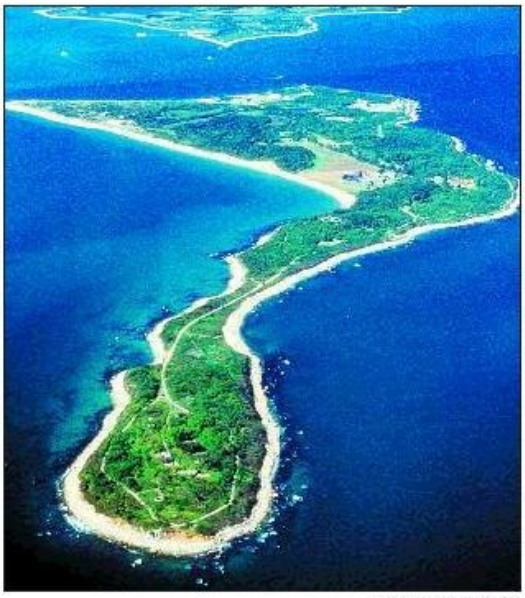
Leaders of the House Energy and Commerce Committee also are worried about the lab's likely move to the mainland. Chairman John Dingell, D-Mich., and the head of the investigations subcommittee, Rep. Bart Stupak, D-Mich., also demanded reports about "Crimson Sky" and other studies on the consequences of live virus research on the U.S. mainland. Cohen, the Homeland Security official, said those documents were provided.

Two lawmakers from New York, Sen. Hillary Rodham Clinton and Rep. Timothy Bishop, both Democrats, expressed concerns in letters they wrote last year about the Homeland Security Department's ability to protect the existing lab at Plum Island, which relies for security on a private security company and local police rather than federal agents.

"We are particularly concerned that DHS has not been meeting the security needs of the facility since Federal Protective Service agents were removed from the island," Clinton and Bishop wrote in a letter obtained by The Associated Press.

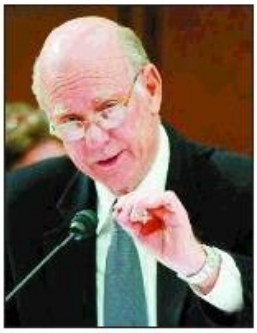
Cohen responded that Plum Island used a contract with a private security firm and relied on an agreement with local police, who were deputized to enforce federal laws on the island.

Will Jenkins, Bishop's spokesman, said Friday that Homeland Security "has been responsive to the concerns raised last year, and Congressman Bishop is pleased with the progress DHS is making regarding security for Plum Island."



Photos by The Associated Press

Plum Island, off the northern shore of Long Island, N.Y., is home to the Plum Island Animal Disease Center, where scientists study some of the world's most infectious animal viruses.



Sen. Pat Roberts, R-Kan., portrayed the president in the 2002 "Crimson Sky" exercise – a simulated outbreak of foot-and-mouth disease. The exercise ended with riots in the streets after fictional National Guardsmen were ordered to kill tens of millions of farm animals, so many that troops ran out of bullets. "It was a mess," he said.

Security questions

The White House said modern safety rules at labs are sufficient to avoid any outbreak. But incidents in Britain have demonstrated that the foot-and-mouth virus can cause remarkable economic havoc - and that the virus can escape from a facility.

An epidemic in 2001 devastated Britain's livestock industry, as the government slaughtered 6 million sheep, cows and pigs. Last year, in a less serious outbreak, Britain's health and safety agency concluded that the virus probably escaped from a site shared by a government research center and a vaccine maker. Other outbreaks have occurred in Taiwan in 1997 and in China last year and in 2006.

If even a single cow signals an outbreak in the United States, emergency plans permit the government to shut down all exports and movement of livestock. Herds would be quarantined, and a controlled slaughter could be started to stop the disease from spreading.

Infected animals weaken and lose weight. Milk cows don't produce milk. They remain highly infectious, even if they survive the virus.

The Homeland Security Department is convinced it can safely operate the lab on the mainland, saying containment procedures at high-security labs have improved. The livestock industry is divided. Some experts, including the former director at the aging Plum Island lab, say research ought to be kept away from cattle populations - and, ideally placed where the public already has accepted dangerous research.

The former director, Dr. Roger Breeze, suggested the facility could be safely located at the Atlanta campus of the Centers for Disease Control and Prevention, or at Fort Detrick in Frederick, Md., home of The United States Army Medical Research Institute for infectious diseases.

Another possibility, Breeze said, is on Long Island, where there is no commercial livestock industry. That would allow retention of most of the current Plum Island employees.

The former head of the Agriculture Department's Agricultural Research Service said Americans are not prepared for a foot-and-mouth outbreak that has been avoided on the mainland since 1929.

"The horrific prospect of exterminating potentially millions of animals is not something this country's ready for," said Dr. Floyd Horn.

The Agriculture Department ran the Plum Island lab until 2003. It was turned over to the Homeland Security Department because preventing an outbreak is now part of the nation's biological defense program.

Plum Island researchers work on detecting the disease, controlling epidemics using vaccines and drugs, testing imported animals and training professionals.

The new facility will add research on diseases that can be transferred from animals to humans. The Plum Island facility is not secure enough to handle that higher-level research.

A new facility at Plum Island is technically a possibility. Signs point to a mainland site, however, after the administration spent considerable time and money scouting new locations. Also, there are financial concerns about operating from a location accessible only by ferry or helicopter.

The Homeland Security Department said laboratory animals would not be corralled outside the new facility, and they would not come into contact with local livestock. All work with the virus and lab waste would be handled securely and any material leaving would be treated and monitored to ensure it was sterilized.

"Containment technology has improved dramatically since foot-and-mouth disease prohibitions were put in place in 1948," said Homeland Security spokeswoman Amy Kudwa.

Sequence-Based Classification of Select Agents A B R I G H T E R L I N E Committee on Scientific Milestones for the Development of a Gene Sequence-Based Classification System for the Oversight of Select Agents Board on Life Sciences Division on Earth and Life Studies

Copyright 2010 by the National Academies. All rights reserved. Printed in the United States of America.

Preface Recent studies by the National Research Council have focused on the tension between the rapid advances in biotechnology that clearly benefit humankind and the potential use of the same advances for nefarious purposes. The 2004 report, Biotechnology Research in an Age of Terrorism helped to focus attention on the issue, and among other recommendations called for the creation of a National Science Advisory Board for Biodefense (NSABB) to serve as a bridge between the government and scientific communities in raising awareness of the potential for misuse of biotechnology. A later report, Globalization, Biosecurity, and the Future of the Life Sciences carried the discussion forward with a global perspective and promoted a global common culture of awareness and a shared sense of responsibility among life scientists. In 2006, the NSABB issued Addressing Biosecurity Concerns Related to the Synthesis of Select Agents, which called for expert evaluation to determine whether an alternative framework based on predicted features and properties encoded by nucleic acids, such as virulence or pathogenicity, can be developed and used in lieu of the current finite list of specific agents and taxonomic definitions. Our committee was tasked with identifying “the scientific advances that would be necessary to permit serious consideration of developing and implementing an oversight system for Select Agents that is based on predicted features and properties encoded by nucleic acids rather than a relatively static list of specific agents and taxonomic definitions.” Our committee was populated with persons who had expertise in several complementary fields. The amalgamation of scientific backgrounds allowed us to address our task from different viewpoints and to assess the potential impact of our recommendations on various sectors. We benefited by having committee members who were experts in human and animal health and leaders in the

development of policy relevant to these fields; leaders in fundamental structural, evolutionary, and computational biology and bioinformatics; scientists dedicated to the study of pathogenic viruses and bacteria; and experts from the commercial biotechnology sector. Many committee members were personally involved either directly or indirectly in research on plant or animal pathogens designated as Select Agents and thus had first-hand experience in dealing with the relevant regulations and security requirements implemented in recent years to reduce the risk of misuse. We were especially fortunate to have a senior scientist and executive in the biotechnology industry who was able to offer a unique perspective on the role of industry in implementation of current and future steps that might be taken to reduce the risk of misuse of synthetic biology. We were informed by the shared expertise of many professionals in synthetic biology, security, public health, human and animal medicine, the life sciences, informatics and several other relevant fields as we grappled with our challenging task. Specifically, Julia Kiehlbauch, Robbin Weyant, Claudia Mickelson, Edward You, and Amy Patterson helped us to understand the current structure for oversight of Select Agents. Peter Pesenti, John Mulligan, Marcus Graf, Claes Gustafsson and Stephen Maurer discussed with us the current mechanisms and criteria for screening and surveillance at the sequence level. Stanley Falkow, Jeffrey Taubenberger, Michael Katze, Ralph Baric and Ramon Felciano discussed virulence; and Sean Eddy, Jonathan Eisen, Elliot Lefkowitz, John Moult and Ian Lipkin addressed gaps, challenges and potential milestones in predicting pathogenicity from sequence information. In addition, Carol Linden, Arturo Casadevall, David Relman, Mary Groesch, Jacqueline Corrigan-Curay and James Blaine all met personally with our committee and joined in our discussions. We sincerely thank all those who took time from their busy schedules to meet with us, answer our questions, and guide us in our deliberations. Early in our discussions, it became apparent that the criteria historically used to designate a pathogen as a Select Agent included characteristics that cannot be determined by sequence alone and therefore cannot be predicted with the degree of certainty required for regulatory purposes. We soon concluded that a sequence-based prediction system for oversight of Select Agents is not now possible, nor is it likely to be feasible in the foreseeable future. We did, however, recognize that a sequence-based classification system for Select Agents focused on consideration of sequences of concern could be developed and might help to clarify taxonomic distinctions among recognized Select Agents. By focusing on “sequences of concern” and coupling that with a cautionary alert (a “yellow flag system”), one might effectively address both biosecurity and biosafety goals. Near-term milestone and long-term research objectives were defined and are discussed in our report. Throughout our deliberations, we continually tried to balance the need for safety and security, while recognizing the challenges of potential dual-use applications that arise as the scientific

community improves its understanding of the genomic basis that leads one organism to be pathogenic, while its near neighbor is not. We were also concerned about the potential burden that such an oversight program might have on the day-to-day conduct of science and the biotechnology business sector, and about the opportunities that might be missed. We concluded that a gene sequence-based classification system could be developed. We did not, however, address whether such as system should be developed or whether the additional administrative structure needed to maintain such a system would be justified. Therefore, we do not specifically recommend that either the classification or yellow flag system be implemented. Rather, we provide information about what is technologically feasible, and emphasize that the potential benefits of such a system should be considered and weighed against the cost and complexity of implementation. **The Nobel laureate Joshua Lederberg was quoted in Richard Preston's 1998 article on bioweaponeers in The New Yorker as saying: "There is no technical solution to the problem of biological weapons. It needs an ethical, human, and moral solution if it's going to happen at all. Don't ask me what the odds are for an ethical solution, but there is no other solution. But would an ethical solution appeal to a sociopath? (Preston 1998)"** We find ourselves today, more than a decade later, still searching for a technical solution to a challenge that has grown beyond biological warfare and now encompasses the threat of bioterrorism as well; a challenge that is ever more complex and threatening as biotechnology advances and access to it expands. We can attempt to harness technology to lessen risks, but we would be wise to heed Lederberg's advice to couple this with efforts toward an "ethical, human and moral solution." The committee wishes to express its sincere thanks and appreciation to India Hook-Barnard, our study director and program officer, for her leadership, guidance and expertise, coupled with good nature and charming personality. We benefited greatly from her dedication and creativity throughout the study. She was ably assisted by Carl-Gustav Anderson, senior program assistant, who ensured that our every need was met during our meetings and conference calls and worked diligently to coordinate schedules in what must have been a nearly impossible task. Our project was expertly guided by Fran Sharples as the director of the Board on Life Sciences. Finally, on a personal note, I would like to express my sincere appreciation to the members of the committee, who generously donated their time and knowledge to make this project both extremely productive and very enjoyable. Our discussions were frank, open, and honest, and they benefited greatly from the diversity of our backgrounds and our complementary experiences. We were indeed more than the sum of our own individual contributions. It has been my pleasure and privilege to work with each of you. James W. Le Duc, Chair

[...]

Dr. Roger G. Breeze received his veterinary degree in 1968 and his PhD in veterinary pathology in 1973, both from the University of Glasgow, Scotland. He was engaged in teaching, diagnostic pathology, and research on respiratory and cardiovascular diseases at the University of Glasgow Veterinary School from 1968 to 1977 and at Washington State University College of Veterinary Medicine from 1977 to 1987, where he was professor and chair of the Department of Microbiology and Pathology. **From 1984 to 1987, he was deputy director of the Washington Technology Center, the state's high-technology sciences initiative, based in the College of Engineering of the University of Washington.** In 1987, he was appointed director of the U.S. Department of Agriculture (USDA) Plum Island Animal Disease Center, a Biosafety Level 3 facility for research and diagnosis related to the world's most dangerous livestock diseases. In that role, he initiated research on the genomic and functional genomic basis of disease pathogenesis, diagnosis, and control of livestock RNA and DNA virus infections. That work became the basis of U.S. defense against natural and deliberate infection with those and led to his involvement in the early 1990s in biologic-weapons defense and proliferation prevention. From 1995 to 1998, Dr. Breeze directed research programs in 20 laboratories in the Southeast for the USDA Agricultural Research Service before going to Washington, D.C., to establish biologic-weapons defense research programs for USDA. He received the Distinguished Executive Award from President Clinton in 1998 for his work at Plum Island and in biodefense. Since 2004, he has been chief executive officer of Centaur Science Group, which provides consulting services in biodefense. His main commitment is to the Defense Threat Reduction Agency's Biological Weapons Proliferation Prevention Program in Europe, the Caucasus, and Central Asia.

BUT A QUIET REVOLUTION WAS UNDER WAY IN AN OBSCURE SECTOR known as "advanced technology." Almost unnoticed, state high-tech employment increased 28 percent during those tough four years.

In an industrial economy accustomed to lumber mills and copper smelters, high technology had long meant **Boeing's missiles, radar systems and jet aircraf**t. Otherwise, high tech happened someplace else.

It was just as well, noted some locals, because technology was heartless. Computerized robots would only force more workers to join out-of-work loggers and fishermen. And what would they all do? Become computer programmers?

In 1980, The Times regarded high technology with considerable skepticism. A year later, as the term "high tech" was entering standard newspaper usage, The Times noted a number of small, local companies with promising futures. "Some may grow to become household words, others may die on the vine," the story cautioned. This iffy group included Data I/O and Microsoft, then boasting 100 employees and annual sales of only $15 million.

https://special.seattletimes.com/o/special/centennial/december/silicon_forest.html

1996-12-01-the-seattle-times-silicon-forest.pdf

UW RESEARCH PROVIDED THE CORE CONCEPTS FOR A HOST OF LOCAL PRODUCT DEVELOPMENTS in medical electronics and biomedical engineering. **Worried about "the UW idea drain," the Washington Research Foundation was organized in 1981, joined two years later by the Washington Technology Center, to foster and control the transfer of technology from UW researchers to commercial development.**

As the high-tech boom gained momentum in 1984, the development council published its first guidebook, Advanced Technology in Washington State. **In that Orwellian year, the guide found the top five high-tech employers in the state, by workforce, to be Boeing Computer Services in Seattle, Battelle in Richland, John Fluke in Everett, Keytronic in Spokane, and Tektronix in Vancouver. Sundstrand Data Control, in Redmond, was the only Eastside firm among the top 10.**

among the top 10.

W. Hunter Simpson, a UW regent and president of [Physio-Control Corporation - home], lobbied for the Technology 21 initiative to attract more high-tech industry, noting that "lifestyle, economic practicability, legislative compatibility and educational strength" had made Puget Sound an attractive home for high-tech firms.

****

William Hunter Simpson (born 1926)

BUT THERE WERE STUMBLING BLOCKS. The new entrepreneurs accused the state of being unfriendly to high tech. Immunex CEO Stephen Duzan pointed out tartly that his company would pay nearly $1 million in state sales and business-and-occupation taxes before turning a dime of profit.

Others worried about stringent federal regulations and the lack of local venture capital. But as the '80s wore on, high-tech growth increasingly included local spinoffs and start-ups, as well as established firms from outside the area.

Early in the 1980s, The Times measured these companies by their number of employees and potential to diversify the state economy. But at mid-decade, The Times grew fascinated with the science-fiction promise of high-technology products, from genetic therapies to solar cells, defibrillators to operating systems. The Times wrote breathlessly of start-ups, the grunge bands of 1980s' engineering research and development, as "heady places to work," characterized by roller-coaster risks and opportunities, keen camaraderie and a frantic pace.

Hot pursuit of the Next Great Thing by velvet-sweatshop workaholics contradicted received management wisdom and flattened the corporate hierarchy.

5. **"Woody Allen said, 'Eighty percent of success is showing up.' And, I believe that. If you're on a board, a committee of some kind, and you go to a meeting and nobody else showed up... You support causes by showing up and, obviously, participating."** It is stunning how many boards, committees and groups Bill has participated in over his career. His influence is everywhere you look in Seattle and, if you look at the influence of the Bill and Melinda Gates Foundation, the world. **As just one illustrative example, in the early 1980s he involved me in an effort to move technology from the University of Washington to the private sector. The Washington Research Foundation was organized in 1981 and the Washington Technology Center two years later to foster the transfer of technology from university researchers to commercial businesses. He knew then that it is the positive spillovers a great research university that drives the economic and cultural vibrancy of a city.** Having the opportunity to watch him operate in that setting was life changing in terms of developing my skills.

Has joined Lawrence Livermore ... was an advocate of PCR testing

https://www.ncbi.nlm.nih.gov/books/NBK390426/

"In subsequent discussions, workshop participants considered how to address the issue of inadequate surveillance for mosquito-borne diseases in particular. Both Petersen and Margolis noted that while mosquito surveillance proved a good early indicator of outbreaks of West Nile fever, that is not the case for dengue, nor might it be for chikungunya. Petersen noted that surveillance for mosquito-borne diseases in the continental United States is limited largely to *Culex* mosquitoes, which are very different from the *Aedes* species.

Moreover, Petersen said, mosquito-based surveillance is useful for preventing or controlling outbreaks only if it generates a speedy response. “Really, we want to aim to build local capacity for mosquito-based surveillance. They are the ones making the decisions. They need to make them quickly.” To this end, forum member Roger Breeze of Lawrence Livermore National Laboratory recommended that health departments take advantage of technological advances, such as multiplex PCR, to expedite pathogen analysis. “We are still stuck in a very 1990s paradigm, and bemoaning the fact that we don't have lots of people doing 1990s technology that you can do with a machine,” he observed. He also noted that the Department of Defense is attempting to develop “a completely autonomous system to analyze what [pathogens are] . . . flying around in the mosquito and report to you.”

DR. ROGER GERRARD BREEZE

On Tuesday, June 14, 2016, DR. ROGER GERRARD BREEZE of Washington, DC. Beloved husband of **Diana Jean Schemo Breeze**. Loving father of Liam, Roger, Matthew, Padraic, Sarah and Jacob. Dear brother of Elaine (David) Holcombe and the late Sylvia Fulham. Cherished grandfather of Henry, Stella, Leo and Tennessee. Beloved uncle of James, Lawrence and Emily. Funeral services were held on June 15, 2016, in Washington, DC, with burial in Staten Island, NY. Shiva will be observed at the late residence. Memorial contributions may be made to Kesher Israel, the Jewish Primary Day School or Chai Lifeline. Arrangements entrusted to TORCHINSKY HEBREW FUNERAL HOME, 202-541-1001 (endorsed by The Rabbinical Council of Greater Washington).

2016 - Memorial for "Roger Gerrard Breeze, 1946-2016" in Health Security; (co-author is Karesh)

Source : [HP006A][GDrive]

"Led the world into the modern era of biodefense and biosecurity"

It is with a profound sense of loss to the global biodefense community and the larger scientific community that we write to honor Dr. Roger Gerrard Breeze, who passed away June 14, 2016, after a courageous yearlong fight with cancer.

Roger grew up on a farm in the UK, where he undoubtedly gained an appreciation for animal health and the complexity of disease management in farm operations. His passion for animal health resulted in a distinguished career in veterinary medicine that began at the University of Glasgow, where he received his bachelor of veterinary medicine and surgery degree and a PhD in veterinary pathology.

His academic contributions included many scientific papers that had great impact and resulted in his being appointed to the Royal College of Veterinary Surgeons. Roger came to the United States in 1977, joining the College of Veterinary Medicine at Washington State University, where he served as chairman of the Department of Veterinary Microbiology and Pathology and associate dean.

Roger then joined the Washington Technology Center at the University of Washington, where his passion began for translation of discoveries in infectious disease to global applications in biodefense and biosurveillance.

In the United States, Roger was an early force in advocating for creation of new defense and security systems for defending agricultural assets from offensive use of biological agents. His deep knowledge of needed global reforms was informed by his relationships with international scientists during and following the dismantling of the Soviet biological weapons programs.

Roger provided outstanding executive leadership at the US Department of Agriculture, where in 1987 he joined and led efforts at Plum Island and then, as a senior executive service member, where he established and directed major new programs in agricultural biosecurity and counterterrorism.

Roger also implemented new programs in agricultural biodefense and countermeasures including rapid diagnostics and vaccines as well as reforms in the culture and practices at Plum Island that stand today.

With the breakup of the Soviet Union and the emergence of a vast clandestine bioweapons program that had escaped detection during the Cold War, Roger led the biodefense community into the modern era. He visited the network of research stations, institutes, and manufacturing facilities that the former Soviet Union had compiled into a potent offensive bioweapons enterprise that the world would never have imagined. Beyond the facilities, materials, and machines, Roger saw that the know-how of the most capable scientists and engineers was the real challenge in stepping the world back from the evils of bioweapons.

In away that only Roger could, he saw through to the other side of the coin to appreciate the opportunity to advance global health in unparalleled ways. In his eyes, the scientists of the former Soviet states could make meaningful contributions to the reduction of the threat by not only turning away from bioweapons work but by advancing the science of health security as part of the global scientific community. Through engagement of former Soviet scientists as peers and not adversaries, Roger's work was fundamental in walking the world back from the irreversible abyss of bioweapons.

As a member of the US National Academies Institute of Medicine's Forum on Microbial Threats and Committee on Biodefense Analysis and Countermeasures, Roger made many significant contributions to critical review and analysis of biodefense issues. **For the past decade, Roger served as a senior advisor to the Assistant Secretary of Defense for Chemical and Biological Threats, where he contributed to Nunn Luger Counter Threat Reduction programs and to the Joint Science and Technology Investments on biosecurity and biodefense at the Defense Threat Reduction Agency.**

Over this tenure, Roger was instrumental in launching new global efforts in biosurveillance, vector-borne diseases, molecular diagnostics, and medical countermeasures to thwart the threat of chemical and biological agents. He also worked closely with industry and the national laboratories in energy and defense working in biodefense and biosecurity, and in his last years, served in this capacity as a senior advisor at Lawrence Livermore Laboratories.

Roger mentored many young investigators over his career, helping them understand and execute complex ideas and programs in the international community. His mentorship extended beyond the new investigators to organizations and often to those he worked for.

Roger frequently held his tutorials over a pint. In a small corner of a pub, Roger would recount a small segment of his life. Each story would start with how the world was not quite right at that moment in time, and, through a seemingly impossible mixture of humor, skill, and courage, the earth would be placed back on the proper axis.

It was in this most unique way that Roger passed to many the courage to live beyond their inherited capabilities and achieve something remarkable. It is this indelible mark he made on so many that will be his legacy. It is so much more than pushing back scientific frontiers; it is the legions of his students who will at some time act greater than themselves. His knowledge, humor, and personality contributed much to his accomplishments. He will be missed.

2016 (Nov 09) - The Times UK - OBITUARY - Professor Roger Breeze

Veterinary scientist who was an expert on bioterrorism and highly critical of mass culling to combat foot and mouth

Wednesday November 09 2016, 12.01am GMT, The Times

https://www.thetimes.co.uk/article/professor-roger-breeze-j032gf7df

2016-11-09-the-times-uk-professor-roger-breeze.pdf

Roger Breeze was honoured in the US

When he was working at Plum Island, the US Department of Agriculture's research laboratory, Professor Roger Breeze had to collect blood samples from pigs infected with foot and mouth disease to take to a meeting in Washington. The pigs were being held in separate rooms, which meant that Breeze would have to shower and change before going into each room.

"So to save time I just decided to do it naked," he recalled. "There I was, going from room to room, crawling on my hands and knees with the squealing pigs, buck naked on the cold cement floor. Great fun."

During his time at Plum Island — the equivalent of Britain's Pirbright facility — Breeze helped to develop a farm-gate test that could detect the presence of the foot and mouth (FMD) virus in animals. His was a powerful voice against mass culling. He believed passionately that science and not slaughter was the best way to protect the world against outbreaks of animal disease.

He was horrified during the FMD epidemic in Britain as millions of healthy animals were killed, and he continued to campaign for a different approach. As chief scientific adviser to the US defence department's threat reduction agency, dealing with bioterrorism, he argued that killing animals rather than diagnosing infection made it easier for terrorists to introduce pathogens undetected. "Bioterrorism," he said in 2001, "is a cheap alternative to nuclear war and, chances are, that is how the US would be attacked."

Even leaving terrorism aside, animal-borne pathogens, he believed, posed a grave threat. "People have no idea what's out there," he said. "It's all so goddamn crazy. There's something called mad cow disease in England that we're keeping a close eye on. We've got ostriches from Namibia that could be carrying ticks with Congo-Crimean haemorrhagic fever. We've got Vietnamese pot-bellied pigs, alpacas, llamas, you name it."

Constant border vigilance was vital to protect the US from pathogenic invaders. "We've got Russian immigrants trying to smuggle in crates of their pigeons or hide them under their coats. We had one multimillionaire a few years back who had 28 elephants flown to his own private airstrip, just smuggled them in right under our noses. God knows what he wanted them for. Trying to keep pace with all of this, it's like we're running round sticking fingers in a leaky dyke."

Blunt and outspoken, he was recognised across the world for his expertise in animal husbandry, and his knowledge of the diseases animals can carry. He set up a multibillion-dollar programme to establish the surveillance of public health and veterinary disease in the former Soviet Union, co-ordinating a series of laboratories, which also monitor Russia's biological weapons.

He received the Presidential Distinguished Executive Rank Award — the highest given to a civil servant — in 1998 for his work in safeguarding the nation's food supply and protecting it against biological threats.

Roger Gerrard Breeze was born at Heywood in Lancashire, where his parents owned a small mixed farm with a dairy herd. His great-grandfather, a gamekeeper, had been killed by poachers, and his widow and her son, were turned out of the cottage to fend for themselves. They survived by hiding in unused buildings and eating off scraps for several years. The fact that his parents had managed to purchase 50 acres and build their own farm on the same land was deeply important to him. It is still farmed by the family.

He won a scholarship to Manchester Grammar School, took a veterinary degree, followed by a PhD in veterinary pathology at the University of Glasgow veterinary school, where he lectured from 1968 to 1977. One of his pupils was the son of James Herriot, the author of All Creatures Great and Small.

He was an adventurous cook, taking weeks to work out his menus

His expertise was informed by his own work as a vet. He recalled one occasion when he was delivering a newborn pig that was stuck in its mother's womb. Just as he was finishing, he got another call about a sick dog: "I go right over, knock on the door, and a bunch of Hell's Angels answer. They're all looking at me kind of funny, but I'm too worn out to care. I examine the dog and see right away that it's too far gone with distemper.

"So I take the dog out back and shoot it. The bikers pay me my fee, but they're still staring at me wide-eyed, like I'm some kind of lunatic. It's not until I'm back in my car looking at myself in the rear-view mirror that I see that my face and hair are all blotched and matted with pig placenta. I looked like the psycho vet from hell."

He moved to the US in 1977 to become an associate professor at Washington State University College of Veterinary Medicine, where he served as chairman of its department of veterinary microbiology and pathology and associate dean for research. He resigned in 1987 after funding was cut.

After taking over as director at Plum Island he oversaw a major overhaul of laboratory facilities and initiated research programmes into the genomic basis of disease pathogenesis, genetically engineered vaccine development and the development of innovative techniques to identify the pathogens responsible for disease.

One of those techniques, the pen-side dipstick test, meant that diseases such as FMD could be identified on site rather than from samples sent to a laboratory. It was, he pointed out, simple to use, effective and quick. Despite all his efforts, neither the US nor UK departments of agriculture were prepared to adopt it. Breeze watched as the killing continued. In despair he wrote: "I have five sons and a daughter so I will add a codicil to my will, tasking a great-great-grandchild to check in on [the department of agriculture's] progress in 2061. Maybe with a Ouija board he or she can update me."

Widely read, with a particular interest in books on British and European history, science, and mystery stories, he was an adventurous cook, and would prepare gourmet meals, perusing cookbooks for weeks as he worked out the menus. Despite living in America he read the British press daily and watched the BBC.

He was married twice. There were four sons from his first marriage to Christine Booth: Liam, who works in the chemicals and lab supply business; Roger, who does high-end cabinetry and construction; Matthew, who is a doctor; and Padraic, who manages VIP guests for a casino in Las Vegas. **He has two young children, Sarah and Jacob, from his second marriage to Diana Jean Schemo, a journalist.**

A reporter who interviewed Breeze described him as "a burly, avuncular man in a tweed sport coat and corduroys, a beguiling mix of Oxford professor and old salt". On the wall of his office was a large lithograph of medieval invaders storming a well-defended citadel — a fitting image for a man who spent his career repelling invaders, albeit of the invisible variety. "Don't know who they are," he said. "Goths or something."

Roger Breeze, veterinary scientist, was born on October 10, 1946. He died of cancer on June 14, 2016, aged 69

Research Unit Is Postponing Major Projects

By Diana Jean Schemo

- Dec. 24, 1992

The hiring of a private company to run the Federal center for foreign animal diseases here, undertaken last year to cut costs, has gone so awry that it is not only undermining safety but eroding research efforts, according to newly released documents.

The documents show that because of rising operating costs, spending for research has dropped 20 percent this year. A report by the Agriculture Department, which runs the research effort here, concluded that a "massive cost overrun" had forced the "postponement of important agricultural research projects."

The contractor, the Burns and Roe Services Corporation of Oradell, N.J., says its cost have exceeded projections because the job was bigger and the operations were more antiquated than Government officials had said.

Government officials have not disputed that view, though correspondence between them and the contractor show a yearlong dialogue of disappointment and mutual recrimination. The department also withheld part of a discretionary "award fee," that is essentially the company's profit for operating the center, according to Agriculture Department documents.

Debate Over Privatization

Whoever is at fault, one thing is clear: after paying basic operating costs, the amount left over for research, which had been running about $3.4 million a year in the last few years of Government operation, fell this year to about $2.7 million. Because research is dictated by what is left from the $8.9 million annual budget, that amount will likely continue to drop as operating expenses inevitably chew up a bigger share of the money.

"There's a major concern here, because the whole idea for the privatization was cost savings," said Representative George J. Hochbrueckner, a Democrat from Centereach who has been studying the private company's takeover of Plum Island. "I expect there's going to be close scrutiny of the dollars that were spent." He vowed to seek Congressional review and possible reversal of the privatization.

The difficulties at Plum Island, the country's bulwark against foreign animal diseases, reflect a larger national debate on privatization. Recently, Congress and the Federal Office of Management and Budget have found that rather than saving money, the practice has led to billions of dollars in overspending. In addition, the Agriculture Department has recently come under intense criticism as being too bloated at a time when the number of farmers is declining.

At this Government outpost off the northeastern tip of Long Island, taxpayers spend $3 on roads, electricity, special ferries and other expenses for every $1 spent on research into foot-and-mouth disease, African swine fever, Rift Valley fever and other foreign animal diseases. The original rationale for the vast overhead on such a remote location was that foot-and-mouth disease is too infectious to work with on the mainland. But that reasoning is outdated, because harmful agents can now be contained safely in a modern center. Concern From Cattle Owners

Tom Cook, vice president for governmental affairs at the National Cattleman's Association, said his group planned to discuss the problems at Plum Island at its next meeting. "Our bottom line," he said, "is we want to see the most dollars made available for research." He said his industry, which could lose an estimated $2 billion through an outbreak of foot-and-mouth disease, would favor a study to determine whether the research could be done at lower cost on the mainland.

Among the sacrifices in research was the slaughter of pigs specially bred at Tufts University for experiments on cellular immunity of African swine fever, which scientists on the island had to forego last September when the initial cost overruns became known, said a source on the island who spoke on condition of anonymity.

Last week, the Agriculture Department opened Plum Island to the press for the first time in 14 years amid questions surrounding the operation and work of the island.

Scientists outlined the research and diagnostic work conducted on the island, but an examination that strayed from the prepared tour showed puddles in the corridors, rusted doors and cracked walls in rooms for animals infected with disease. There were no burglar alarms or locks on the doors of rooms containing concentrations of deadly viruses.

The move to a private contractor reduced the work force by a third, eliminating the fire department, reducing the number of security guards and relaxing safety precautions. Electronic security measures that could compensate for the cutbacks, like motion detectors and computerized door locks, have not been included in planned renovations. Plans for Renovations

Agency officials, who had gathered to defend safety procedures at the island, did not dispute a 1983 report by the National Academy of Sciences that recommended closing the center at Plum Island. Because of advances in biosafety containment, the report said, much of the work done here could be done safely on the mainland at far lower cost. Manuel S. Barbeito, the agency's top authority on biological safety and one of the authors of the 1983 report, told reporters at the tour that he still agreed with its recommendation, though it was ruled out as politically unfeasible.

But a few hundred yards away, workers were building a $20 million addition to one of the buildings that would consolidate most operations on the island,

part of a 10-year, $60 million government renovation project. The work includes construction of new offices, a library and some laboratories, but does not include the refurbishing of animal rooms or the research laboratories for foot-and-mouth disease.

C. G. Crawford, the director of Plum Island, said the consolidation plan would save on operating expenses by closing 24 buildings, and the savings would ultimately be used to renovate animal rooms and the research labs. "It is not state of the art, but we will have everyone consolidated," he said. "It's expensive to live spread out all over the island."

He also said the sudden increase in cost for running Plum Island was unrelated to the move to a private contractor. "This isn't a matter of a contractor versus the Government, it's a matter of the rising costs of operating the island." Several Extra Costs

Documents show that specifications for privatization failed to include such basics as janitorial services for the research building and manned operation of a decontamination plant.

As a result of such omissions, the Federal Government will have to pay Burns and Rose $5 million for the basic contract, and another $204,000 for support of the construction project, instead of the $4.2 million originally quoted by the company. And scientists said they were dumping their own trash and mopping their own floors because janitorial services would be yet another expense.

Another $91,000 that Congress appropriated for research into foreign animal diseases went to Burns and Roe for legal fees to fight unionization, according to Government documents.

Privately, some researchers said they feared that costs under a private contractor were swelling so much that they were strangling the research effort. Concern Over Research Funds

Roger Breeze, director of the research program, acknowledged that the funds left for research from his $8.9 million-a-year budget were declining. "Every year it costs more to do research, and the available amount of money rarely grows in proportion," Dr. Breeze said. "I'm not responsible for the operation of the support services and facilities at Plum Island. I just have to rely on those who are that they are trying to get the best value for the money."

Mark Fagerlin, the president of Burns and Roe, blamed the Agriculture Department for the problems with privatization at Plum Island. "I believe strongly in the whole privatization issue," he said, "and the fact that the Government doesn't implement it efficiently doesn't make me believe it less."

In his written response to the company's performance rating, the agency's basis for deciding whether to grant the company its $300,000-a-year profit, Mr. Fagerlin said the "increased costs" were caused by changes to the contract for services the Government failed to properly specify in the bidding documents.

He has asked the Government to reconsider its decision to deny the award, arguing that while it has made mistakes, Burns and Roe "has performed satisfactorily under extremely difficult circumstances."

Correction: Dec. 26, 1992

Because of an editing error, an article on Thursday about the Federal center for foreign animal diseases on Plum Island, L.I., misstated the total to be spent on construction and renovation projects. It is $80 million.

THREATS AND RESPONSES: BIOTERRORISM; Scientists Discuss Balance Of Research and Security

2003-01-10-nytimes-threats-and-responses-bioterrorism.pdf

By Diana Jean Schemo

- Jan. 10, 2003

Leading scientists began talks here today on whether and how to withhold publication of scientific information that could compromise national security.

The discussions at the National Academy of Sciences follow a raft of post-Sept. 11 restrictions on research into some 64 substances that could be used in biological weapons. The discussions were also partly an effort to fend off potential government censorship or other steps to control unclassified research that the new domestic security law terms "sensitive."

The talks were prompted by the hesitance of microbiologists to publish their full research in scientific journals out of concern that terrorists could use the information. While restrictions on research have long been a fact of life for chemists and nuclear physicists, they are new and not entirely welcome among microbiologists, who say data must be published so other scientists can verify the quality of the research by reproducing the results.

"We in the life sciences are in the process of losing some of our innocence," said Stephen S. Morse of the Joseph L. Mailman School of Public Health at Columbia University. "Knowledge, often using very simple materials, is also the critical ingredient in making a biological weapons advance."

The discussions brought together two communities that have often viewed each other with distrust, if not disdain: security experts and scientists. While some scientists contend that the best defense against biological weapons is robust research that is widely accessible, security specialists maintain that scientists are being naïve at best, and reckless at worst.

"These two communities, if we do not start now with a constructive dialogue with each other, we're going to turn this into a disaster," said John J. Hamre, president of the Center for Strategic and International Studies, which sponsored the meeting along with the National Academy of Sciences.

Dr. Hamre noted that the political climate in Washington and around the nation supported greater restrictions on science and civil liberties in the name of fighting terrorism. If scientists did not take the security concerns seriously, he said, politicians and policy makers with little understanding of science would step in with "blanket restrictions on science, not knowing what's sensitive and what's not sensitive."

"For precious little security, we would have devastating effects for the conduct of science," said Dr. Hamre, a former deputy secretary of defense.

John H. Marburger, director of the White House Office on Science and Technology Policy, noted that under a Reagan-era directive, research that was not classified as secret when ordered by the government could not be classified retroactively. But citing a report by the Johns Hopkins Center for Civilian Biodefense Strategies, he said such "traditional regulatory approaches are not well suited to biosecurity concerns."

Dr. Marburger did not reveal any impending policy changes, but said, "Those concerns are public concerns, and to them the public deserves a rational and serious response from its government."

The discussions, in a sense, ran against the instincts of many scientists here. Bruce Alberts, president of the National Academy of Sciences, stood before a picture of children gathered around a giant bust of Albert Einstein and recalled the society's founding mission: "to make science much more accessible to the nation and the world." Today's discussions pondered the opposite.

Since the Sept. 11 attacks, new laws and regulations restrict who may work on 64 "select agents" that could be used to make biological weapons, barring students or scholars with a drug conviction or a history of mental illness and those from countries labeled sponsors of terrorism from participating in research. Universities and clinical and research laboratories have inventoried their select agents, with many of them urging researchers to destroy their stocks unless they were needed for current projects. Scientists found with such agents in violation of the law could face five years in prison.

Lewis Branscom, a Harvard professor who is advising the university on future work with select agents and other security issues, said he feared not so much a "frontal assault" on the First Amendment's freedom to speak and publish as "an elaborate web of controls that look and smell and taste like classification."

Barring groups of people -- certain foreigners, marijuana smokers or people with clinical depression, say, from the research, he said, "reminds me very much of the McCarthy days."

Ronald Atlas, president of the American Society of Microbiologists, noted that proposed regulations issued in December included prohibitions on certain avenues of experimentation, and said he was concerned by First Amendment issues.

"Do you have a right of inquiry?" Dr. Atlas asked. "It's almost biblical: when God says, 'Thou shalt not eat of the Tree of Knowledge.' "

In the cold war, the United States faced a technologically advanced adversary, but today's threat from enemy nations and terrorists is more diffuse, with discoveries that appear benign sometimes providing the clues for weapons to spread disease. Outlining a hair-raising next generation of biological armaments, George Poste, chairman of the bioterrorism task force at the Defense Department, said, "I do not wish to see the coffins of my family, my children and grandchildren created as a consequence of the utter naïvete, arrogance and hubris of people who cannot see there is a problem."

CHAPTER 1 - 1975: The Lyme Connection

pg 23 to 26

PLAYING WITH FIRE

Former Plum Island Director Dr. Jerry Callis says the association between Lyme disease and Plum Island is absurd. "Not now or ever had we anything to do with Lyme disease," he says in measured impatience. "It's existed in Europe for years—I've had it three times." Asked if Plum Island ever worked with ticks on Plum Island, Dr. Callis gave a surprising answer.

"Plum Island experimented with ticks," he says, adding, "but never outside of containment. We had a tick colony, where you take them and feed them on the virus, and breed the ticks to see how many generations it would last, on and on, until it's diluted. Recently, they reinstated the tick colony."

Tick *colony*?

Journalist Karl Grossman pressed a Plum Island lab chief some years ago about John Loftus's claims in *The Belarus Secret*. "My impression is that there is no truth to this," said Dr. Charles Mebus. But like director Harley Moon, Mebus had not been there in the 1950s to form an "impression." He did tell the roving reporter what he knew firsthand: Plum Island previously worked on—and continued to work on—tick experiments on "soft ticks" that transmitted heartwater, bluetongue, and African swine fever viruses, but aren't normally known for spreading the *Bb* bacteria. But that wasn't the complete picture.

The lab chief failed to mention that Plum Island also worked on "hard ticks," a crucial distinction. A long overlooked document, obtained from the files of an investigation by the office of former Long Island Congressman Thomas Downey, sheds new light on the second, more damning connection to Lyme disease. A USDA 1978 internal research document titled "African Swine Fever" notes that in 1975 and 1976, contemporaneous with the strange outbreak in Old Lyme, Connecticut, "the adult and nymphal stages of Abylomma americanum and Abylomma cajunense were found to be incapable of harboring and transmitting African swine fever virus." In laymen's terms, Plum Island was experimenting with the Lone Star tick and the Cayenne tick—feeding them on viruses and testing them on pigs—during the ground zero year of Lyme disease. They did not transmit African swine fever to pigs, said the document, but they might have transmitted Bb to researchers or to the island's vectors. The Lone Star tick, named after the white star on the back of the female, is a hard tick; along with its cousin, the deer tick, it is a culprit in the spread of Lyme disease. Interestingly, at that time, the Lone Star tick's habitat was confined to Texas. Today, however, it is endemic throughout New York, Connecticut, and New Jersey. And no one can really explain how it migrated all the way from Texas.

Entomologist Dr. Richard Endris joined Plum Island in 1981 to spearhead increased tick research. Endris and the African swine fever team leader, Dr. William Hess, went to Cameroon and other parts of Africa on tick-hunting safaris. They stuck their arms deep inside burrows and were occasionally bitten by snakes and rats. They searched out wild warthog burrows in the brush using a "tick sucker"—a reversed leaf-blower with attached sieves and filters—to strain hundreds of tick specimens out of the moist sand. They set out little blocks of dry ice thirty feet apart and watched the ticks march to the smoking lumps (the carbon dioxide attracted them, fooling the ticks into thinking it was the exhale of mammalian hosts). Endris constructed two high-hazard "insectories," insect labs, one in the back corner of Laboratory 101 and another in the basement. Each insectory was equipped with sand-filled climate chamber incubators with lighting that simulated photoperiods, protective rims around the airlock doors covered in sticky glue, and seals across all windows and drains. The ticks were fed on the blood of hairless suckling baby mice, where they would attach and molt and breed. All told, he reared over 200,000 hard and soft ticks of multiple species.7 Endris handled the tiny parasites with extreme care, using fine art brushes to move the minute nymphs into a transfer container—a urine specimen cup and a screen, glued together with globs of plaster of Paris. To test the ticks, the scientists first anesthetized diseased pigs, goats, mice, and calves, then placed the ticks on the sleeping animals. The ticks immediately attached and dug their mouth parts in. After a few hours of feeding, technicians detached the ticks with soft-tip forceps.

Endris set up quite an impressive tick colony when he arrived in 1981. But there was substantial earlier tick research. Dr. Hess's tick experiments in the 1960s and '70s with the Lone Star tick and others were conducted in unsafe conditions. Endris said the early tick research wasn't focused: "Plum Island was

1960s and '70s with the Lone Star tick and others were conducted in unsafe conditions. Endris said the early tick research wasn't focused. "Plum Island was not set up to deal with ticks at all." In 1980, a Plum Island scientific oversight committee urged the USDA to hire "an appropriately trained medical entomologist," calling it a "priority item." The consultants also "strongly recommended" the construction of "a modern, approved insectory be undertaken for future research."8 The advisers had serious concerns 7Dr. Endris also conducted experiments with sand flies on Plum Island in 1987 to test transmission of leishmaniasis, a bacterial ailment that if left untreated, has a human mortality rate of almost 100 percent. It is characterized by irregular bouts of fever, substantial weight loss, and swelling of the spleen and liver. The work was performed under contract for Fort Detrick, and serves as another example of a deadly germ warfare agent worked on at Plum Island for the Army, with no public knowledge or public safety precautions taken. Lab 257 25 with the primitive tick colony then in operation under the veterinarian Dr. Hess, who had been with Plum Island since 1953.

Dr. Endris and his boss, Hess, were both fired in 1988 by incoming director Dr. Roger Breeze, who promptly closed down their precious tick labs. They wrapped up research, put the viruses back in the freezers, and dumped the ticks into the autoclave, which steamed them at over 100 degrees centigrade.9 Endris, who went to work for Merck Pharmaceutical, scoffs at a Plum Island–Lyme disease connection. "Those kind of comments . . . indicate a gross ignorance of Lyme disease." Before being fired by Dr. Breeze, Endris served as the scientific member of Southampton's Joint Lyme Disease Task Force, and says with conviction he never heard of any Lyme disease relationship.

But Dr. Endris wasn't on Plum Island in 1975; his entomology expertise and the "modern, approved" tick insectory he built were a full six years away. Unfortunately, Dr. Hess, who could shed light on the old tick experiments, died in 1999 in New Hampshire. It is clear, though, that he was proud of and cherished his thirty-five-year scientific career there—his family scattered his ashes in Plum Gut among the trade winds of Plum Island.

Dr. Garth Nicolson, a national expert on immune system disorders, isn't satisfied with the ecological Lyme disease theory. "There's a high possibility," says Nicolson, who runs a California medical institute and has testified before Congress on Gulf War Syndrome, "that Lyme disease is a combination of infectious agents let loose from a laboratory, possibly from Plum Island by birds to the coast, causing multiple infections." Nicolson contends Bb is often found in tandem with mycoplasma bacteria, which causes many of Lyme's debilitating symptoms. Mycoplasmas found in foreign countries were studied on Plum Island since its inception; they may have been cross-contaminated with Bb and escaped the lab in the 1970s.

Dr. Wally Burgdorfer, who discovered the Lyme disease bacteria that bears his name, says, "The big question is where the ticks came from." He believes that imported deer from Europe brought the deer tick species, and with it the bacteria, to America, where all three proliferated. I ask Dr. Burgdorfer about the Lyme disease connection to Plum Island. "Touching on something like that may cause a hell of a lot of problems," he says.

"You have to show a development in the 1960s and 1970s, and it seems impossible—

"Unless," he continues, "they cultivated the tick species on Plum Island, and unknowingly fed some ticks on animals or humans and a Borrelia spirochete [bacteria] accrued." Dr. Wally Burgdorfer isn't ready to prove the link, but he's quick to point to the proven track record that helps make the case: "Plum Island is proof of the existence of breaks in biological safety." And of a proposed biosafety-level-four upgrade at Plum Island, the most dangerous, he admits, "Even if it's biosafety level four [the highest containment level], that doesn't mean it's safe."

CHAPTER 2 - EAST END MEETS WEST NILE

pg 28

Birds were losing their minds at the Bronx Zoo. Some flew in perpetual circles. Others died in their cages. Veterinarian in charge [Dr. Tracey S. McNamara (born 1954)] was concerned about the twenty-four birds— ducks, owls, a bald eagle, a black-crowned heron, and magpies— suffering in perhaps the most famous zoo in the world in August 1999.

McNamara had recently attended Plum Island's foreign animal disease school, where vets were taught how to diagnose exotic disease outbreaks and respond. But when she dialed the emergency telephone number set up to report possible foreign animal diseases, she found the line disconnected. The program was presided over by new Plum Island acting director Dr. Lee Ann Thomas, who had recently replaced director Dr. Alfonso Torres, who had replaced director **Dr. Harley Moon when he left to return to Iowa in 1996, who replaced director Dr. Roger Breeze. Since Dr. Breeze's departure, there had been no continuity in the laboratory's leadership. According to sources, no one wanted the job because Breeze pulled the lab's strings from afar.**

In the last few days of that August, Dr. Deborah Asnis, a specialist in infectious disease at a small Queens hospital, noticed an unusual pattern. Two and then four hospital patients, all elderly, contracted fevers with headaches, muscle weakness, and mental ailments that progressed

[....]

Pg 33 :

If Plum Island was uninterested in West Nile virus in the past, it seems to have acquired a taste for the germ. In October 1999, on the heels of the outbreak, Lab 101 held four healthy Equus caballus, the common domestic horse. They were given intravenous injections of a West Nile virus strain obtained from Dr. McNamara's Bronx Zoo collection of frozen infected birds. Each day, as the horses progressively sickened, animal handlers examined them. The scientists noted that the virus was not detectable in the blood until thirty days post-infection, but occurred within forty-five days; all four succumbed. Autopsies were performed, and four new "horse adapted" virus strains were extracted for the Plum Island virus library. If West Nile virus is not detectable in horses for thirty days, that means the North Fork horses became infected with the virus bug in July of 1999, and perhaps earlier.

This all begs the question: did Plum Island have West Nile fever virus at the time of the outbreak? [Dr. Robert Ellis Shope (born 1929)]'s Yale Arbovirus Research Unit (YARU) across Long Island Sound held twenty-seven different strains of West Nile virus in its New Haven, Connecticut, freezers until 1995, when he moved to the University of Texas and took his strains with him. YARU and Plum Island often trafficked in viruses, most notably the dangerous Rift Valley fever virus in 1977. Had Dr. Shope shared West Nile virus reference samples with his friend Plum Island director Dr. Roger Breeze —the island laboratory being the only official location where foreign animal germs like West Nile virus are supposed to be studied? When I ask him, former Plum Island director Jerry Callis says he didn't think it was in the virus repository in August 1999. "I never thought it was important enough.

It's more of a mild virus, not among the serious animal virus diseases," he says, even though it appears fatal to birds. **But Callis had left Plum Island in 1987 when Dr. Breeze came in.** USDA official Wilda Martinez confirmed Dr. Callis's beliefs when she assured the public that West Nile wasn't studied there prior to the outbreak—but she declined to say whether the virus was in their freezers.

CHAPTER 8 - RIFT VALLEY FEVER

pg 128 -

[...]

THE RIFT VALLEY FEVER EXPERIMENT

Unlike bacteria, which can be seen easily under a traditional microscope, viruses are too small to be detected. To measure the concentration of viruses, scientists use the plaque-reduction method, whereby a visibly clear area in a culture dish, called a plaque, is left behind after the virus destroys the healthy culture cells. By measuring the plaque—essentially the damage the invisible viruses have done—you can get an idea of the titer, or how virulent and concentrated the virus is. Viruses are measured in plaque-forming units, or PFUs. In the Plum Island study of the deadly strain of the Rift Valley fever virus, the lab techs took a starter culture of African green monkey kidney cells out of the freezer and propagated them in culture plates using a growth medium of amino acids and heated calf fetus serum. To brew large quantities of virus, they fed Zagazig 501-plus on the monkey cells they cultured inside sterilized fermenters, not unlike the ones seen at a microbrew pub. Zagazig 501 was the Rift Valley fever strain pulled from a fatal hemorrhagic human case during the Egyptian outbreak. Peters added some kick at Fort Detrick—the plus—when he passed the virus through two sets of lung cell cultures taken from rhesus monkey fetuses. It was potent as hell. From the fermenter, they decanted the slurry into hundreds of 1-milliliter ampoules and stored them in nitrogen-cooled freezers at minus 70 degrees Celsius. They thawed each ampoule immediately before pacing briskly through the "hot corridor" to the animal room to inject a test animal.

Rift Valley fever virus affects its victim much like the well-known Ebola virus. Ten of the sixty sheep were used as controls, meaning they were not afforded the luxury of a vaccine. Twelve hours after the unlucky ones are exposed to the virus, viremia—the onslaught of a virus infection within the body—begins. Their temperatures rise sharply and their hearts beat rapidly in an attempt to circulate an immune response to parts of the body suffering from localized attack. But their immune systems cannot counter the multiplying germ. The blood circulates viruses to all quarters of the body, where they attach to the surface of organ and membrane cells, then infiltrate those cells. Within the cytoplasm, the virus hijacks the cell's machinery and replicates itself exponentially. Inside of one hour the cells lyse, or burst, unleashing thousands of new baby viruses upon neighboring healthy cells, where they attach and repeat the vicious cycle ad infinitum.

The exploded cells cause edema, or large buildups of fluid in the connective tissues throughout the body. The sheep spasm and lose their gait, leaning up against the cell-block wall of the windowless room to stay upright. A pregnant ewe spontaneously aborts her young onto the floor in a grotesque scene. The sheep vomit blood and discharge red-tinged mucus from their noses. The dizziness in their heads makes them slide, one by one, down the wall and onto the concrete floor.

Within forty-eight hours, eight will be dead. Samples of each animal's blood-riddled excreta are taken to see if the virus passed through. The two that make it to recovery are then killed, along with the fifty sheep in the test flock. Each is lifted onto a cart by an animal handler and wheeled into the necropsy room. On

kill day, veterinarians necropsy (animal autopsy) each of the animals under bright examination lights, snap photos of the diseased internal organs for later analysis, clip tissue samples from here and there, and send the carcasses down the chute to the incinerator charging room.

The initial experiment was a success. The human vaccine produced immunity in all of the vaccinated sheep and warded off the virus.

With the April 1 safety deadline met, the Plum Island scientists decided to push their luck. They revaccinated employees and continued the groundbreaking research, extending the study through the end of April and into the start of the mosquito season. Supplanting the ubiquitous foot-and-mouth disease virus work, Rift Valley fever fast became the island's germ of choice. Eight Shetland ponies injected with Rift Valley fever were observed daily and their rectal temperatures recorded for forty days to see if they were susceptible hosts or carriers. Necropsied on day forty-one, the ponies showed no internal signs of disease or clinical signs. However, the vets found that the Arabian horses maintained low levels of viremia, and, as such, were potential reservoirs to infect biting mosquitoes.

Next, they brought in another sixty-three sheep for a third Rift Valley fever project. This study revealed that infected sheep could pass USDA food inspections for human consumption. Drs. Dardiri and Walker observed the virus lingering in spleen tissues, but reasoned that "the spleen is not normally eaten." The scientists also announced in a press release that they produced "antigens and reagents" for future use. Put more plainly, they were brewing Zagazig 501 virus in gross quantities on Plum Island.

As the studies progressed, tensions eased between the Plum Island and Suffolk County officials. Together they drew up emergency plans for hurricanes, civil disobedience (like violent animal rights demonstrations), fires, sabotage, radiological incidents, and unauthorized removal of an exotic pathogen. But the détente was short-lived.

Dr. Martin Mayer, the county's disease control chief, got a call from an investigative reporter over the weekend of April 29. Did he know Plum Island extended research until May 8, eight days into the mosquito season and six weeks after they promised to conclude? "No, I'm completely unaware," Mayer said. He called the island first thing Monday morning, and Walker promised him they would be finished—honestly, this time—by week's end. "A couple of extra days aren't going to hurt," conceded Mayer, calling it a "minor" deviation. Yet mosquitoes in the region were hatching and beginning to fly, according to the county's mosquito control chief, who told Newsday the pests would not be swarming for another week or two over "dry areas" like Plum Island. This "dry area" boasted three freshwater swamp beds covering 120 acres of an 843-acre island, and over twenty different species of mosquitoes called Plum Island home. Dr. Callis said the project ran late because researchers were in the middle of their studies.

While Plum Island faced three ongoing investigations—one for a virus outbreak, one for a construction fiasco, and one for criminal fraud—scientists uncorked vials of deadly Zagazig 501 (and its progeny) and infected cattle, horses, sheep, pigs, and even seals. Few of the air filter, incinerator, and negative airflow repairs were complete.

The labs were vulnerable, and the USDA was compounding the risk.

[...]

A TROUBLING SCENARIO

Discussing Rift Valley fever—over a decade before the West Nile virus became part of the American lexicon— [Dr. Clarence James Peters (born 1940)] and Plum Island director Dr. Roger G. Breeze wrote, "[T]he most probable routes of introduction of Rift Valley fever into the United States are via a viremic person who will be bitten by a mosquito or an infected mosquito aboard a plane.

The infected mosquito will then infect a susceptible animal in which the virus will be amplified for the infection of more mosquitoes."

But what if the virus performed an end run, not from the nation's international airports, but from within, set free from a poorly run top-secret facility where it was kept in large quantities? What might have happened?

And how?

Chapter 9 - "Crossing the Rubicon"

147 to 150

All the negative press, the PR missteps, the biological bungling, and the outright mismanagement had impacted Dr. Callis's reign as Lord of the Manor. No longer was he the twenty-seven-year-old kid scientist who, at Doc Shahan's side, helped build the "World's Safest Lab."

One source described the situation on the island at the time as "stagnation."

Another, "benign neglect." "Jerry had a helluva vision about Plum Island," says his successor, Dr. Roger G. Breeze. "But that vision sort of ran its arc. And I'm not trying to be critical about where that arc comes to rest."

But rest it did.

A former official cites the director's penchant for travel as a contributing factor. "I'd say he was one for the ages, one of the few scientists who was a good leader and a good scientist. But by then his mission wasn't running Plum Island—it was running around the world, visiting other countries doing disease work, addressing meetings, and attending seminars—that was his agenda. And that's one of the reasons why Plum Island went to hell."

All the negative newspaper stories, egged on by Karl Grossman, Newsday, and others—much of it warranted, but not all of it—weathered the old veterinarian beyond repair. "There's one thing I think Jerry failed at," says Dr. Jim House, "and every director after him has also failed at—public relations. There was and is no program to explain the benefits of the place, the fact that it is a national treasure, that it is needed. Nobody does that—nobody goes out and gets the community involved and lets them understand it."

Much of that failure was an extreme desire for secrecy. "I think Jerry had this old-school cold war mentality," House contemplates. "You must remember, the

Russians thought Plum Island was a really wild site out there. They knew it existed, and they played this game, they built it up in areas, saying it was a biological warfare site, or at least something of cold war value. And this just carried on." Dr. Carol House, also a retired Plum Island scientist (and Jim's wife), adds, "I think Jerry liked that." **Though the outside advisory committee—now headed by Dr. Robert Shope—urged Plum Island to hold frequent press events, the hurtful, enduring sting caused by Grossman's 1971 AP germ warfare story caused Callis to lock up the gates tighter. P**roblems and difficulties on Plum Island were met not with candor and public recognition, but with suppression. Ironically, the lack of sunlight on Plum Island's activities over the years would lead the public—and rebuffed curious news reporters—to always assume the worst, fanning the flames of mystery, intrigue, and rampant speculation.

In one of his final communications, an uncharacteristically dry memo lacking the usual pleasantries, Dr. Callis told Plum Island employees that federal budget reduction legislation called for 5 percent cuts across the board, further depleting Plum Island's shoestring budget. To fight skyrocketing costs, he was considering a proposal to consolidate the two laboratory buildings into one, close the old Army-vintage administration buildings, and make Laboratory 101 a self-contained operation. This might—might— require cuts in staff, he said, but lest anyone worry, he would reduce positions through natural attrition, not through layoffs. By this time, Callis twice had stopped a move to privitize the federal workforce and reduce salaries, benefits, and the total number of staff positions. Callis may have faulted in many areas, but he remained doggedly loyal to his people, and to the promises he had made to them a quarter century ago: "respect personal dignity . . . recognize work achievement . . . provide work security. . . . Believe in the Golden Rule and always practice it."

Just days after his memo, the USDA hammer came down heavily.

Regime change came quickly on Plum Island—Washington called up Jerry Jackson Callis, and told him his time was up.

"Let's just say retirement was not his own idea," says a source. "It happened abruptly—there were a lot of people and politics involved. He had really been there too long. We needed much better progression. We didn't need one person in one place—no matter how good he was." While Dr. Robert Shope maintains Callis's retirement was his own decision, other sources confirm he was "pushed out."

The USDA "elevated" him to the post of senior research adviser. This allowed him to maintain regular contact with his beloved island and offered another perk. Says one administrator familiar with the offer, "They said to him, 'We'll give you an office on the island, and carte blanche for several years on travel.' And Washington did that by dragging in money from other agencies and hidden places. They took real good care of him. It was a payoff, a golden parachute, if you will—they had to give it to him."

Dr. Roger Breeze, his successor, elaborated. "Jerry Callis is a very exceptional person. The United States never had a facility like Plum Island, until the debacle in Mexico hit between 1946 and 1952. People had to go out there, find it, and build it. Meanwhile, Jerry went over to Holland to learn about viruses from the Dutch. Now if you said to someone today, 'Hey this is the federal government and we want you to go to a foreign country to learn this whole new thing, and when you come back, we're going to build a laboratory for you,' people would laugh in your face.

'Yeah—sure—bullshit—can I get that in writing?' But Callis did it." Lucrative offers from private laboratories had come his way for years, and he turned them all down. Plum Island was his life, and the island's life was in many ways his—it was his first job out of school, the only job he'd ever worked. Like a parent to his child, he could never see fit to abandon it.

And there he remained for four decades.

Most of those interviewed for this book have the highest respect for Jerry Callis. "Jerry built Plum Island into a very prestigious place," says Carol House. "I think [his successors] had a hard time following in his shoes—anyone would, because of his memory and his depth of knowledge on everything that was Plum Island. A good—no, a very good manager."

Dr. Shope acknowledges that "every leader has some disgruntled employees," but he found Dr. Callis nothing but "a real straight arrow." John Boyle, a former budget director at Plum Island, called him "a brilliant man, at one time a great scientist, and probably still that way today." Over time, a fondness and respect bonded the staff to their beloved director. "It wasn't always perfect," says building engineer Stanley Mickaliger. "There were discrepancies, and sure there were gripes—which were all normal. But we all understood something very important—Jerry Callis took care of us."

When asked about his retirement, Callis says simply and humbly, "I've enjoyed my career tremendously."

Plum Island librarian Frances Demorest—second in seniority to the now retiring director—saluted her director:

Dear Doctor Callis:

Our thoughts return to 1953 and the local turmoil over the decision to locate the Laboratory at Plum Island off Orient Point. The representatives from USDA were not received warmly but, as time went on, the turmoil and anger subsided. It has been a long time and we have crossed a lot of water together!

Through the efforts of two fine Directors, Dr. Shahan and yourself . . . the Center was recognized both nationally and internationally. Also, the Center made a tremendous economic impact on this end of Long Island.

Harrison and I trust you will experience a busy, fruitful, productive retirement, and enjoy GOOD HEALTH and fond MEMORIES for a "JOB WELL DONE."

Not everyone lamented his retirement. Some expressed glee over the change in the guard and looked forward to replacing the dusty old administration with fresh new leadership. "A lot of people thought of him as an emperor who treated Plum Island as his personal fiefdom," one former scientist says, "and to a degree, I believed he did. Whether your [research] program was funded depended on whether he liked you or not." But those who cheered Callis's departure didn't realize how good they had had it. "I tell you what," says one of them. "Six months later we were making novenas to Saint Anthony that he'd come back."

Because what came next would be far worse.

"You know, there's this old saying on Plum Island," says one worker.

" 'When Dr. Callis went, the island went with him.' Once they moved him out, everything went downhill.

"In my humble opinion, this is when the whole island started to fall apart."

Lab 257, CHAPTER 10 - "The Kingdom and the Glory"

(pages 153 - 175)

Roger Breeze wanted to be a vet because the local veterinarian was the most successful person who came by his family's sixty-acre dairy farm in the north of England. The Breezes milked cows and raised chickens in the 1950s. They delivered creamy milk each morning to their customers' doors, along with fresh eggs and chickens, eking out a living by profiting on both production and delivery.

Roger's idea was to follow in that country vet's footsteps. When he was seventeen, he attended vet school at the University of Glasgow in nearby Scotland, one of the oldest universities in the world. Though it wasn't his original plan, upon graduation he was given the coveted opportunity to teach at Glasgow. It was a prestigious appointment he couldn't turn down. To help make ends meet, he opened a local vet practice and worked nights and weekends. "I had some crazy nights," Breeze told Outside magazine:

- Once I had just finished pulling a newborn pig that was stuck in its mother's womb when I get another call about a sick dog. I go right over, knock on the door, and a bunch of Hell's Angels answer. They're all looking at me kind of funny, but I'm too worn out to care. I examine the dog and see right away that it's too far gone with distemper. So I take that dog out back and shoot it. The bikers pay me my fee, but they're staring at me wide-eyed, like I'm some kind of lunatic. It's not until I'm back in my car looking at myself in the rearview mirror that I see that my face and hair are all blotched and matted with pig placenta. I looked like the psycho vet from hell.

Two years into his professorship Breeze emigrated to America—a bold and unconventional move. He saw that young go-getters like himself, no matter how bright they were or how hard they worked, would be shunted into Glasgow's faculty caste system. There were eighteen veterinary pathology positions in all of Britain, and a slow thirty-two-lockstep ladder of advancement. Every professor parked on the same step was paid the same meager salary. "It didn't matter whether you taught Sanskrit or law," he remembers. " 'As long as there is still death, there's hope,' we used to say."

Roger Breeze disliked the stuffy peerage. What does your father do? Who do you know? What high school did you attend? No one seemed to care about what was really important—one's talent and ability to perform. "Can you imagine people in America asking, 'Where did he go to high school?' " Breeze asks. "How the hell would anybody know where to look, let alone care?"

The religious discrimination also bothered him. Once a man "of great power" at Glasgow asked him to return to his alma mater to teach a discipline he didn't know. When Breeze explained his lack of knowledge in the discipline, the man said it didn't matter, saying, "There are too many English Catholics up here teaching and we need more Scottish Protestants." Ironically, Breeze was neither a Scot nor a Protestant—but with his University of Glasgow pedigree, they assumed he was.

All those stodgy trappings—and the royal mahogany paneling and leather furniture—never aroused him. No one in America cared what the laboratory lobby looked like and what the scientists' last names were, so long as they produced great science. In America, Breeze was more at home than he ever was in Britain. "Here it's 'On with the job!' That's what I like."

THE BREEZE REIGN

For all but a few of today's scientists, it's not about the money. It doesn't matter if you earn a million per year if five years down the road you are less employable than you were when you started. It's about science, but also, apparently, the glory. "They all want the glory," Breeze asserts. "That's what the whole thing is sold on today, and as director, your job is to provide that." To reach scientific brilliance, you need the proper tools, and that means expensive equipment. Most scientists do not question their ability; what they do question is whether a potential employer can offer the equipment and support they need.

Dr. Breeze's theory, honed in his first career post in the New World, went like this: institutions like Yale and Columbia, because of their reputations, have no problem recruiting postdoctorates for their three-year apprenticeships with lab chiefs. In this regard, America was little different from the Old World. Elsewhere down the ladder of prestige, that isn't quite the case; competition is fierce among the rest, and to prevail, a lab director must deliver the resources.

In 1984, after just a few years on United States soil, Dr. Breeze rose to chairman of the microbiology department at the Washington State University vet school, where he oversaw twenty-five faculty members. The school had a unique approach to its faculty recruitment that fit well with Breeze's management style. "It was a very entrepreneurial university," he recalls. "You could walk into the president's office and tell him you had a problem and you could cut a deal." He could reduce a salary or eliminate a position altogether and use those funds to buy an electron microscope for a star faculty member. Utilizing this flexibility, Dr. Breeze built the best department of its kind in the nation. In the mid-1980s, however, a new provost arrived. Out went the freewheeling philosophy. Now, over half of Breeze's powerhouse faculty was being courted by rival universities and bombarded with lucrative job offers.

On a cold January morning Breeze went to the provost's office to plead his case. "Listen," he said in his deep Scottish-sounding brogue. "You have to give us the flexibility we once had—please—or we're going to lose our people!" The provost leaned over his desk and lectured his spunky department chair. "Roger, you need to understand something. WSU is never going to be a great university. We're going to be a place where people pass through to achieve their best elsewhere. You've done a fantastic job developing these people—really you have—but you'll have to accept that." Breeze could hardly believe his ears. What the provost was really saying was that there's a cap on one's success, that one could go no further. And in America, no less!

"I told him, 'I have never heard so much bullshit in all my life.' " Breeze turned and walked out of the provost's office, feeling like he was back at Glasgow. He trudged back to his campus office, darting between waist-deep snowdrifts. He spied an orange slip of paper on the windshield of his car parked out in front of the quaint brick vet school building. "What the hell is this?" he yelled out. It was a $10 parking violation: Parking Without a Permit. "When it snowed," recalls Breeze, "they only brushed off the windshield on the driver's side looking for the permit." His parking permit had slid to the other side of the dashboard.

The ticket was enough to push Breeze over the edge. "I absolutely became unglued." Breeze stormed up to his office and resigned his chair. Previously, the USDA had asked him to run the Plum Island Animal Disease Center. He had responded by asking, "Are you crazy?" The gig came with a $20,000 pay cut, made worse by a cross-country move and a huge cost-of-living increase. Now he was the crazy one. Breeze renounced his British citizenship, pledged allegiance to the United States, and cast his lot with Plum Island, an island monarchy all his own. To Breeze, unless one's science was "the very best in the field," one's career was finished. He left WSU, taking with him the "entrepreneurial style" he perfected there.

"The whole management style I have is this—you have to go in, not just with money, but with resources." He could help the USDA deliver those resources at Plum Island. Or, as one familiar with Breeze puts it, "He could go up there and kick some ass."

When Roger Breeze arrived, he found Plum Island's laboratories "literally falling into the sea." Turning Plum Island into a gleaming new facility would take a tremendous financial effort, and money was unavailable. "Nobody said to me, 'Come to Plum Island and we'll pour money into it. . . . ' Washington thought the money they poured in gave them more of the same—the same science that wasn't good enough." The goal then would be to take Plum Island's small budget and stretch it as far as possible, to lure the best scientists with new lab equipment, and keep them happy once they arrived. "I told [USDA headquarters] we either have to do it this way or recruit only Czechs, because this place looks like Prague in 1956 and they'll feel right at home here." Meanwhile, the National Academy of Sciences, having excoriated Plum Island, said it couldn't be fixed and urged it be closed down. While Breeze spoke persuasively to the skeptics about how the island would turn around, privately he harbored doubts. He knew all eyes were on him, looking for his tenure to end in disaster. His first failure could very well be his last.

Taking over the Plum Island kingdom, Roger Breeze had put himself up against the proverbial wall. He had some snake oil to sell. The question was, could he sell it?

The first thing Breeze's "science first for glory" regime did was tear apart Plum Island's budget. Since the Army had left Plum Island in 1954, ongoing funding problems were par for the course. Dismayed over early cuts in his budget, Doc Shahan said, "The project may stand or fall, depending on adequate support in the beginning. . . . [USDA] cannot properly discharge its responsibilities without such a facility as Plum Island which is at present only an infant facing gargantuan tasks."

When Dr. Callis first took the reins in the 1960s, he too felt the money crunch: "For the last several years, the salaries of wage board employees have increased annually . . . [but] our budget has not been increased by an amount equivalent. . . ." **And in the 1980s, Dr. Shope's advisory board proposed Plum Island prepare two budgets—one outlining the costs of a mainland laboratory, and another showing the additional costs of operating a facility on an island, in an effort to sway Congress into properly funding Plum Island.** This way, Congress could understand why it had to fork over such large chunks of money to support functions as compared to research. Without the necessary funds, said the advisers, Plum's mission could be "jeopardized."

To raise Plum Island from its depths, Breeze first focused on where the money was going. For this, he needed a crack accountant, a brilliant numbers guy. Enter John Patrick Boyle, known as one of the best number crunchers in the business. An Irishman of medium build, with a frosty white beard, Boyle in his heavy Boston accent recalls Breeze's offer: " 'You'll have to build it up from nothing, John,' he said to me. 'It presents a real challenge.' " As they discussed the opportunity, something about the Scot (though he was really a north-Englishman, everyone thought him a Scot) captivated Boyle. He saw in Breeze a rarity in government service—a visionary with an ambitious plan, backed up with the enthusiasm and an uncanny relentless drive to carry it through. Boyle signed on.

Boyle's first visit to Plum Island was like something out of an episode of The Twilight Zone—to him, it was an eerie isle that time forgot. The once impeccably groomed and abundantly flowering "plantation" was now a wildly overgrown jungle. Paint had chipped off Lab 101's walls and huge chunks barely clinging on were flapping in the ocean winds. "Scientists were just sitting around doing nothing." Or at least Boyle thought they were scientists. "You couldn't tell the difference between a scientist, a tech, or the guy who swept the floor." The place had gone to pot—it was filthy and carried a rank, musty smell. The floors, caked with stains, hadn't been mopped in ages. On laboratory bench tops, which required an ultrasterile surface for virus research, Boyle spied dried soda pop, crumbs, and papers strewn about in piles. He took his index finger and swiped it along a pipe that ran along the wall, removing a quarter-inch layer of dust. "It was just ugly," says Boyle. "And everyone had the same attitude—'fuck it.' "

Plum Island was also a mess in other ways, especially when seen through the assiduously burning eyes of an accountant. "There was a lot of what we call indirect research cost [IRC]," remembers Boyle. "Scientific money that is eaten up by administration, support, building maintenance, grounds crew. And this side of Plum Island was essentially a Golden Cow." John Boyle explained how it worked during the reign of Dr. Callis: "Engineering would say, 'Well, we have this hurricane season, and we need [power] redundancy up here because we may lose a 50,000-kilovolt transformer that might go out on a Saturday night, when there's no one around.' They would use scare tactics like these, and add, 'Now if we lose that 50-KV transformer, then we lose power to Lab 101, we lose our negative airflow, and there's danger of what we have escaping out into the atmosphere.' And it would scare the bejesus out of management, so they'd say, 'Here, take this $75,000 and purchase a generator.' They dazzled them with footwork."

No longer would the tail wag the dog. **To Breeze and his man Boyle, the primary need was not support, but rather Plum Island's pièce de résistance, its holy grail: the science. Without science, there could be no glory. "The IRC was outrageous—it was 78 percent [of Plum Island's yearly budget] when we got there."** At a normal lab, Boyle says, it would be in the low twenties. To improve science and keep the island from being shut down? "Shave the IRC down to a bare minimum," says Boyle. No longer would engineering and plant management be the Golden Cow that got whatever it wanted. Boyle sharpened his pencil and got to number crunching, putting in late nights and seven-day workweeks, huddled over stacks of spreadsheets and financial data. With a stroke of his pencil, he slashed the animal supply contract and whittled down oil and new vehicle purchases. Next, he started counting up all the widgets—electric saws, toilet paper, circuit breakers, circuit boards, soap, hammers, nails, lightbulbs—and figured out where costs were coming from. "We bought thirty items, used twelve, and they reported six in inventory," he recalls. "People were carrying stuff off the island on Sundays, typical stuff people try to steal from the government— except here, they were doing it wholesale."1 He installed a phone switchboard that provided reports of outgoing calls. "The day after I announced that one, there were cries I was violating people's privacy." But it worked—the monthly Plum Island phone bill plummeted in just one month from $7,000 to $3,000.

"John, I am hiring a doctor and I need an X-ray crystallography machine," Breeze told Boyle early on. "It costs half a million dollars—now go find me the money for it." Coming up with that kind of dough stumped even the uncanny number cruncher, who had just completed chiseling together a budget. He tore the whole thing apart again and found Breeze another $500,000, securing a renowned doctor's transfer to Plum Island. "He was very demanding to work for," Boyle says, smiling fondly, relishing working on the Breeze dream team. "I had to pull a string here and there and unravel it all and put it back together—and of course I found the money." But from where had it come?

"If you watch the pennies," Boyle's parents had taught him growing up in hardscrabble Dorchester, an Irish Catholic inner-city Boston neighborhood, "the dollars will take care of themselves." Now he was watching nickels and dimes, too, and to Breeze's delight. "We cut a substantial amount of money," says Boyle. "We cut well over a million dollars." He believes even more could have been slashed. After six years on the job, says Boyle, "I still didn't know where all the waste was. There was still some shit going on that I couldn't put my finger on—which tormented me to no end."

With the budget in Boyle's capable hands, Breeze next brightened up the physical appearance of the laboratories, taking special interest in the toilets. "Nobody had cleaned these rest rooms—there would be no toilet paper, and the sinks were filthy. I wasn't prepared to live with people not doing their job.

Everything at Plum depends upon a handful of scientists who are pulling the train." At a minimum, those scientists had to have sparkling bathrooms, perhaps the most basic of all provisions. "I had to completely remove all of the furniture in the toilets because it was so bad—so dirty—it couldn't be cleaned." Breeze ordered brand-new porcelain, metalwork fixtures, shiny faucets, and gleaming tile, and refinished the rest rooms. Then he explicitly set forth the frequency and manner in which they were to be cleaned. He also conducted unannounced spot checks throughout the week to ensure full compliance.2 "It was a personal tour de force," Breeze gloats.

But that was only child's play compared to what he did next. Within a year, the new administration had become a lean and mean machine, deaf to the rants and raves of the support staff and their supposed needs.3 So when Walter Sinowski, the building foreman of Lab 257, told them in early 1991 that an emergency backup power cable needed repair, management had a different answer this time around: no.

Roger Breeze had become a slave to science.

Soon after taking over the reins, Breeze set out to acquaint himself with the island's three hundred daytime inhabitants. "When he first came in, we really thought he might be one of us," says one worker. **Whereas Jerry Callis wore a suit and tie to work each morning, Dr. Breeze scarcely looked like a doctor, let alone the director. Sporting a plaid shirt and jeans and smiling broadly, Breeze was slapping workers on the back as if they were old friends. Veteran employee Martin Weinmiller recalls Breeze coming ashore on his first day. Heading home after the graveyard shift, Weinmiller watched the ferry bearing the new director tie up at the harbor dock. "He walks off the boat, and looks out at the island for a time. Then he says, 'Either I'm going to make this place or I'm going to break it.' "**

Easing himself quite comfortably into the chair occupied by Dr. Callis for decades, Breeze quickly set the tone with employees with his newsletter, the Plum Island Diary:

- *I am sure that the last many months have been very frustrating and disheartening. . . . This Center is not going to close, we are not moving to another location. . . . Together, we are going to plan and build the next proud 35 years of our history.*
- *The impression potential recruits gain of [Plum Island] must be diminished by the shabby state of most of our buildings and grounds resulting from years of neglect—and I know that our loyal E&PM [engineering and plant maintenance] staff who have tried so hard to do so much must also be discouraged.*
- *If we complain about federal salaries, crumbling buildings, and bureaucratic inertia, it should be no surprise that people lost interest in working here. Let's be proud of what we do and speak positively wherever we can.*
- *Those with problems and suggested solutions can help me more than those with problems alone. . . . Thanks for your input in advance.*

The whispers began: *Hey, look out for this guy.* **When Jerry Callis looked out upon his island from his office perched over the Army parade ground, he saw an honorable band of three hundred loyal, dedicated employees. Breeze saw support staff and veteran scientists as a motley gang of serfs, a drain on science funds that did little more than punch the clock and collect an oversized paycheck.**

In Breeze's first big move, he fired three scientists and forced a fourth into early retirement. He called the African swine fever virus team from the lab to his office and told them they had two weeks to pack up and leave. They were dumbfounded. "We had experiments with years of work gone into them," says Dr. Richard Endris. "With Roger, there was no kinder, gentler way," said another source. The team complained to the swine industry and the local congressman that taxpayers' work was "going down the tubes." That bought them a six-month reprieve. But once that time was up, Drs. Endris, Jerry Pan, Gertrude Schloer, and their leader, Bill Hess—a forty-year Plum Island veteran—were out on their rears. "He's seen fit to change directions," the seventy-two-year-old Dr. Hess drily told a reporter, "which is his privilege."

In Breeze's opinion, the four scientists were repeating the same science, or as one Breeze official said, "Reinventing the wheel, over and over again," testing viruses on one tick species after another. Said the official of the sacked four, "They were the worst of the worst—one of them hadn't published a research paper in nine years. Another one hadn't written one in five years. Sat there on their dead asses leaning on their elbows. They knew it was coming."

Contrary to what others said, Dr. Endris and Dr. Hess had published scientific papers in recent years. **Breeze's reasoning that it was time for a genetically engineered vaccine for African swine fever made little sense to Endris, who says African swine fever antibody proteins (like Dr. Bachrach's VP3) just didn't have the prophylactic properties necessary. "[Breeze] did not understand the biology of it, didn't have the grasp of it— but he didn't let that get in the way of his politics."** Ironically, Endris was one of those few on Plum Island who thought Dr. Callis's departure might be a good thing. A new director could rejuvenate the crumbling laboratory and reinvigorate its mission, he thought. Now he knew just how wrong he was. "Personally, after I saw what replaced [Callis]," he admits fifteen years later, "I wish he had stayed."

Breeze then confronted the remaining scientists. Sitting them all down, he berated them with facts and figures—the number of test animals purchased compared to the number of scientific papers produced. The number wasn't nearly high enough and the few papers published were terrible. "This was really sad," Dr. Jim House would growl years later. "The part that's bothersome is that he tried to play down the accomplishments of those who had been there before him—not one time, but numerous times. He tried to make their accomplishments look petty."

There was another reason the scientists were pushed out—to make room in the budget for a new ferry.

MELTING SNOWBALLS IN THE ANTARCTIC

Just when it seemed like things were clicking into place—the budget being tightened, unwanted scientists pushed overboard, and new equipment for new scientists under requisition—the roof caved in. Or rather, the dock caved in. **The ubiquitous autumn storms that pounded Plum Island smashed the harbor dock to pieces. The $700,000 cost to replace the bulkhead blew a hole straight through Boyle's crafty budget and jeopardized monies earmarked for the new crystallographers, spectrographs, and electron microscopes.** Washington told Breeze that Plum Island had to pay for the repair, putting him in the unenviable position of reneging on promises to his recruits. Says Breeze, "That would be like telling recruits at Columbia University, 'I can't buy your scientific equipment for you, because I have to go fix a piece of West 168th Street.' They would look at you like you were crazy." With the dock standing in the way of scientific glory, he had to do something.

In its long history, the secretary of agriculture's advisory committee, made up of representatives from livestock industries, had never met outside of Washington, D.C. Breeze proposed to Washington that the committee meet this year in Old Saybrook, Connecticut, to see Plum Island. As a friendly gesture to their new exotic disease lab director, the aggies agreed to organize it—but on one condition: he would not, under any circumstances, ask the committee for money. "The Department was going to put $1 million into the island and that was going to be it—and I was not to ask them [for any more]," says Breeze.

They all came out one morning—the National Cattlemen's Association, the Pork Producers' Council, and the dairy and poultry associations— all the groups that had a multibillion-dollar stake in what some might label "corporate welfare." Plum Island had always been painted as essential to the American people—

wholesome, apple pie research to protect the food supply, defensive research that private industry just wouldn't do. But when the twenty dark suits crowded onto a boat bound for Plum Island with "Cap'n" Breeze, the scene looked less vital to the taxpaying public than to the billion-dollar agribusiness conglomerates the captain's passengers represented.4

In evangelical tones, Dr. Breeze walked and talked the group through the deteriorating laboratory, preaching how he planned to shore up its crumbling foundations, rid the place of the driftwood, clean the bathrooms, shine the floors, and bring science—glorious science. "He was very charming," says one observer. "So charming he could melt snowballs in the Antarctic." But meeting again the next day, the Pied Piper's smile had turned down at its corners. He talked hard and fast at them in his distinct accent.

"This place is never going to fly. You can't keep doing this business with the island falling down. We need $40 million here. We need it. I'm delivering the program, I'm hiring the people—but it won't work without $40 million." Breeze had previously been told by his engineers that it would cost about $25 million in total to repair the island into tip-top shape. He paused and looked at them, head cocked for effect.

"Now if you don't want to do it, that's fine—and we'll all walk away. No problem—I'll go find another job." But heads in front of him were nodding. We're with you, Roger, we are—we are!

They were. Thumbing his nose at his superiors, **Breeze had secured, in a matter of days, a construction program that Plum Island had failed to get under way for decades. The livestock groups got behind it, and leaned heavily on reluctant USDA officials and Congress to give way.** Though infuriated with their insubordinate new director, there was little Washington could do about it. How did his superiors respond? "Well," says Breeze, smiling, "everybody changes. If there was no money, it was all over, and they might as well have known that. You cannot make bricks without clay." Breeze soon had $22 million of clay in his hands ($3 million shy of his personal goal, but still enough) to build some 58,000 square feet of new space and renovate another 45,000 square feet. It was a truly remarkable feat.

Successful in dividing Washington officials from their industry advisory group, he trained his sights on the island, and on how to grab the animal kingdom for himself.

Long Island's North Fork was far too remote a place to attract good scientists, said Breeze. The cost of living there was far too high for government-salaried postdocs. Opportunities for spouses were also limited, except maybe to wait tables or work retail cash registers. As far as raising children, some scientists thought the school system fell short. "You'd have to go way up the Island to find any real sophistication," says one. And another, "The area is dead . . . it is not the type of place to attract young, upwardly mobile professionals. God knows how many miles you are from the nearest quality health care." Locals couldn't fill the scientific need, Breeze believed; they lacked the requisite education and experience. Recruiting would soundly fail. The laboratory would indeed fall into the sea, and with it would go Cap'n Breeze.

But there was a solution. By running a ferry across the Sound to Connecticut, Breeze could provide the scientists with a better place to live, one with a lower cost of living and better schools and real employment opportunities for spouses. At the same time, Plum Island would be connected with the Amtrak station there, allowing a link to universities like Yale and the University of Connecticut. "This ferry will turn Plum Island around," the new director boldly predicted. "It will help make us the number one research center in the world."

The Connecticut ferry's first customer was none other than Director Roger Breeze. He moved with his wife and children to a house in Cheshire. "I had to be on [the Connecticut boat]," he said. "It doesn't matter to me where I live. I just didn't think people would take it seriously without me being there." **{But Dr. Breeze didn't even attempt to live on Long Island. The director lived alone on Plum Island in an old Army barracks until his family moved east from Washington State and joined him in Connecticut. }** The ferry's heaviest load was a mere seven or eight passengers. Former ferry engineer Ed Hollreiser says the boat often ferried a single passenger. Once, one of the new scientists Dr. Breeze recruited (all of whom "chose" Connecticut as their place of residence) realized he'd forgotten an important book while en route to the island. The ferry was sent all the way back to Connecticut, where a deckhand went and fished the book out of the scientist's trunk and brought it back—to the tune of $400 in marine fuel.

It was an open secret that new hires must hail from the Nutmeg State. "Anyone that wanted to work on Plum Island at that time—even on support staff—had to be from Connecticut," says a worker. Among the scientists and support staff interviewed who ventured opinions on the ferry, all of them suspected Breeze's wife was the motivation behind it. They say she disliked the countrified North Fork, and the closest university teaching positions for her were miles away at Stony Brook. With its many colleges and universities, Connecticut offered far better opportunities for her and the children. While all of this may be true, the director's own motivations seemed far deeper than pleasing his wife.

As ridership on the Connecticut ferry increased, professional camaraderie at the laboratory began to decline. People were beginning to fraternize based upon which boat—and from which state—they hailed. The move "set up two classes on the island," said Ed Hollreiser, "[Breeze's] people from Connecticut and us peons from Long Island." **"I don't have a personal problem with him," notes Dr. Jim House. "But he caused a divisiveness between the New York and Connecticut people. He created the Connecticut people because to him, no one smart would live on [the New York] side**. But for forty years it had worked without it." Dr. Carol House agrees. "He would have conversations with people on the Connecticut boat that [the New York staff] wouldn't be privy to."

The ferry was a top-of-the-line, luxurious $1.2 million, 540-horsepower, 110-foot-long boat—but there were flaws from the start. Hollreiser said there were design problems with the engines, and the exhaust noise ran afoul of local town ordinances. "It was like they bought a Yugo," says a former worker. "The engines constantly blew up and it cost the government big dollars in repairs." When they finally got the leaky, noisy, shuddering craft running, it cost a hefty $100,000 a year to operate—a significant chunk of funds for a "cost cutting" regime to bear.

Dr. Breeze maintains that "[i]t had been difficult to fill jobs in the past," but nothing in the records indicate that local hiring over the previous four decades had been problematic at all. As veteran Fran Demorest wrote, "The professional staff moved to Long Island, bought or built homes, raised their families and used our school systems. These families joined in the many local community activities, services, churches, and other programs." Breeze's detractors, large and small, would always say the Connecticut ferry was a colossal waste, a sham, all the way down to the nifty uniforms he dressed the marine crews in. Even the local congressman decried the move. "It sounds like a total waste of money," snapped George Hochbrueckner, a Democrat representing New York's First Congressional District. "It sounds like a few people—including Mr. Breeze—decided they wanted to live in Connecticut. The taxpayers shouldn't be paying for this. . . . This does not make any sense to me." But the USDA had paid for it, and the congressman's objections were for naught.

Even had he tried, Hochbrueckner could never have reversed the ferry. Because **Dr. Breeze saw to it that undoing his Connecticut boat would be akin to unscrambling eggs. In a masterstroke, he did the one thing that would grant his new ferry perpetuity. He lionized the one man whose name was inextricably entwined with Plum Island, invoking in a simple step the potent feelings of a warm and distant past that instantly hushed would-be critics.**

He named the boat after Jerry Callis.

The opinions of two of his allies are enlightening. "Yes, it was Roger's idea," says John Boyle, when asked who named the Connecticut ferry. "In my heart of hearts, I would never tell you what my honest opinion of that particular thing is. There are still a few things about him I can't quite figure out. He can be inscrutable—even to his closest friends."

The definitive word comes from Dr. Breeze's dear friend Dr. Robert Shope, with whom Breeze had lived after he legally separated from his first wife.7 "He lived in Connecticut and wanted the ferry for himself. The excuse was that it would bring in a broader group of scientists—and it was a very controversial move." What did Shope think of the naming of the ferry? "It was very clever," Shope mused. "The J. J. Callis—he had it painted on the boat before anybody knew it—[after that] you couldn't take the boat away and nobody could counter the move." [...]

DIVIDE AND CONQUER

By this time, in the words of one observer, "[Employees] were praying that Breeze would die and Callis would come back." No longer was Dr. Breeze the rustic faux Scot, turned backslapping American cowboy. He now charged around the island with a flashy imperiousness. Says a retired Plum Island engineer, **"You know, a lot changed when Breeze came in. He seemed real worried about climbing the ladder. He could care less about us Americans—or American labor, for that matter. The island was all for his own benefit. I remember one time, he was coming over on the early morning ferry, and we'd been coming off from the night shift. He shook his finger at Walt [Sinowski, Lab 257's building foreman] and said, 'I'm gonna get your job. I'm gonna have your job one day. It's not long now. Not long.' "Meanwhile, Walt had been retired already from another job, and working at Plum was something he was good at and enjoyed doing. Walt said to him, 'You can take it right now, Breeze. Go right ahead.' We'd sit there and take that crap from him, day in and day out.**

"And then one day—it happened. It really, truly happened."

The A-76 federal privatization program had visited Plum Island two times since its inception in 1980. The rules stated the government had to step aside when the private sector could perform the government's nonprofessional tasks, provided no "overriding factors" required the government to keep those functions federalized. On both previous occasions, Dr. Callis invoked the "overriding factors" exception and staved off privatization, arguing that Plum Island functions were far too sensitive to be contracted out.

Placing two high-hazard biological containment laboratories in the hands of a private company would shift the emphasis from safety to profits. And it would kill employee morale. Why take the chance? Plum Island remained under federal control. Until Dr. Breeze arrived.

In 1988, a year after Breeze took control, a performance work statement (PWS) was prepared. This was essentially a chart of all the tasks that private contractors (and the government's own "in house" team) would bid on. From the start, there were signs that the PWS was prepared incorrectly.

In an internal memorandum, the government review panel noted "many misleading statements concerning the real situation with underground storage tanks, existing fuel spills, the chemical management program . . . etc." The panel said the PWS had been "sugarcoated" and charged it did "not reflect the reality of the true pressing problems" at Plum Island. It seemed like the PWS was being rigged to lure an unsuspecting outside contractor into snatching the bid.

"It was a political decision to do it," Dr. Breeze says today of the Plum Island privatization. "It had nothing to do with me or anybody else in USDA—that's just the way it is." But at the time, responding to the review panel, Dr. Breeze exploded. "There are no misleading statements," he wrote. Instead, the panel had "misunderstood several issues. . . . There are no obvious deficiencies we know of. . . . If [the review panel] feels this PWS is 'sugarcoated,' I am very willing to make their specific concerns known." Definitive words from someone who supposedly had nothing to do with it.

On Thursday morning, February 21, 1991, four sealed envelopes were opened in Washington. Burns & Roe Services Corporation of New Jersey was awarded the five-year Plum Island contract, with the lowest and best bid: $16.3 million. The government's in-house team had bid $23.7 million on the same exact PWS. The private contractor had underbid the in-house bid by $7.4 million—more than 30 percent lower. The disparity meant one of two things. Either the private contractor grossly underestimated the costs of the Plum Island project, or the in-house government team engaged in the unfathomable: it tanked its own bid.

Breeze explains his point of view. "There is no secret to this. There's no way you can shuffle cards around, if you are giving people decent jobs with full medical benefits and all the other benefits that accrue with having a job with the federal government. You cannot compete with people that are being paid minimum wage, with minimal benefits—it's not possible. It's actually not something I agree with. I don't think it's the right thing to do by any means. But that's the process."

Breeze says the two bids during the Callis regime beat the private bids because they combined tasks. Those bids said: "Firefighters would act as janitors, and take away the garbage and clean the toilets and mop the rest rooms . . . the boat crew will maintain motor vehicles, and et cetera. And if that would have been clear up front, that firefighters weren't going to clean rest rooms, there would have been janitors and the government would have lost." John Boyle, who admits he was "heavily involved" in the privatization process, said, "You have to be really, really creative to have the government submit the winning bid. We put together a good bid—a competitive contract. To preserve it, [the union] had to give something up, and they didn't want to give up some jobs. I was quite frankly afraid we were going to win it. I didn't want to win it."

Most Americans instantly recall exactly where they were and what they were doing at the moment they heard President John F. Kennedy was assassinated, or that the space shuttle Challenger had exploded. For Plum Islanders, May 3, 1991, was one of those days.

John Boyle recalls the moment he heard Plum Island would be privatized for the first time in its history. "I was sitting in my office, staring out on the lawn, out on Gardiner's Bay, just daydreaming for a few moments, when Ernie [Escarcega, Breeze's facilities manager] calls me and says, 'A-76 is coming in!' And I thought, 'Well, thank God.' I personally considered it a blessing. . . ." Walking out of his office, Boyle saw men wringing their hands and women crying in the hallways. "Crestfallen is way too mild a word. For these people, it was like getting news your son was killed in a car crash. I am not overstating it, either." Dr. Breeze also remembers the scene. "Chaos—it was the first time any of the employees had an inkling they might really lose their jobs."

Seizing the moment, the very next morning Burns & Roe executives called an all-hands 8:00 a.m. meeting in the old Army chapel. Exhausted, Stanley Mickaliger had just finished an eight-hour graveyard shift in Lab 257 and trudged over to the chapel. "When I got to the meeting hall, they were already introducing each other, giving all these speeches—all these men with suntan lotion on all over, you know? It clearly wasn't the government anymore. They were these big contractor types." As the crowd slowly filed in, they were handed sealed envelopes holding the documents that determined the fate of their

careers. Mickaliger walked over to an official-looking woman for guidance. She told him they were not taking questions, not now—"You have to catch the ten a.m. boat because we're not going to be paying overtime anymore. You can look at your letter on the boat."

Shunted onto the ferry, Mickaliger and the others tore open their letters. "It had all this information, on a bunch of papers, but I didn't understand a lot of it." One thing was clear, though—he'd been fired. And the severance package was nil. The fifteen-year-veteran's remaining choices were a bit limited. "I could have went to Calverton [National Cemetery, a nearby federal facility with openings], but that wasn't my cup of tea. See, I had been a master plumber for forty years. Now I'm going to dig graves and bury people? My wife and I lost our health insurance at age sixty—I had to pay 102 percent of the cost. The letter said if I retired, I got only 40 percent of the eligible Social Security benefit I paid into all those years. I remember complaining to them, saying, 'Hey, I know guys here have thirty years in. But I've put in a good fifteen years—do you think you can help me?' They gave me COBRA for six months."8

The days of "respecting personal dignity . . . recognizing work achievement . . . providing work security" were over. So was the old feeling that working on Plum Island was like being part of an extended family, that it was a career. For the roughly one hundred support workers left behind (which would decrease to seventy-five by 1995), employment at the Plum Island exotic germ laboratory would now simply be a job. And thereafter it would have all the dedication to mission, attention to detail, pride in workmanship, and camaraderie that accompanied a job.

A newspaper editorial published at the time captured the moment: "How would you feel if you worked for somebody for 15 years and a new boss came in and told you that you were losing your seniority and most of your benefits? What's more, you will be paid half of what you were paid to do the same job and your annual vacation days will be reduced from 25 to zero in the first year." And that was only if the contractor kept your position—" Remember," says one employee, "those that were allowed to stay were offered 'a' job, not 'your' job." And those were the lucky ones. A deeper sympathy was reserved for the seventy-five or so that were fired or pushed off the island into the bitter seas of early retirement. The negative effects on the community of the privatization layoffs at Plum Island, the east end's largest employer, were real.9

Even the USDA grudgingly admitted it had been a "challenging transition period." A former Plum Island official described the transition with a bit more flavor. He calls it "the biggest clusterfuck you ever saw in your life."

Like he did with the ferry debacle, Congressman Hochbrueckner complained again, saying privatization "was handled poorly. The workers were treated shabbily." For a politician who publicly bemoaned the woes of Plum Island numerous times, he accomplished surprisingly little. Says Dr. Breeze of Hochbrueckner's rants, "He said, 'I'm going to block it,' and that was just disingenuous at best. He knew quite well the way privatization worked. He knew exactly what was going to happen."

The congressman wasn't the only one feigning powerlessness. "I wanted the government to hold a series of meetings where you explained to the workers the process under way," explains Dr. Breeze. "Absolutely nobody would do that and it wasn't up to me to do it. I actually couldn't get it done." Those meetings never happened. Breeze says he had nothing to do with the privatization or the transition, though the record clearly indicates the opposite. He could have, like Dr. Callis before him, warded off the A-76 guillotine by invoking the "overriding factors" exception, based on the island's unique risks and unfathomable dangers among federal facilities. After all, Plum Island was no run-of-the-mill federal office building, where you'd apply for a passport or pick up a Social Security check. "When Dr. Callis was there, we had the rigid safety standards that almost made it impossible for the contractor to bid," says a longtime Plum Island scientist. "And they could have applied for an exemption this time around, but they didn't."

Retired Plum Island scientists Drs. Jim and Carol House believe without question that Breeze had the power to halt the privatization steamroller. "He could have stopped it, prevented it," says Jim. "Oh yeah, absolutely." Carol adds, "The next time [privatization] came up, [Breeze] threw in all of the inside support services, so it became a big enough 'plum' to bid on—he reengineered the [PWS] so that more was included. He personally did that." "We said from day zero that this is a place that should not be contracted out," continues Jim House. "It can't be—there are just too many concerns." Despite their beliefs now, Plum Island scientists remained silent, instead of speaking out to fight the process. As a result, many of the support workers, says union leader Ed Hollreiser, felt betrayed.

As one employee said, "All it took was the swipe of a pen" to prevent Plum Island from being contracted out. But Dr. Breeze kept his pen in his pocket protector.

[...] John Boyle [...] felt at that time [...] that getting into the private sector would [...] "get rid of the riffraff , and it would run more efficiently for less money." **The USDA, indeed, trumpeted the Plum Island privatization.** They said contracting out to Burns & Roe would save taxpayers $1 million a year, and that support costs would decline by $5 million, or 20 percent, over the length of the contract.

[...] Later, it would be learned that the PWS grossly underestimated the required material and manpower to run Plum Island.10

After Burns & Roe came in, John Boyle was let go, the contractor having no need for his services. But eight months later, the contractor begged the financial wizard to come back because things were spiraling out of control. When he returned, Boyle didn't find a mess—he found nothing. "They had no accounting system to speak of. They had hired a bookkeeper who did not know what cost accounting was. I built a new accounting system there, from the ground up." And when he finished his task, he delivered some bad news. "They were over $1 million in the red. I knew about it two or three weeks before, when I started seeing the signs, and I was thinking, 'Jesus, this isn't going to turn around.' They wanted to shoot me."

In most organizations, taking out the trash, tending the grounds, mowing the lawns, and providing clerical support seem like responsibilities that should be handled by a contractor. But Plum Island is not your typical institution. Positions like firefighters, security guards, ferry operators, engineers, incinerator operators, ventilation system operators, electric operators, nitrogen freezer caretakers, power monitors, and sewer decontamination plant operators hold seriously heightened responsibilities. At the home of the most dangerous germs known to man, even the grounds crew and typists must be specially trained and abide by complicated guidelines. Ed Hollreiser comments, "My take is that management was so poor, contracting out would be an easier way to go. This way, they could yell at someone now besides themselves. They could hold [a contractor] accountable and blame them for all the mishaps."

A USDA laboratory in Ames, Iowa, was also put out for privatization at this time. Though the Ames lab houses far less dangerous germs, the staff there, surprisingly, remained under federal government control. And it remains in federal hands today. In August 2003, Iowa Senator Tom Harkin fought off a renewed push to privatize Ames by introducing legislation barring non-governmental workers at the laboratory. He called Ames's research "a vital function of the federal government, and it should remain the responsibility of federal employees." There seems to be no other reason for this glaring inconsistency between the two laboratories than the personal wishes of a director looking to slash nonresearch costs and yoke his workforce. Breeze muses, "It's sort of surprising that Ames hasn't gone out to a contractor. I think it will eventually go to a contractor—it's just a push that various administrations do to different degrees."

Privatization resulted in federally trained, highly skilled workers with decades of experience being bartered away in exchange for a cost-cutting, efficiency-

driven private contractor. But on paper, it looked good, and the credit redounded to Plum Island's director, Dr. Breeze. Most important for Breeze, it freed up more funds for science, his primary goal. At least that's how it was supposed to go.

Back in 1965, Jerry Callis described his island laboratory at an international conference by saying, "Safety is uppermost in our minds in everything we do." If that meant less money for science, then so be it. Some three decades later, costs, not safety, were uppermost in management's minds. With the support staff slashed by 40 percent, and the Breeze team cutting every support line item, some other details—like biological safety and security—were compromised. For starters, the two-day Plum Island orientation course, after which new employees were ordered to study a three-inch-thick safety manual as if it were the Bible, was now boiled down to a forty-minute VHS tape and a two-page flyer. The "Nothing Leaves" policy was abandoned. Vehicles and items trafficked among the two laboratory buildings, Long Island, and Connecticut without being decontaminated at all. Contractors, who once had to be escorted ("The escort had to take a shower with these men, take their cigarette breaks with them, even go into the bathroom with them," remembers one), now roamed free.11 The color-coded badge system was discontinued, and the identification num- bers disappeared. Against the advice of an outside consulting firm, the fiveman full-time professional fire department was converted to one firefighter and a bucket brigade of volunteers.12

For years, security on intruders was "like white on rice," as one veteran employee describes it. The once thirty-four-man-strong armed guard platoon—checking off ID numbers at the ferry dock, manning the lab compound gatehouses—was dispensed with. One "safety technician" now stood in place of all the guards. He wore an empty gun holster to scare away intruders. One of the fired security guards, Phillip Zerillo, told a reporter there was "a total disregard for security. . . . The place is just going crazy.

It's running by luck now." Today it's no different. "You could walk onto that island right now," says an employee. "Two Eskimos in a kayak could invade and take Plum Island."13 There are two private security firm guards, one at Orient Point and one protecting all of Plum Island. The U.S. Coast Guard patrolled the island's surrounding waters until 1977, when it decommissioned the Plum Island Lighthouse. **After a brief Plum Island detail following September 11, 2001, Coast Guard cutters again retreated, leaving Plum Island without any marine patrol.**

An internal memorandum dispensing with and erasing away decades of safety closed on an bizarre note: "We welcome any and all suggestions, recommendations, criticisms, and attaboys . . . as well as fishing tips, a good joke, and restaurant recommendations."

In perhaps the most egregious of the safety lapses, the sentinel animals, Plum Island's "canaries in the mine," were eliminated. These test animals were kept outdoors and tested periodically to ensure no germs had escaped the lab. Said a USDA safety director of the move, "From a biological safety perspective, the best thing that ever happened to Plum was the discontinuation of Animal Supply," because he believed it eliminated the threat of disease transmission. But it also eliminated the island's last line of defense.

After all, they had successfully alerted the Plum Island scientists to the virus outbreak. Having the control animals outside "keeps you honest," says Plum Island scientist Dr. Doug Gregg. It was akin to a mother removing the smoke detector from her baby's bedroom. The laboratories, now more than ever, became ticking time bombs and the public, unknowing sitting ducks.

But one thing remained clear: the new way was certainly cheaper. And the cost-conscious attack on safety soon became literal—the Plum Island biological safety office itself suffered. First it was divided into contractor safety and government safety. Then contractor safety was eliminated, and the government safety department was slashed down to three staffers. The money saved went toward recruits' salaries and their new scientific equipment, and amenities like touring bicycles and a high-tech exercise gym.

Veteran scientists became concerned over the hacking away of four decades of carefully thought-out biological safety procedures. Former Plum Islander Dr. Ronald Yedoutschnig told a reporter, "When I was there, every person on the island was the same. But today, there are fewer permanent employees. I would be more safety conscious because the [new] people are less safety conscious. The agents we are working with are highly infectious." Says Dr. Richard Endris: "When I was there, the safety was good. Now when it went from a system that is based on employee loyalty and integrity to one of the lowest bidder, I was very concerned that safety would be compromised. Little things, like the backup power generator going out during a storm. The redundant systems are the absolute key. You have to maintain air pressure, the airflow, the freezers. . . ."

Dr. Gregg ponders what privatization has wrought upon the island's morale. "Morale is not as good," he says. High turnover in the workforce contributes further to the problem. "The contracting out was a major blow to the unity of the island," says Dr. Jim House, "and it's still a problem today. A lot of the esprit de corps with the people is gone—they're not there for more than a year and there's a turnover. The turnover after two, three years had 90 percent of the people gone—people that had been there for years." Unfortunately, low morale often translates into poor performance on the job.

The USDA should best be able to assess Plum Island's safety. Out of a possible 100 points under rating system, the USDA scored Burns & Roe, the contractor they chose to run Plum Island, 54.3, 43.9, and 60. The score of 60 was the minimum acceptable performance number.

Sometimes poetry captures the human condition better than prose. Plum Island Lighthouse keeper Captain William Wetmore penned "Plum Island" in the mid-1800s:

- *There is a rock-bound Island off Long Island's shore;*
- *Where you hear the music of the Ocean's roar.*
- *There you see a light-house on a rocky bluff—*
- *Tides there a roaring, surging; waters sometimes rough.*

One hundred and fifty years later, this line and verse was pulled from a file in Lab 101:

- *What in the world's going on over there;*
- *We heard that there is a "new Breeze in the air."*
- *Who denounced the achievements of thirty-some years;*
- *And announced that a time of success would appear.*
- *Just what has he done in three years on the job;*
- *See those new scientists that fancy boat bobs.*
- *Back and forth, forth and back to Connecticut and*
- *Of course the new carpet has served to expand*
- *USDA's credit both here and abroad;*

- *That use of our taxes we can all applaud.*
- *It seems that there's only one thing to say:*
- *That new Breeze just may blow Plum Island away.*

One employee summed it up more succinctly: "Breeze? "Breeze was a fucking doomsday machine."

212-215

THE BREEZE SUBSIDES

Dr. Roger Breeze left Plum Island in 1995 for a better career opportunity.

His two predecessors had been honored by the ferryboats M. S. Shahan and J. J. Callis. "They won't need a boat to remember me by," Breeze told a Newsday reporter who asked him about his legacy. He was even more direct with me when we spoke. "My memorial has to do with the people I got there. I'm not interested in any damn boats and buildings. Facilities and boats don't do the research. People do. You can set out a stack of my scientific papers, and I'll be judged by those. I come back to this—it's the glory at all levels, and not in a negative kind of way."

Roger Breeze drew responses out of people, whether they were his superiors, his scientists, or his support workers. A head Washington-based USDA official said, "Some people just think he's the best—and some don't." From that distant official's vantage point, Dr. Breeze was "innovative and dynamic." He had reworked Plum Island's entire scientific program, rebuilt the facility, and saved Plum Island from imminent demise.

Ed Hollreiser sees Breeze as a "strange guy, very cunning—he'd call me in for little chats and tell me things that he said he didn't wanted repeated, but he really wanted me to spread the word." Plum Island safety officer Tom Sawicki says, "Breeze was here for a reason, he did what he had to do, and a lot of people didn't like it." Fran Demorest says, "It was his steppingstone.

And he made enemies there."

Dr. Robert Shope, who had lived with Breeze for a time in Connecticut, takes a middle view. "He did some things that weren't too popular with his superiors at USDA. And he may have gotten rid of some people at Plum who were deadwood, and in that sense, he wasn't very popular. But I think he was part of the driving force of the island." When asked to compare him to his predecessor, Shope thought of Breeze as "a totally different type of person—and still is. He's a wheeler-dealer type, and Callis was very conservative and played by the book and that sort of thing. Just two different people."

"My problem with Roger," says Dr. Carol House, "is that he still has an influence. He still shows up at town meetings and stands in the back, hovering. He still has a large influence over there, and he has pulled potential [Plum Island director] candidates."

"Roger's very hard to talk about," Dr. Jim House says, slowly, measuring his words. "Not one of the brighter moments in Plum Island history.

Roger had a way of manipulating situations so he was always politically on top. No matter what he did, he would come out smelling like a rose. He was very, very clever.

"He did make strides, enhancing the amount of molecular virology done, but he even took that to an extreme. He was somewhat of a visionary, and he's into biological warfare, his new thing now. But he didn't have the vision or skills as a manager to run Plum in a smooth and productive manner. I didn't have a lot of respect for him scientifically. He was selling genetically resistant animals, and we didn't do genetics of animals. We had this genetically resistant cow, and transgenic pigs. Of course that never went anywhere.

"A lack of perspective—of all the things you'd say about him, that would be the one—a lack of perspective."

The two research groups at Plum Island are without question the best of their kind in the world," boasts Dr. Breeze, "and that wasn't true when I went there. If there's one thing I do know about very, very well, it's how to motivate scientists to go beyond what they think they can do—that's what I do best." But in some cases, the science on Plum Island may actually have been set back. Proof of that, says Dr. Richard Endris, is that some three years after the four scientists had been dismissed, one of Dr. Breeze's new recruits reestablished and set up—from scratch and at great cost—the same African swine fever tick colony research that Breeze disbanded upon his arrival. As for the new laboratory facility, it included a new animal isolation wing, and a fancy sandstone two-story brick office complex slapped across the front of Lab 101. The brown brick and shiny glass façade conceals the deteriorating 1956 laboratory facility behind it.

Retired from government service, John Boyle still follows the career path of his old boss. "You saw what happened after Roger left Plum Island—he became an associate area director, he then became an area director. Now he is a big-time guy in Washington." Dr. Breeze is the associate administrator for "special interagency programs" for Agricultural Research Service. With his boss, Floyd Horn, at the Department of Homeland Security, Breeze oversees a good part of the USDA's scientific research.

Undoubtedly, the steep trajectory of his career path in America trumps the sluggish thirty-two-step ladder he left behind at Glasgow University.

Is it possible that Dr. Breeze was blinded by his own ambition? "He is a very talented guy, and cares very deeply," says Boyle. "I think he cares so much that maybe it even overrides his talent, because he is so tenacious, once he sets out to do something, it will get done. But he really cares about science—good science. It's why he took a liking to me, because I worked so hard to get him the ferryboat." Blinded by the glory of science, or blinded by unadulterated ambition—or perhaps both—Dr. Breeze's curriculum vitae soared while the people of Plum Island tumbled and the island itself crumbled.

In the wake of that unbridled progress, people's lives changed, and not necessarily for the better.

"If this place wasn't going to be different," Breeze told a reporter, reflecting on his tenure, "it was going to be gone."

For certain, Roger Breeze had made Plum Island different.

"Living with success," he says, "is harder than living with failure."

CHAPTER 14 : The Homeland

219 - 221

Unfortunately, this story doesn't have a happy ending where the troubles work themselves out into tidy solutions. In fact, there is no ending. The island workforce walked out and went on strike in August 2002. The following June, President George W. Bush moved the laboratory from the USDA to the new Department of Homeland Security.

The Plum Island saga gets more intriguing with each passing day.

Dr. Breeze physically departed Plum Island in 1995, but he continued calling the shots from his new office in Washington as a procession of faceless directors came and went. Breeze finally got his man in sixty-five-year-old Dr. David L. Huxsoll, whom he appointed Plum Island's director in June 2000. "Roger handpicked him," says one scientist familiar with the decision. "He has that biological warfare background that Roger likes. Breeze has always been into germ warfare. He loves the mystery, and the intrigue—he's really into it." Dr. Huxsoll grew up on a farm in the rural town of Aurora, Indiana, where he recalls being so attached as a child to his family's livestock, he cried for days when the fattened baby calves he had named and petted were sold at market. Like Dr. Callis, Huxsoll attended Purdue University, but the comparisons end there. After a brief vet practice stint in northern Illinois, Huxsoll was drafted into military service and embarked on a threedecade military career chasing diseases around the globe. Colonel Dr. Huxsoll was named commander of the Fort Detrick biological warfare laboratories in 1983, the first veterinarian to hold that command, bringing full circle the veterinarian connection to biological warfare that Plum Island founding father Dr. Hagan began in 1941. "The most valuable thing out there," says Dr. Huxsoll, "it's not the gun, it's not the tank, it's not the jet fighter—it's man. So we do whatever can be done to prevent illness, and should illness occur, restore that person to operational status."

As Fort Detrick's1 commander, Colonel Huxsoll saw heavy action during the now-infamous Ebola virus outbreak in Reston, Virginia, featured in Richard Preston's The Hot Zone. He made the controversial decision to send the Army into a domestic matter that the Centers for Disease Control (CDC)—lacking any hands-on expertise—was having a difficult time managing.

"At that time, I considered everything, the potential hazards, and the safety issues. . . . There comes a point in time when you see—and you know—the only logical response is to make that uncomfortable decision with the best interests of lots and lots of people in mind." The decision was the right one. Huxsoll's well-trained medical soldiers—led by virus hunter C. J. Peters, who stalked Rift Valley fever through Egypt a decade before— successfully beat back the Ebola virus.

After the 1991 Persian Gulf War, Huxsoll served on three U.N. biological warfare inspection teams in Iraq, leading two of them. In Iraq he interrogated directors and middle managers of medical and academic facilities like the University of Baghdad and the College of Agriculture. As with the United States, following the veterinarians revealed clues about germ warfare.

Says Huxsoll, "Probably the greatest capability in addressing the biological villains, and those having a true understanding of it, was at the veterinary vaccine places." Special military satellite image maps enhanced by computer line drawings afforded the inspection team an uncanny recreation— down to exact shapes and sizes—of each suspected germ weapon manufacturing plant. Among the long sheet maps Huxsoll unfurled in front of his impressed Iraqi hosts ("I think it got to the point they probably thought we had more capability than we really did") was a single-cell protein facility at Al-Hakam. Ostensibly, that operation grew colonies of bacteria in big fermenter vats to be dried and milled into high-protein animal feed. But the team discovered a fair amount of evidence that it was used for biological agents, and ultimately the Iraqis admitted it. It wasn't easy to determine, however. "The plant that would produce biological agents for weapons purposes," Huxsoll notes, "may not look too much different from the plant that produces biological agents for vaccine purposes or for making beer." Chemical agents are another story. Chemical plants have what is

called a large "signature," while biological facilities have a far smaller footprint.

"If you're going to dump chemical agents on a significant portion of Long Island," Dr. Huxsoll postulates, "you have to have tons of the stuff.

Now, in the case of biological [agents], you can measure what you need for the same area on Long Island in kilograms, not tons. That's because you can disseminate them in an aerosol, and if you are good at this, you can spread it over a huge distance." Following those tiny footprints all throughout Iraq, Huxsoll's teams uncovered volumes of anthrax, botulinum toxin, ricin, gas gangrene, and other anticrop and antilivestock germs being prepared and weaponized on the tips of bombs.

[...]

In its final battle, Pat Acampora's task force faced down mad cow disease.

At an early morning meeting in Acampora's office, with Dr. Breeze present, USDA officials were asked if Plum Island had ever studied bovine spongiform encephalopathy, better known as mad cow disease. This animal infection's human variant, Creutzfeldt-Jakob disease, gnaws away at brain tissue and has a 100 percent mortality rate. {4Mad cow disease and Creutzfeldt-Jakob disease are caused not by live germs, but inanimate "prions," freefloating snippets of infectious DNA material that lack the structure that characterize viruses and bacteria. More resilient than any known germ, they resist the decontaminating processes of steam autoclaving and even incineration. Little is known about prions, but they are known to be extremely dangerous to animal and human life. } The Plum Island officials told the group they had not worked on mad cow and weren't equipped to study it. But a few months later, when 255 sheep in Vermont were suspected of contracting mad cow, the USDA made plans to ship the carcasses to Plum Island for necropsy, tissue and blood samples, and incineration. Tipped off of the plan, Acampora went livid. When she confronted Plum Island about it, the USDA told her, "Well, the situation has changed." "They don't even have a state permit for their incinerator!" she roared, and threatened a showdown: if they carted the sheep carcasses through Manhattan or Connecticut onto Long Island soil, she would get the police in Nassau and Suffolk counties to barricade the roads.

Fearing a public relations debacle with national implications, the USDA backed off, and trucked its infected sheep refuse to the Ames, Iowa, laboratory. "It became such a hassle, they decided not to do it," Acampora recalls with modesty; the truth is, she was the hassle. So many others— politicians, media, community groups—had failed over the years in trying to fight Plum Island. Finally, the task force had won a battle. It was a start.5

"Look at our space shuttle," Acampora says. "We spent billions of dollars on the space mission, hundreds of engineers, technicians, scientists, and safety experts to make sure the flight was fail-safe. We watched in awe. We clapped. And then it exploded in horror. That's what I'm worried about."

Even to this day, while other local officials have accepted tour invitations, the feisty assemblywoman won't go to Plum Island. Why is that? "It's really a simple reason," she laughs. "They say that when you go there, you have to scrub down, and get all washed up. And no one's going to see my hair wet." One gets the impression her fears go far beyond a bad hair day.

"There have been a lot of mishaps out there," she says, "and let's face it— Long Island has a lot of wind, and should something happen there, and the wind's blowing in the wrong direction, that could be pretty problematic.

"When you are a mile off the coast of a heavily populated area, an area for which we have no real evacuation, I have a concern." Indeed, there is only one arterial road off the North Fork and one out of the Hamptons, spilling into the heart of Long Island. From there, Long Island's 7.2 million people bottleneck into ten narrow bridges and tunnels that themselves empty into the cluttered congestion of New York City, where 11 million more people reside.6 Indeed, Plum Island lies on the periphery of the largest population center in the United States.

"You know, a lot of people really don't know Plum Island even exists,"

Acampora muses as her smile fades to a smirk. "People move here from New York City, they come here, play here—and they have no idea what's going on one mile off the coast."

William Bremer (born 1863)

https://www.kuow.org/stories/bremerton-wouldnt-exist-without-seattleite

2017-02-npr-kuow-org-bremerton-wouldnt-exist-without-this-seattleite.pdf

William Bremer, born in Germany, moved to Seattle first.

But it was Bremerton, the city across Puget Sound, to which Bremer "gave his name and his fortune and all of this thought and energy," according to Leonard Garfield, director of Seattle's Museum of History and Industry.

Around 1890, Bremer learned that the U.S. government was scouting land on the west side of Puget Sound as a site for a Naval shipyard. Bremer was just one of a number of speculators who tried to cash in on the opportunity, "but he ended up by far being the most successful," Garfield said.

Bremer had a banking background and a brother-in-law who'd made money as a jeweler, so "he just went over there with a pretty hefty checkbook, figures out where the Naval station might be, and buys up everybody's property."

Bremer didn't just have a chunk of land, though.

He had a vision for a town. Bremer saw shipyard workers would need food, and shelter, and places to congregate. So he platted the land, named it Bremerton, and began dreaming of what it would be. "He thought that there would be a metropolis on the other side of the sound. And it would all revolve around this enormous federal investment," Garfield said.

The town did grow, but not necessarily how Bremer imagined. One thing Bremer didn't seem to anticipate, says Garfield, is that the Navy would bring not just renters and customers, but also drinkers and brawlers. "He was probably overly optimistic that it would be a normal apple pie American city," Garfield said.

Bremer himself never moved to Bremerton. He lived with his family in Seattle until his death in 1910 at the age of 47.

```
"A Volume of Memoirs and Genealogy of Representative Citizens of the City of
Seattle and County of King, Washington." New York and Chicago: Lewis Publishing
Co., 1903.  p. 278.

WILLIAM BREMER

     So composite is the social fabric of our republic that we can as yet
scarcely be said to have developed a national type, and among the many elements
that have entered into the makeup of our populace there is none which has been
of more vital and valuable order than the German, from which America has had
much to gain and nothing to lose.  From the great German empire have come many
of our most progressive citizens, men of sterling worth of character and endowed
with that pragmatic ability which has promoted advancement along all lines of
material industry and has ever stood for social stability.  Among the
representative young men of German birth who have attained distinction in
connection with the industrial life of the state of Washington is Mr. Bremer
```

connection with the industrial life of the state of Washington is Mr. Bremer, who has maintained his home in the Puget Sound district for the past fourteen years and who has attained marked precedence as an able and enterprising business man, one who has contributed in no small degree to the work of development and improvement through legitimate lines of endeavor. He is well deserving of representation in this publication as one of that progressive type of men who have made the Evergreen state what it is to-day. He is the owner of the town site of Bremerton, was one of the founders of the village of Sidney and through his real-estate operations and well directed enterprise has done much to forward the material development of this section of the state, maintaining his home and business headquarters in the city of Seattle, where he commands unequivocal confidence and esteem.

William Bremer was born in the town of Seesen, duchy of Brunswick, Germany, on the 12th of June, 1863, being a son of Edward and Matilda (Mader) Bremer, representatives of stanch old families of the German fatherland. Edward Bremer was a man of prominence in his locality, having been engaged in the banking business and having attained considerable wealth and exercised notable influence in local affairs. He passed his entire life in his native land. He and his wife became the parents of eight children, of whom the subject of this review was the fifth in order of birth. He received his educational discipline in his native land, having completed a course in the Jacobson Institute, at Seesen, the same being an institution of more than national reputation. In his youth Mr. Bremer became identified with the banking business, which he learned in all its details, this training having proved of inestimable value to him in his subsequent business career. After serving what may be termed as apprenticeship in a banking house in his native town he went to the city of Hamburg, where he was identified with a similar line of enterprise for a period of two years. When in his twentieth year Mr. Bremer bade adieu to home and native land and came to America, whither his elder brother, Charles E., had preceded him, being now a prominent capitalist and business man of Aberdeen, South Dakota. Our subject passed about one year in Minnesota and the following three years were spent in South Dakota. When but twenty-one years of age he was appointed state agent for the Jon Gund Brewing Company, of La Crosse, Wisconsin, and was incumbent of this responsible position for a term of two years, and since that time he has never worked on salary, having attained a position of independence and conducted operations on his own responsibility, a fact that is significant, as indicatory of his exceptional business and executive ability, and the more notable by reason of the circumstance that when he came to the United States he had but slight knowledge of the English language. He was for a year engaged in agricultural operations in South Dakota, and at the expiration of that period, in January, 1888, he came to Washington. Here, associated with three others, he purchased the land upon which the town of Sidney, Kitsap county, is now located, and they became the founders of the town, platting the same and placing the lots upon the market. The village is now in a prosperous and thriving condition and its further advancement is assured. It should be noted in this connection that Mr. Bremer has bought and sold land in nearly every section of Kitsap county, being one of the prime factors in its development and his straightforward and honorable course is shown by the fact that he has never been compelled to enter into litigation with any person to whom he thus sold property. Ever since his arrival in Washington Mr. Bremer's principal field of business operations has been in Kitsap county, which is one the western shore of the Sound, and he has been conspicuously identified with the development of its resources, the building up of its towns and the advancing of its material interests. It is a recognized fact that in his real-estate transactions in that county he had done more business than that representing the aggregate of all other operators in this line, and he is well entitled to the distinction of being designated as one of the founders and builders of that section of our great commonwealth, while the statement made affords an idea of the great scope and importance of his work. In 1891 Mr. Bremer platted the town of Bremerton, in the county mentioned, and through his energy, discrimination and far-sighted policy the development of this attractive village was brought about, while the town has as assuredly bright future before it, since he continued to be actively identified with its interests. At that point he sold to the federal government eighty-six acres of land at a sacrifice to himself of fifty dollars an acre, in order to insure the location of the naval station there, thus indicating his public spirit and showing his confidence that the future would justify his course, for a more eligible location for the navy yard on Puget Sound could not be found, and while he lost forty-three hundred dollars on the immediate transaction he firmly believed that his action was politic from a personal as well as general standpoint, and time is proving the wisdom of his attitude. This station has the only dry dock on the Pacific coast that will accommodate the largest type of war vessels, and the significance of this statement can not fail of appreciation even at a cursory glance. Mr. Bremer has not only thus brought about the development of town property, but he has also been extensively engaged in the handling of farming and timber lands in the county, usually buying the property outright and then placing it upon the market, while in numerous instances he has made valuable improvements before selling. He passes Wednesday and Saturday of each week in Bremerton, but maintains his home in the city of Seattle and has his office headquarters in the Bailey building, suite 404. In politics Mr. Bremer gives a stanch support to the Republican party, but he has never had personal ambition in a political way and has taken no active part in public affairs of this nature. His success has been of pronounced type and he is known as one of the representative young business men of the state, in whose future

```
and greater precedence he has the utmost confidence, while a more loyal and
enthusiastic citizen of the commonwealth cannot be found.
     On the 25th of March, 1891, in the city of Seattle, was solemnized the
marriage of Mr. Bremer to Miss Sophia Hensel, who was born in Portage,
Wisconsin, a daughter of William Hensel, a well known business man of Seattle,
and of this union three children have been born, namely:  Matilda, William and
Edward.

BREMERTON CENTENNIAL 1901-2001: William Bremer's Lively Town

Sun | Local

Story by John Wallingford, Sun Staff — Mar 18th, 2001

West Sound hub's origins through 1913

William Bremer died in 1910 at the age of 47. He has been remembered as a benevolent town squire. The city bears his name.

Ambrose Barkely Wyckoff died 12 years later at the age of 74. He is credited by some as saving the Puget Sound Navy Yard. A street -- Wycoff Avenue -- is named for him.

How the western shores of Puget Sound became home to a Navy yard and rollicking young city

In autumn of 1864, a pessimistic Abraham Lincoln labored to keep a war-weary union on course while fighting off a presidential challenge from George McClellan, his onetime top general.

A callow lad named Ambrose Barkley Wyckoff left his family's Illinois farm for the U.S. Naval Academy.

When he arrived at Newport, R.I., he failed his entrance exam, then failed a second try. There was, however, a persistence in his bearing that led academy officers to grant him admission.

At 16, Wyckoff entered the academy as a rangy 6-footer with blue-gray eyes that seemed to smile perpetually. His down-home mannerisms, which inspired fellow midshipmen to dub him "Country," was trumped by an irrepressible will.

He remained an individual among the middie collective, his refusal to study on the Sabbath withstanding the mirthful jibes of his fellow plebes. Longing for the pastoral comforts of home, Wyckoff fought depression by dispatching a veritable library of letters to Jerseyville.

His determination enabled him to overcome ignorance, a severely broken ankle and a bout with pneumonia to graduate with his class.

On June 12, 1868 - William Bremer's fifth birthday - Wyckoff wrote his mother from Sandy Hook, N.Y, where he was aboard USS Savannah on a post-graduation practice cruise. His words foreshadowed a physical vulnerability that would hound him the rest of his days:

"I have been sick ever since leaving the Capes and consequently have had little enjoyment. All the way up I have been ruminating how I can leave the service I am evidently unfitted for in many ways. To stay in the service, I do not think I would live beyond a few years, at least not long enough to gratify my ambition by attaining a very exalted position. Now if I cannot make a mark in history, there is no use making my whole life miserable."

Wyckoff made an abortive step toward a more "congenial" profession, but was dissuaded from entering divinity school by Navy Secretary Gideon Welles. As he predicted, his health proved a continuous source of distress, but he soldiered on nonetheless.

In 1876, with Republican Rutherford B. Hayes and Democrat Samuel Tilden engaged in a tumultuous presidential election, Wyckoff was assigned to the U.S Coast Survey team in California. In 1877, the 29-year-old junior officer joined the survey team in Seattle, and 18 months hence was in charge of charting Puget Sound waters. It was during that work that Lt. Wyckoff was stricken with the bug that defined his career.

He soon earned the sobriquet - derisively used by his opponents in Congress - as "that Puget Sounder."

For he bent the ear of anyone who would listen, including Richard W. Thompson, then secretary of the Navy, on the unsurpassable advantages of Puget Sound vis-a-vis a future Naval base.

The Influence of Sea Power

In 1890, the year pitcher Cy Young earned the first of his 511 victories, Alfred Thayer Mahan published "The Influence of Sea Power upon History." Mahan argued that national prosperity resulted from naval power, and his book quickly became the standard work on the subject, spreading the author's fame across the Atlantic and into the war colleges of Europe.

For an America intent upon flexing its muscles, Mahan's book sounded an alarm to expand a ramshackle Navy. And toward that end, a major installation on the west coast was a practical inevitability.

A decade after Wyckoff started lobbying for a Pacific Coast base, the Navy dispatched a three-man commission, headed by Capt. Mahan, to the Northwest in late 1888. The commission explored the Northwest for five weeks, examining sites on the Pacific Coast, Alaska, the San Juan Islands, the straits of Juan de Fuca, Lake Washington and Puget Sound. The latter was deemed the best prospect, and Point Turner, the future site of PSNS, was selected as the top site in

the Sound.

"It is the citadel of Puget Sound," Mahan wrote, adding that if the east side of the Sound was more advantageous in a business sense, the western shores were "greatly and decisively superior" from every other perspective. Its defensive attributes were unparalleled.

Despite bitter opposition from eastern legislators, Washington Senator John B. Allen, spurred by Wyckoff, won an appropriation of $10,000 to purchase Puget Sound land for a Navy dry dock in 1891.

Bremer's town

William, or "Mr." Bremer, as most people who did business in his town addressed him, was born in the foothills in what was then the tiny Duchy of Brunswick.

He entered banking - his father's profession - before crossed the Atlantic and landing at Ellis Island in 1882.

The tradition says Bremer trekked across the country to join his brother, Charles, at Aberdeen, S.D., where he sold farm implements. Younger brothers Adolph and Otto joined them later, ultimately leaving for St. Paul, Minn.

The view of family patriarch Edward Bremer as a prosperous banker is bolstered by the acumen of his sons. Besides William's real estate triumphs, Otto built a banking empire in the upper Midwest. He created the Otto Bremer Foundation, a philanthropy that lives today. Adolph Bremer married into Jacob Schmidt's brewing empire, rising to vice president.

At 22, William met Sophia Hensel, the 12-year-old daughter of German immigrants. When the Hensels moved to Seattle, Bremer followed. Besides taking a shine to Sophia, William apparently hit it off with Hensel boys Louis, William and Henry, the latter a successful jeweler and the source of the capital that would underwrite the birth of Bremerton.

Bremer and the Hensels, historian Fredi Perry says, sailed the waters of Puget Sound, hiked the unspoiled Kitsap terrain and set up camp in the wild. A favorite spot was the beach the Bremerton Transportation Center now occupies.

By 1889, when it became apparent the Navy was coming, Bremer and Henry Hensel worked to tie up land around West Sound. They got options on land from Sidney to Silverdale to Charleston. When the Navy finally hit upon on a spot, Bremer was ready.

In the Kitsap County Pioneer of Feb. 13, 1890, readers saw the usual boasts of patent medicines such as DuJardin's Life Essence, which promised a "permanent cure for all derangements," right up to and including "Noises in the head and Ears." Readers also found Bremer's advertisement alerting buyers and sellers that he'd be in Sidney on "Saturday of each and every week to look after my business."

The deal goes down

A key figure in the evolution of Bremerton was the mysterious Andrew Williams, who in the 1870s had homesteaded 168 acres of untamed ground now framed by Sixth and High streets and stretching south and west to the shoreline. In February 1891, Henry Hensel made Williams a rich man, buying his whole stake for nearly $200 an acre and paving the way for downtown Bremerton.

Seven months hence, Wyckoff was in town with a mandate to buy 200 acres of land for a dry dock. Some spirited dickering sent him north for flirtation with landowners on Dogfish Bay, but Bremer galvanized a motley collection of owners around Point Turner, convincing them of the wisdom of selling their land for $50 an acre.

Bremer himself owned just 5 acres of the eventual 190 1/4-acre parcel; Hensel owned 81; Charleston pioneer Robert Jertson had 43; Bernth Olsen 21; and 40 belonged to William Sayward and Arthur Scrivener.

The speculative scramble was on as towns were platted and lots peddled. Tracyton, named for Navy Secretary Benjamin F. Tracy, was billed as "the New Navy Yard Town." Town site president Charles H. Kittinger promised the streets were graded and the sawmill was producing 35,000 feet of lumber daily.

Across Dyes Inlet, Benjamin Sparks and Ole Johnson of the Chico company were attempting to cash in on their land "one and a half miles from the land bonded by the Naval Commissioners." They touted pristine freshwater streams, a new post office and two Seattle-bound steamers each day.

The Grace departed Chico at 6:45 a.m. daily and made stops at Silverdale, Tracyton, Sackman, Sidney, Mitchell, Brickyard, Nibbeville, Sylvan Grove, Brooklyn and Colby before arriving in Seattle four hours and 15 minutes later. None of the amenities of Chico, Tracyton or Charleston (which was incorporated as Port Orchard in 1893) could compete with Bremer's embryonic site. He had a hammerlock on the new station, or dry dock, which was the official designation. He said as much in the Sidney Independent in 1892:

"Bremerton lies around the actual dry dock, etc., in such a way as to shut out every competitor. In other words, the farthest lot in Bremerton is nearer to the United States dry dock ... than the nearest lot in any other town or addition."

He advertised residential lots for $50 and business lots for $150, promising reasonable terms. Herbert W. "Josh" Linsley purchased the first plot and became Bremerton's first postmaster in 1892, followed by Civil War hero and downtown businessman John Nibbe in 1898.

Bremer married Sophia Hensel on March 25, 1891. Their first child, Matilda, was born in May 1892. Two boys followed, William John in 1893 and Edward in 1900.

The family summered at Waterman before 1908, when they bought 40 acres at Enetai Beach. They stayed there until 1920, eventually selling the house to Tacoma lumber magnate Ben Cheney.

The Early Years

By the time Wyckoff first saw Puget Sound, Bremerton had seen an intermittent infusion of Euro-American settlers. Charles Wilkes first surveyed the area in 1841, leaving behind names such as Sinclair Inlet, Dyes Inlet and Point Turner. In 1854, Capt. William Renton moved his Alki Point sawmill to the waterfront stretch then known as Port Orchard (today Enetai, on the Manette peninsula). A boiler exploded in 1857, costing Renton sight in one eye. He would sell out and move his business to Port Blakely, and the mill at Enetai eventually burned down.

Warren Smith, namesake of Warren Avenue, and brother Sheldon were prominent early settlers. The original Smith homestead is now occupied by Olympic College, and their land encompassed most of the waterfront between the bridges, including what's now Evergreen Park.

Of course, Native Americans had been present in the area for more than a millennium. The Suquamish tribe had an outpost near what's now the east end of the Manette Bridge, and in 1999, construction workers stumbled on human remains at Evergreen Park. An anthropological firm estimated that native use of the area dates 1,300 years.

Times of trouble

Bremerton and the Navy Yard suffered through the first decade together while Charleston, and even Manette, boomed by comparison. The dry dock, constructed by Byron Barlow & Co., was completed April 23, 1896, and USS Monterey was allowed to dock. The early highlight was the overhaul of the battleship Oregon before its dash around the Cape Horn en route to combat in the Spanish-American War.

Whatever glory was reaped was forgotten in 1899, when Adm. Mordecai Endicott, the Navy's chief of yards and docks, condemned the yard with faint praise, saying that it possessed none of the "desiderata" of a major base and that a better site should be found.

Wyckoff fought back, rallying the Seattle Chamber of Commerce. By 1901, Congress voted to appropriate more than $1.5 million to the Puget Sound Navy Yard.

With the yard suffering neglect and the country in the grip of a depression, Bremerton was anything but booming in the 1890s, when the site of the neighboring installation was commonly referred to as Port Orchard.

By September 1901, with William Turnbull Burwell in charge of the Yard, the streets of Bremerton were littered with lumber and other building materials as businesses sprouted feverishly.

Charleston established a post office in 1901, with Louis A. Bender as postmaster. Bender owned a saw mill on Point Herron in Manette, then known as Decatur, moving it across the Port Washington Narrows to Smith Cove in 1901. When a law was passed prohibiting the dumping of refuse in waters around Bremerton, Bender installed a generator to burn his trash, then sold the resultant electricity, the area's first power plant.

A Lively Town

In official terms, Bremerton became more than a stump-strewn wilderness Dec. 10, 1891, when its namesake founder platted the site. Less than a year later, the Sidney Independent lauded Bremer's peerless ability "to build a lively town."

Apparently, editor W.L. Wheeler knew of what he spoke. Because in another decade, Bremerton's vivacity would become a cause celebre and glower threateningly over the town's future.

Two months before Bremerton incorporated Oct. 1, 1901, a roving columnist from the weekly Seattle Herald & Mail sampled local offerings and returned the verdict that the Navy burg "furnishes all the facilities for a wide-open town."

On Aug. 3, the writer toured the town's nighttime haunts, including a new saloon at Evergreen Park that was illuminated by electricity. Bremerton, in the writer's view, was "full of frolic. People are doing business in shacks, and tents or anything just to get at the trade." Mostly what transfixed the author were Bremerton's colorful array of soon to be notorious saloons.

"They come to rally around its freedom loving stripes in early evening and stay by it till the dawn, when they are carried away to their ships by comrades whose battle-scarred stomachs will not hold enough liquor ... to make their heads dizzy. ... If this naval station ever becomes a success, it will be indebted to the army of intrepid bar tenders," he wrote.

Late in 1902, the 1-year-old city reeled when Charles H. Darling, acting secretary of the Navy, threatened to place the Navy Yard off limits to America's ships until Bremerton refined its morals. The Dec. 30 edition of the Seattle Times said Navy's plans to "adopt heroic measures to protect the enlisted men ... from the evil influences which exist at Bremerton. ... Gambling resorts and disorderly houses ... flourish just outside the yard. ... There are 'big-mitt' games running in Bremerton that hardly would have been allowed in Seattle's wildest days. Saloons are everywhere, bawdy houses of the lowest class thrive in large numbers."

On Jan. 3, 1903, the Bremerton News devoted its front page to a defense of the city and a scathing critique of the Times. Editors Charles and Edgar Gale articulated astonishment that their "quiet, orderly town" had fallen victim to an unjust portrayal from the "fertile brain of the local editor of the paper that would've put to blush the greatest writer of fiction the world has ever known."

Council, mayor battle

For the next six months, Bremerton's five city councilmen banged heads with youthful Mayor Alvyn Littler Croxton in search of a solution that would appease the Navy and, at least three of them hoped, keep the booze flowing out and the cash rolling in along Front Street.

City Ordinance No. 58 passed Feb. 2, 1903, outlawing saloons on Front (now Washington) Street on Nov. 1.

The Navy was first satisfied, then fit to be tied when the "whiskey" faction of the council conspired to repeal the ordinance. That faction included future county commissioner and pioneering auto dealer A.G. Benbennick, Thomas Driscoll, a former Buffalo, N.Y., policeman who rented Front Street property to saloon keepers, and Navy Saloon owner Charles Dietz.

Mayor Croxton pushed through an ordinance causing all liquor licenses to expire April 1, but the whiskey triumvirate got around that by automatically extending permits to April 1, 1904.

The game dragged on into the spring, and by May 2 even the Gale brothers had lost patience, and the News turned its disgust on the city fathers, accusing them of jeopardizing Bremerton's economic future.

The story provided continuous fodder for Seattle newspapers. On May 30, the Seattle Herald & Mail opined that "the sins of the little town of Bremerton have found it out," adding that the town was "drunk with saloons - 16 saloons for 1200 inhabitants."

Finally, on June 6, the whiskey coalition broke. The top story in the Seattle Post-Intelligencer on June 7 told the good news with a large headline trumpeting "BREMERTON IS PURGED OF OFFENDING SALOONS."

A 'model town'

The saloonkeepers saw their licenses expire June 8, 1903. Among the affected entrepreneurs was William Moffett, a native Canadian who ran the Log Cabin

Saloon at Front and Pacific, an area now inside the shipyard gate. Moffett sold the usual array of liquors, wines, beers and cigars, making a specialty of whiskeys such as Jefferson Club and Mt. Vernon Rye.

Also out of luck, at least temporarily, was Dietz, who had opened the United States Dry Dock Hotel in Charleston in 1893. A German immigrant, Dietz had moved on to the bustling town to the east, building the Dietz Hotel and operating his saloon.

But the town's residents had spoken, and the P-I announced that the kingdom was at hand, promising that "Bremerton will be in a class by itself as a model town, from a moral standpoint, adjacent to a navy yard."

The threat had ended, but Bremerton would see its reputation as a hotbed of vice resurrected again and again. There is good indication the good times were rolling again in March 1906, when Jack Smith's Louvre Saloon burned to the ground - while hosting the volunteer fireman's ball.

A.D. Humble, a teenage firefighter who would become the town's first fire chief, shared his memories with The Sun in 1951.

"The saloon burned down," Humble said, "but we did manage to save most of the whiskey."

By 1910, according to the reminiscences of former Mayor Jack McGillivray, Bremerton was again "a real wide-open town." McGillivray, who ran a blacksmith shop on Second Street before being elected mayor, told The Sun that Bremerton circa 1910 "was as tough a place as you could find on the Pacific Coast."

McGillivray, elected mayor twice more in the 1930s after serving two terms as county commissioner, said most of the offenders were refugees from "Soapy Skagway's Gang."

The mayor went to town wielding a sledgehammer.

"The first place we hit was a gambling house run by a fellow named Bulldog Kelly. I knocked on the door and he opened a sliding panel and peaked out at us. When he saw who it was, he told us he was running according to the law. ... I patted the sledgehammer and told him as far as he was concerned, it was the law."

Alas, as with Croxton's attempts, McGillivray's sledgehammer reform lacked the power to stem downtown's good-time tide. The year 1913, local historian B.E. Schureman reported, was a "heyday for crime, graft and immoral enterprises."

Coda

By 1913, the year the Navy Yard's second dry dock was completed, William Bremer was dead, and Ambrose Wyckoff was living a painful existence in Ontario, Calif.

Bremer died at 47 Dec. 28, 1910. He languished in bed three weeks before dying of a mysterious illness.

He has been remembered as a benevolent town squire. He donated property, like that at Fourth and Front in 1893 for Bremerton's first church. He donated two lots for Our Lady Star of the Sea. And in 1892, he built a wharf at the foot of Second Street near his former camping grounds.

Wyckoff, who lived upon the rotten old sealer Yukon as first commandant of the Navy Yard, realized his dream Sept. 16, 1891.

His 43-year-old joints aching with the rheumatism, he watched his daughter, Selah, hoist the American flag up a denuded fir tree on the grounds of the future dry dock.

Wyckoff's infirmities soon made a career in the Navy untenable, and James C. Morong relieved him as commandant Jan. 10, 1893.

"So while I eventually saw my cherished project of a naval station on Puget Sound started, it proved the means of my own undoing and prevented my reaching the high rank which is every naval officer's ambition," Wyckoff wrote in a 1901 article in Washington Historian.

After being retired in July 1893, Wyckoff visited home and made his way to Chicago for the Columbian Exposition. A.L. Croxton, who would come to Bremerton in 1899 as the Navy Yard's chief electrician, headed Standard Electric Co.'s exhibit.

After finishing nearly a decade as head of the Navy's Branch Hydrographic office in Port Townsend, Wyckoff returned to Puget Sound from time to time to rally support for the Navy Yard. He eventually toured the site with U.S. House Speaker Joe Cannon, who paved the way for the building of the second dry dock. Some say Wyckoff, who wrote the amendment that gave rise to the Lake Washington Canal, actually saved the yard.

As he foresaw at the age of 20, he paid a dear price for his dream. A year after Bremer's death, on Dec. 30, 1911, Wyckoff wrote to his old pal Terrell:

"My health is such that the use of a pen is a painful effort. I feel very grateful to the people of Charleston for having named one of the principal streets after me ..." Alas, the street a block west of Callow that bears his name is spelled incorrectly as, "Wycoff."

His life stretched on much longer than he had anticipated. He remarried in 1902 and fathered two more children.

With America's involvement in World War I growing probable in the spring of 1915, Wyckoff angled for a role. He petitioned the Navy again and again, to no avail.

He died on Memorial Day in 1922, and the Ontario Daily Report offered this chronicle of the death of "That Puget Sounder":

"Just after the G.A.R. and the Legion Memorial Day parade had passed his home, and he heard the muffled drums' last beat, he said, 'There they go now' " ...

- Information for this story was compiled from records at the Kitsap County Historical Society. In addition, local historians Fredi Perry and Russell Warren graciously shared their knowledge.

The Bremers:

It was their kind of town

By Ron Judd
Sun Staff Writer

It is a warm July day in downtown Seattle, and Ed Bremer is dying.

Lying on a hospital bed in the living room of his Bremerton home, he is not talking — perhaps by personal choice, perhaps by an ear at all.

Bremer and the nurse know the old man has little time left, however, and it is to them to come from a time that no longer exists.

The siblings need to be checked. Here to go across town. I have to call Mother. She'll be worried.

In the final days, Bremer's mind has died a decaying body, returning to its sweetest memory: Bremerton in its heyday.

In Bremerton's finest hour, Sophia Bremer and her children are riding the crest of a wave of prosperity that began to roll in 1891 and would not crash for nearly eight decades.

It is Friday morning — any Friday morning between 1940 and the cold-1980s — and Bremerton resident Joy Stokes remembers the days of her youth.

Friday mornings are special at the Bremer Estate office where Mrs. Stokes, then a prominent works as a personal secretary to a strapping young Ed Bremer, the local scion of one of the area's few Seattle-based families that owned a city.

Bremer, dark-haired and haphazardly handsome, has inherited not only the family wealth (or a man of his, for that matter) climbs the stairs in the downtown Eagles Building and shuffles into the Bremers' office.

His clothes are dirty. Bremer is a hands-on man. In his daily rounds of his family's city, he has joined some of his many employees Pond to keep Bremerton, the city, a glowing monument to Bremer, the family.

Ed would not hesitate to demonstrate his way — the only way.

In his hands are dirty but it is for a good cause: Ed has been preparing for The Friday meeting. Inside, Ed and Joy Stokes Bremer shuffles past his secretary into a private office.

The Bremer employee swings the downstairs door open, revealing a long, dark nuts. A uniformed black chauffeur named Eugene jumps from the driver's seat, rushes around the car and hastily but politely opens the door.

From the car emerges an impeccably dressed, middle-aged man with striking features but a soft, almost effeminate manner: John Bremer, the elder son who had been left in charge of the family interests other underneath most legal and financial aspects of the business from a desk at the family home, sprawled upon Seattle's Capitol Hill.

It does so under the careful watch of the need to leave the car: Bremerton's first lady, Sophia Bremer.

Also elegantly dressed, Mrs. Bremer oozes dignity and poise as she enters the office and her late husband's employees.

Still, the smiles pleasantly and greets the

Boom town: cars line the First Street Dock in 1924, awaiting the ferry to Seattle.

William Bremer

Bremer's office staff. The woman who more than anyone else would shape the future of the city and the Bremer family has not let her high standing get to the way of niceties. She maintains a mixed-bag face of pleasantry and power when dealing with her employees and even the general public.

a very fine woman." recalls Mrs. Stokes. But old-world people were a way. I always felt very happy with her. She never made you feel in awe of her."

Of course, she was forthright. She would say what she wanted to say, but she was very, very fair.

Pleasantries exchanged, the Bremer class disappears into a private office reserved for the Friday meetings. Inside, Ed, John and Sophia discuss this week's events and next week's agenda.

They will decide the latest step on a long journey toward maintaining their sense of worth — all that William Bremer had left them.

WHAT WILLIAM BREMER left behind had been obtained through a stroke of what then was considered financial genius.

Trained in banking and finance, the German-born Bremer had arrived in Seattle in cash in an largely unclaimed Puget Sound shorelands. Hearing the U.S. government was about to open up huge tracts of land in Washington or Oregon, Bremer and a partner (Henry Hensel, brother of Sophia Hensel Bremer) invested $25,000 to buy what now is much of West Bremerton and a small part of the Manette peninsula.

Acting as a representative of other local property holders, he turned around and sold a large parcel to the government in 1891, absorbing a $18,000 loss on his own land.

It was a loss he could take. The large financial risks the Bremer family never would take.

It paid off handsomely. With his remaining land, Bremer began to build a town on his shipyard, and the two grew together.

Bremer's little city became Bremer's big city almost too easily. The shipyard created an automatic, long-lasting source of people and revenue. Later, during the boom years of World War II, the shipyard workforce would balloon to 32,500, and the city population to 80,000.

Under those conditions, Bremerton was destined to prosper — with or without its founder's uncanny business sense.

His family proved it after Bremer's unexpected death in 1910.

William Bremer's passing remains largely unexplained. The story is that he had taken ill, and that his wife administered a prescription from a pharmacist.

It is said the prescription was mislabeled, and that the medicine poisoned the 47-year-old land baron. William's younger son, Ed, was only 10 years old at the time, but he would remember it until his own death.

Ed, in his final years of reminiscence, would tell his nurses that Sophia Bremer had had the killer medicine bottle analyzed, finding that it contained a poison, such as cyanide. Mrs. Bremer had considered suing the pharmacist, Ed recalled. But she decided not to.

Ed, if he knew, never said why.

ALTHOUGH WILLIAM BREMER did not live to see the full fruition of his dreams, his presence and values in his young son, Ed's life forever would be shaped by the elder Bremer's qualities.

The essence of the city father was described in his obituary, which was read by hundreds of friends and associates. His eulogy painted him as a powerful yet generous man who had given many a penniless, would-be businessman a marvelous opportunity to succeed.

In the interest of establishing his city, Bremer had been lenient with rent and lease terms, sometimes even letting them slip altogether. He donated property and money to charity and churches.

And he did it all quietly.

Bremerton businessmen kept their doors open during the Great Depression, granting eulogy hints at the rest of their devotion: "He was generous almost to a fault, and to his own loss and detriment."

In his youth, Ed Bremer could not have known what those words would mean for his future.

In the end, they would explain why Ed's way was the only way; why Bremerton, the city, became a monument to Bremer, the family.

All of those notions sprang from Sophia Bremer's powerful and immediate reaction to her husband's death.

Almost from the moment Sophia, by all accounts, seized control of the family business while drawing her children close to her in an incredibly bad emotional rut that would encircle them for the rest of their lives.

Acquaintances say Mrs. Bremer's reaction was natural. Women of her day, with her upbringing, rallied their families together in times of crisis.

"[Sophia] had a lot on her plate to look after when her husband died."

John, who later was to control the family's business, was 17 years old. Sophia, 47, alone at the helm.

She had full authority to control the business. William Bremer's will, unvaried by hand in 1905, left one dollar to each child, and the rest of the estate — valued at over a million real estate then appraised at $91,000 and personal property worth $10,000 — to Sophia.

But he left more than waterfront properties.

When Bremer the man passed away, Bremer the image was born and quickly adopted by the family.

The image, simply, was Bremer as he had been in life: a strong, fair, and kind business pioneer driven by a curious blend of benevolence and omnipotence. The family was brave sorry to its recipients, the latter to all. Together, they formed the bedrock of the Bremer legend.

Sophia cut and rounded her children to fit it. She would make sure the family lived up to the image.

And the children fell obediently in line. Not only did they follow, they marched in perfect step.

Neither John, Ed, nor their older sister Mathilde ever seemed to question the mission: certainly none abandoned it.

For Ed, happiness and contentment became equated with maintenance of the image.

"It was his occupation," said Mrs. Stokes.

Bremer's little city became Bremer's big city almost too easily. The shipyard created an automatic. long-lasting source of people and revenue. Later, during the boom years of World War II, the shipyard workforce would balloon to 32,500, and the city population to 80,000.

Under those conditions, Bremerton was destined to prosper - with or without its founder's uncanny business sense.

His family proved it after Bremer's unexpected death In 1910.

William Bremer' passing remains largely unexplained. The story Is that be bad taken ill, and that his wife administered a prescription from pharmacist.

It Is said the prescription was mislabeled, and that the medicine poisoned the 47-year-old land baron. William's younger son, Ed, was only 10 years old at the time, but he would remember It until his own death.

Ed, In his final years of reminiscence, would tell bis nurses that Sophia Bremer had had the killer medicine bottle analyzed, finding that t contained a poison, such as cyanide. Mrs. Bremer had considered suing the pharmacist, Ed recalled. But sh decided not to.

Ed, If he knew, never said why

In the early 1900s (1900 - 1905, maybe later), Bremer was doing business out of The Bailey Building in Seattle

History

"In the Navy Yard of Puget Sound", in *Seattle and the Orient* (1900). Two ships are shown in drydock; the two circular insets are titled "Iowa coming up the Sound" (upper) and "Torpedoboat Rowan" (lower).

1890s

Bremerton is within the historical territory of the Suquamish people. The land was made available for non-Native settlement by the Treaty of Point Elliott of 1855. Bremerton was planned by German immigrant and Seattle entrepreneur William Bremer in 1891. In that year, Navy Lieutenant Ambrose Barkley Wyckoff purchased approximately 190 acres (77 ha) of waterfront land on Sinclair Inlet. This land was owned by the Bremer family. Three years earlier, a U.S. Navy commission determined that Point Turner, between the protected waters of the Sinclair and Dyes inlets, would be the best site in the Pacific Northwest on which to establish a shipyard. Recognizing the large number of workers such a facility would employ, Bremer and his business partner and brother-in-law, Henry Hensel, purchased the undeveloped land near Point Turner at the inflated price of $200 per acre. In April 1891, Bremer arranged for the sale of 190 acres (0.77 km^2) to the Navy at $50 per acre. This land became part of the initial footprint of the Puget Sound Navy Yard.

1900–1930

Bremerton was incorporated on October 15, 1901, with Alvyn Croxton serving as the city's first mayor. Progress in the new city soon faced a major crisis, as Assistant Secretary of the Navy Charles Darling moved all repair work to the Mare Island Navy Yard in California in November 1902. Darling cited reports from commanders that the Bremerton waterfront was rife with prostitution, opium houses and frequent strongarmed robberies of sailors. Politics were probably also at play, as local newspapers reported that the city's incorporation left the shipyard essentially landlocked without room to expand. A dispute ensued between Mayor Croxton, who wanted to shutter all saloons in Bremerton, and three members of the city council, who attempted to block his efforts. Croxton eventually won out, and the council voted to revoke all liquor licenses in June 1904. With the ban, Darling reestablished the navy yard as a port of call. Saloons had begun to return to business within two years, however.

In 1908, the city library and Union High School were established to serve the educational needs of the 2,993 residents recorded in the 1910 U.S. Census. During World War I, submarine construction and the addition of a third drydock caused the shipyard's workforce to balloon to over 4,000 employees. Growth due to the war effort and the 1918 annexation of the city of Manette, east of Bremerton on the Port Washington Narrows, can be seen in the 1920 census, which reported a population of 8,918. Bremerton absorbed Charleston, its neighboring city to the south in 1927. The population reached 10,170 in 1930.

1930s

Manette was linked to Bremerton by the Manette Bridge, a 1,573-foot (479 m) bridge constructed in June 1930. Prior to this time, the trip could only be made by ferry or a long trip around Dyes Inlet through Chico, Silverdale, and Tracyton on mostly unimproved roads. This wooden bridge was replaced with a concrete and steel structure in October 1949. It was replaced by the new Manette Bridge in 2011. At the shipyard, the 250-foot tall (76 m) Hammerhead Crane No. 28 was completed in April 1933. One of the nation's largest, it is capable of lifting 250 tons and continues to dominate the Bremerton skyline.

1940s

Bremerton's Admiral Theater opened in 1942 as a cinema; in the 1990s it was remodeled for performances and banquets.

At the peak of World War II, the Bremerton area was home to an estimated 80,000 residents due to the heavy workload of shipbuilding, repair and maintenance required for the Pacific war effort. Most of the relocation was temporary, though, and only 27,678 citizens were left in the city by 1950. During the 1940s, presidents Franklin D. Roosevelt and Harry S. Truman both visited Bremerton. Roosevelt made a campaign stop at the Puget Sound Naval Shipyard on August 12, 1944, giving a national radio address in front of a backdrop of civilian workers. During the course of his 35-minute speech, it is

Shipyard on August 12, 1944, giving a national radio address in front of a backdrop of civilian workers. During the course of his 35-minute speech, it is believed the president suffered an angina attack, experiencing severe chest and shoulder pain. An electrocardiogram was immediately administered once he left the podium, but it showed nothing abnormal. President Truman took a two-day tour of Washington state in 1948, speaking from the balcony of the Elks Club on the morning of June 10. Local legend has it that a man in the large Pacific Avenue crowd yelled the infamous "Give 'em hell, Harry!" line for the first time. This is a matter of dispute, however, as local newspapers quoted the man as having shouted "Lay it on, Harry!" Despite this, there is a bronze plaque attached to the corner of the building declaring that spot to be the place where the phrase "Give 'em hell, Harry" was first uttered.

With the return of World War II GIs to the homefront, the need for post-secondary education became evident to officials of the Bremerton School District. Olympic Junior College (now Olympic College), a two-year institution, opened its doors to 575 students in the fall of 1946. Initially, it operated in the former Lincoln School building, gradually moving operations to World War II–surplus Quonset buildings at its current 16th & Chester site. About 100 students received associate degrees at the first commencement exercises held June 10, 1948. President Truman was in attendance and received the college's first honorary degree. Operation of the college transferred from the school district to the state of Washington in 1967.

1950–1970

The 1950s and 1960s were a period of stability for the city. A second high school opened in 1956,[12] and two comprehensive high schools operated in the city until 1978. Growth in East Bremerton necessitated the construction of another span across the Port Washington Narrows in 1958. The $5.3 million, four-lane Warren Avenue Bridge allowed for increased traffic on State Highway 21-B (now State Route 303).

The battleship USS *Missouri*, site of the Japanese surrender treaty signing that ended World War II, was assigned to the Pacific Reserve Fleet at PSNS in 1955. For 30 years, she served as the city's primary tourist attraction. Hundreds of thousands of visitors walked the "surrender deck" before the ship was recommissioned in 1985. She was decommissioned on March 31, 1992 (final), and her name was struck off the register on January 12, 1995. In 1998 "Mighty Mo" was donated to the USS *Missouri* Memorial Association and became a museum ship at Pearl Harbor, Hawaii.

Population growth was flat, with 26,681 enumerated in the 1960 census, leading Bremerton leaders to annex the shipyard the following year in an effort to include stationed sailors in those figures. While the Vietnam War spawned protests and sit-ins on the Olympic College campus, the city was relatively free of civil disorder during the 1960s.

1970s

With the 1973 selection of the Bangor Ammunition Depot 12 miles (19 km) northwest of Bremerton as the Pacific home of the new Trident submarine fleet, residential and commercial development began to move north, closer to Silverdale, and farther from the Bremerton downtown core. Numerous failed proposals were made at redevelopment beginning in the early 1970s, including discussions of a waterfront hotel and the erection of a large canopy over the central business district. Meanwhile, most of the city's office and retail space remained in the hands of Edward Bremer, son of William Bremer and the sole remaining heir to his wealth. (In order to receive their inheritance, William Bremer's three children were honor-bound to never marry.) Bremer began to neglect his properties, never increasing decades-old lease rates and failing to make necessary maintenance upgrades. In 1978, the Bremerton City Council passed an ordinance declaring the entire downtown a "blighted area".

1980s

In 1985, Safeco subsidiary Winmar Corporation developed the Kitsap Mall in Silverdale. With lower taxes and minimal planning regulations in the unincorporated town, Silverdale achieved virtually unfettered growth. Sears, J.C. Penney, Montgomery Ward, Nordstrom Place Two, Woolworth and Rite Aid all closed their downtown Bremerton stores in the 1980s and '90s. Upon the death of Edward Bremer in 1987, the Bremer properties were placed under the complete control of a trust held by Olympic College. Not being in the real-estate business, the college did not actively market its holdings, and the downtown was composed almost entirely of very large empty storefronts. As of January 2010, many buildings remained vacant.

1990–present

The Norm Dicks Government Center

In recent years Bremerton has seen its share of community setbacks. Like many other West Coast cities, Bremerton school teachers were pitted against their district's administration for nearly a month in September 1994 during a contentious strike. Four elderly residents were killed in an enormous three-alarm fire that destroyed the 165-unit Kona Village apartment complex in November 1997. Damages were estimated at $7.5 million. A replacement senior apartment building has since been built.

Despite a hard-fought battle throughout the mid-1990s by local politicians to have the decommissioned and mothballed USS *Missouri*, already in the Bremerton Navy Yard, stay in Bremerton as a museum ship and tourist attraction, Secretary of the Navy John H. Dalton awarded the ship to the Pearl Harbor Naval Base, Hawaii, in 1998. It now sits near the USS *Arizona* Memorial to demonstrate where U.S. involvement in World War II started on December 7, 1941, and where it ended by the signing of the instrument of surrender by the Japanese on board the USS *Missouri*, on September 2, 1945.

Beginning with the building of a waterfront boardwalk and marina in 1992, Bremerton had begun the process of revitalizing its downtown community. That same year, the Bremerton Historic Ships Association opened the destroyer USS *Turner Joy* (DD-951) to public tours at the end of the boardwalk; the ship was built in the Puget Sound area in 1958, commissioned in 1959, and had played a back-up role in the 1964 Gulf of Tonkin incident that further escalated U.S. involvement in the Vietnam War with the Congressional passage of the Gulf of Tonkin Resolution, allowing President Lyndon B. Johnson to send fighting troops in addition to the "advisors" already on the ground in Vietnam.

In 2000, Bremerton saw the opening of the waterfront multimodal bus/ferry terminal and a hotel/conference center complex in 2004. The high-rise Norm Dicks Government Center also opened that year, housing City Hall and other government offices. The Waterfront Fountain Park and Naval History Museum adjacent to the Bremerton Bus/Ferry Terminal opened in 2007, and a newly expanded marina with more boat capacity was completed in 2008. Plans to build an extension to the current boardwalk from the USS *Turner Joy* to Evergreen Park is in the litigation stage. Even though the boardwalk extension project is fully funded, opposition to the extension by the Suquamish Tribe concerning the impact to treaty fishing rights threatens the project. Fairfield Inn and Suites by Marriott, a 132-room hotel, opened in March 2010 on the site of the old City Hall building made obsolete by the new Norm Dicks Government Building.

Condominiums were built on the waterfront to lure more people to live and shop in the downtown area as part of the revitalization effort. However, construction delays and economic downturn forced the builder of the publicly funded Harborside Condominium complex, the Kitsap County Consolidated Housing Authority, to fall $40.5 million in debt. That debt later was taken on by Kitsap County, which hired a marketing firm to sell the remaining units at a lower-than-anticipated price.[13] The privately built 400-condominium complex north of the Harborside complex opened shortly before the Harborside

complex and also didn't sell as well as projected. The remaining empty condos were eventually sold at auction for a lower cost.

The 2.5-acre (1.0 ha) Harborside Fountain Park opened on May 5, 2007. Located on the waterfront just steps away from the Kitsap Conference Center, the park features five large copper-ringed fountains, wading pools, and lush landscaping. The park will also be home to the Harborside Heritage Naval Museum. [14]

A tunnel underneath downtown, traversing from the ferry terminal to Highway 304 (Burwell Street), has been newly opened that allows for a smoother egress for vehicles exiting the car ferry and makes for a more pedestrian friendly downtown. A new fountain park above the tunnel blends water and art, along with the bow of a ship and the conning tower of a submarine as a tribute to the workers at the Bremerton Naval Shipyard over the years. The stations along the walk include pictures of the shipyard, workers, and shipbuilding and repair statistics.

The popular Blackberry Festival is held annually during Labor Day weekend on the waterfront boardwalk to celebrate everything blackberry. Local residents, shopkeepers and growers bring their blackberry ice creams, pastries, pies, jams, jellies, candies, and even ciders and wines to this annual event. Free entertainment includes music by local musicians and entertainers performing throughout the three-day festival, the Berry Fun Run, and the Blackberry Criterium Bike Race. Bremerton National Airport sponsors the annual Blackberry Festival Fly-In, with shuttle service provided by Kitsap Transit to the festival. As the festival's background story goes, the downtown waterfront of Bremerton where the festival takes place was a massive overgrowth of wild blackberry bushes that were removed to build the waterfront Fountain Park, Boardwalk, Marina and Bus/Ferry Terminal.

HistoryLink.org article on Bremerton

HistoryLink.org article: Source : [HW0033][GDrive]

The city of Bremerton, home to the Puget Sound Naval Shipyard & Intermediate Maintenance Facility, was founded in 1891 by German immigrant William Bremer. The main part of the city is on the Kitsap Peninsula's Point Turner, approximately 15 miles west of Seattle. The history of Bremerton and that of the navy base have always been inextricably entwined, with the fortunes of the former highly dependent on the activities of the latter. Bremerton made it through the ups and downs of a military-dominated economy for most of the twentieth century, but barely survived the 1980s when almost every major business enterprise moved to Silverdale, and significant military spending was diverted to the new Trident submarine base at Bangor. The city managed to hold on through the 1980s and 1990s, and in more recent years took steps to reinvent itself and revitalize its economy.

The Suquamish

The Suquamish, or "people of the clear salt water" in the Lushootseed tongue of the Coast Salish linguistic group, established permanent winter camps on the islands and peninsulas of the central Puget Sound as long ago as 5,000 years. During the summer months they would decamp from their permanent settlements and travel by canoe to seasonal grounds to fish the rivers, hunt, and gather berries and other edible plants. Their primary settlement was Old Man House at present-day Suquamish, about 12 miles north and a little east of Bremerton.

The Suquamish had two great nineteenth-century leaders whose names live on today. The first was Kitsap (1780?-1860), a war chief who won renown in 1825 by leading an attack against the warlike Cowichan Tribe of Vancouver Island. Kitsap County and the Kitsap Peninsula honor his memory.

The other was Seattle (178?-1866), a nephew of Kitsap who was chief of both the Suquamish and Duwamish tribes when the full Denny Party arrived at Alki Point in 1853. Chief Seattle also had proved himself in battle against Native enemies, but was considered a true friend of the white settlers. At the urging of early settler David "Doc" Maynard (1808-1873), the hardscrabble little village of Duwamps on Elliott Bay was renamed after Chief Seattle in 1853.

Today there are approximately 950 registered members of the Suquamish Tribe, and about half of them live on the Port Madison Reservation. Although they still exercise their treaty rights to fish and gather shellfish at their traditional grounds, the tribe also operates the luxurious Suquamish Clearwater Casino Resort on the Kitsap Peninsula near Agate Passage.

Exploration and Exploitation

The first official American survey of the waters around present-day Bremerton was conducted in 1841 by Lieutenant Charles Wilkes (1798-1877) of the United States Exploring Expedition. It was Wilkes who named Point Turner, the peninsula where much of Bremerton and the Puget Sound Naval Shipyard are now situated, and he was struck by the suitability of the area for naval use:

"There is not in the world nor could there be a harbour superior to Port Orchard — Good anchorage, protected from every point with many little basins about the size of a Dry Dock but hard sandy bottom, into which a ship of the line may be hauled & left dry at low water. A pair of floodgates & a foundation would make a dry dock without any other expense or trouble" (Charles Wilkes and the Exploration of Inland Washington Waters, 176).

In the years following Wilkes's survey, white settlers started appearing in Puget Sound in increasing numbers. Among the first to homestead near present-day Bremerton were William Littlewood and Daniel J. Sackman, the latter of whom fathered four children by a Suquamish woman. Another early arrival was Captain William Renton (1818-1891), who built a sawmill on Alki Point in 1853 but relocated it to the Manette Peninsula the following year. His was the first industry of note in the area and the first sawmill, but many more were to follow, drawn by the seemingly endless expanse of virgin timber.

A Northern Navy Base

In 1877, Ambrose Barkley Wyckoff (1848-1922), a sickly young lieutenant with the U.S. Coast and Geodetic Survey, piloted the schooner Yukon on a hydrographic mapping voyage in upper Puget Sound and Commencement Bay. Wyckoff, like Wilkes, recognized the region's military potential. Upon returning to the East Coast in May 1880 he started what would become a long campaign to establish a naval base in the sheltered but roomy inland waters of Sinclair Inlet at the southern end of Port Orchard Bay.

Studies by two presidential commissions, one of which included Ambrose Wyckoff, concluded that the southern shore of Point Turner had everything necessary for a naval base: sheltered but deep water close to shore; abundant supplies of timber; unlimited fresh water from the region's many rivers; and huge fields of bituminous coal within just few miles of Seattle, itself easily accessible by water. The merits of the place overwhelmed all objections by advocates for other sites, and Congress, albeit with some reluctance and a pinched purse, finally allocated $10,000 for the purchase of land and an additional $200,000 to begin construction of a dry dock.

A Quick Buck or a Longer View

Within just a year or two of Wyckoff's 1877 visit, rumors were circulating that there would be major federal land purchases made in the area for a naval base. Homesteading loggers who had struggled for years to eke out a living now hoped that their property was worth many times what it would have brought just months earlier. The rumors came true, but the hope of a windfall generally did not. Ambrose Wyckoff was sent to buy the land, but with strict instructions to pay no more than $50 an acre.

The chasm between what the settlers thought their property was worth and what the government was willing to pay created opportunities for men who had a longer view of things. William Bremer (1863-1910) and Henry Paul Hensel (1871-1935), both of Seattle, reasoned that once the navy base was established -- indeed, even while it was being established -- it would need a town to support it, and that was where the real money would be made.

Bremer had the plan and Hensel, a Seattle jeweler and Bremer's soon-to-be brother-in-law, had the money. In February 1891, one month before Wyckoff arrived on his land-buying mission, the two purchased the original homestead claim of settler Andrew Williams, agreeing to pay close to $200 an acre for nearly 170 acres of land that Williams had sold to his son for $3 an acre not too many years earlier. The property was logged-off waterfront bordering Sinclair Inlet, right at the heart of the proposed navy base.

When Wyckoff came calling, Bremer and Hensel sold him 81 acres of the Williams property for $50 an acre, losing, on paper, over $12,000, but keeping property inland from the planned facility and on the point of the peninsula where Sinclair Inlet met Port Washington Narrows. On September 16, 1891, Wyckoff was appointed the first commandant of what was then called the Puget Sound Naval Station, and by June 1892 he had completed the purchase of a little more than 190 acres at the prescribed price of $50 per acre.

William Bremer's Town

While Wyckoff was busying himself buying up land for the naval base, Bremer, having obtained Hensel's interests, set about building a town next door. **In September 1891 the navy raised the American flag over its land, and three months later, on December 10, Bremer filed a 25-acre plat for a new town named, somewhat immodestly, "Bremerton."** The navy base and the town thus came into the world together, and their fortunes have been linked, in good times and bad, ever since.

One year later, in December 1892, work began on the station's first dry dock, a 650-foot-long "graving" dock capable of handling the navy's largest ships. While that was going on Bremer nurtured his new town by donating or selling at discount prices land for schools and churches. He also built Bremerton's first wharf at his own expense and helped numerous businesses get off the ground. But the financial Panic of 1893 slowed progress on the naval base, and this in turn slowed Bremerton's development. Dry Dock No. 1 was finally completed in 1896, but things only got worse. Federal funding dried up, and both the base and the town staggered through the remaining years of the nineteenth century.

Wyckoff to the Rescue

Health problems forced Ambrose Wyckoff's early retirement in July 1893, but he **returned to the area in 1899 as a civilian, disturbed by reports of plans to close and relocate the naval base. Wyckoff enlisted the help of the Seattle business community, and the city's Chamber of Commerce prepared and submitted to Congress a persuasive report stressing the yard's importance to the regional economy.** This had the desired effect; federal funding was greatly increased in 1900 and 1901, and the workforce at the base quickly grew from fewer than 150 to more than 600.

As the base prospered, so did Bremerton. Soon the town was sprouting businesses of all kinds. A weekly newspaper, The Bremerton News, started publication on June 8, 1901, and its first issue claimed that 24 new businesses and 70 homes had been built in the previous three months. The workforce at the navy yard supported a half-dozen general stores, at least 15 saloons, and a post office. There were rooming houses, a barber shop, a hotel, a laundry, two cigar stores, even a "shooting gallery." Culture was served as well, with the nearby Charleston Social Club featuring a performance by the "Bremerton Orchestra" (The Bremerton News, June 8, 1901).

Just a month later, in July 1901, a group of the town's citizens petitioned the Kitsap County Commissioners for incorporation. The lengthy list of voting-age residents who signed the petition did not include William Bremer, who continued to reside in Seattle. On October 2, 1901, the voters approved the incorporation of Bremerton as a city of the fourth class. The town's first mayor was Alvyn Croxton (1869-1941). An election in January 1902 returned Croxton as mayor and seated A. P. Stires, Thomas Driscoll (1845-1934), J. J. Kost, F. W. Coder, and C. Hanson as the town's first full five-member council.

In July 1902 a private company brought in Bremerton's first piped water through wooden mains. In August the first official volunteer fire department was formed, and the following December phone lines came in. William Bremer's plans seemed to be proceeding smoothly, but some serious trouble was brewing on the town's rowdy Front Street.

An Often Uneasy Affair

It was inevitable that Bremerton would attract businesses that catered to the less-savory inclinations of young sailors and transient workers. Prostitution, gambling, drunkenness, opium, muggings -- the panoply of human temptation and weakness -- were present from the beginning. By late 1902 Bremerton had a population of about 1,700, and there were 16 saloons, all within a short walk of the navy's front gate. It was a wide-open town, and less than a year after Mayor Croxton was elected the navy threatened to shut it down, warning that it would boycott its own shipyard in order to save its sailors from Bremerton's "gross immorality." An Olympia newspaper, under the headline "Too Bad for Them," reported:

> "An official report received today from Rear Admiral Yates Stirling ... details a deplorable state of affairs in Bremerton, and Acting Secretary of the Navy

Darling today issued an order that will have the effect of keeping naval vessels away from that station in future until the nuisance is abated.

Gambling resorts and disorderly houses, the report says, flourish just outside the yard, especially when one of the war vessels is in port ..." (Morning Olympian, December 31, 1902).

Mayor Croxton was quick to respond, issuing a statement on January 1, 1903, that said, in part:

"The report regarding Bremerton is an unqualified falsehood ... . There are no card sharks, bunco men, or bawdy houses in the town" (Morning Olympian, January 1, 1903).

With no apparent sense of irony, Croxton two days later announced that he would close all public gambling in Bremerton. This decision was not met with universal approval, even among members of the city council, nor was the navy overly impressed. It continued to issue threats and broadsides, and expanded the circle of blame to Seattle, describing it as

"a harbor for all of the bad elements of lumber camps, mining camps and seaport towns, and ... a degree of immorality exists there that is equal to that of any city in the United States, and much of this element works in Bremerton ... " (Morning Olympian, January 8, 1903).

The battle over vice pitted the U.S. Navy against Bremerton's gambling houses and saloons, with the mayor and council in the middle and fighting among themselves. Resolution seemed possible on February 2, 1903, when the council, at the persistent urging of Mayor Croxton, doubled the licensing fee for saloons and rescinded the licenses of the five or six drinking and gambling houses located nearest the base on Front Street (which was south of today's 1st Street). But a pro-saloon faction on the council managed to rescind the Front Street ban within weeks, and a short game of tit-for-tat was on.

Mayor Croxton next pushed through an ordinance that would cause all liquor licenses to expire on April 1, 1903; the council responded by automatically extending all licenses for an additional year. The navy chimed in, again threatening to pull out "unless every saloon is moved from Front Street" (The New York Times, May 25, 1903). This time the threat worked -- the pro-saloon coalition collapsed, and the council went the navy one better by revoking every liquor license in town, effective June 8, 1903. The ban of course did little to stop either drinking or gambling, but it did make it a little less obvious and a little more distant.

This Town for Sale

The navy's overbearing attitude and charges of rampant immorality really bothered William Bremer, who had put his money and his good name into the town, and by early fall of 1903 he'd had enough. His reasoning was simple: If the U.S. government wanted to dictate how Bremerton should be run, then the U.S. government should buy the damn town and run it. By September 4, 1903, Bremer had obtained powers of attorney from nearly all of Bremerton's commercial land owners and disclosed that his asking price was $350,000. Later that month he traveled to Washington, D.C., and offered Bremerton lock, stock, and barrel to the navy at the discounted price of $300,000. But the navy thought the price was still exorbitant; Bremer came home disappointed, and never tried again. Nor did his widow, or his children. Even today, a significant part of downtown Bremerton is owned by a trust established by William Bremer's sons, John and Edward.

The ban on saloons and legal liquor sales stayed in place for about two years without significantly reducing Bremerton's overall sin quotient. But the navy was pacified, and quietly allowed a handful of liquor licenses to be issued. The entire state went "dry" in 1916, and nationwide Prohibition started in 1919. Sailors still got drunk in and around Bremerton, and gambling and prostitution did not disappear, but the city's leaders were no longer accused of being complicit.

Despite its somewhat raucous reputation, or perhaps because of it, Bremerton continued to attract new residents and businesses. The February 1909 issue of Coast magazine described the town:

"Bremerton has a population of about 3,000 souls, and is daily adding to its numbers. The business interests are large and increasing. On every hand is seen the widest activities in all lines of business. A large saw mill, ice and cold storage, lumber yards are located here and groceries, dry goods stores, boot and shoe stores, bakeries, restaurants, hotels, saloons and all kinds of business departments are numerous and thriving.

New, substantial brick and concrete business blocks, public halls, several hotels, one of which is a large three-story structure, and countless numbers of residences of a lasting and permanent nature are now under construction or just being completed" (Coast, p. 112).

The Second Decade and World War I

William Bremer died young, at age 47. On the day of his burial, December 30, 1910, Bremerton's businesses closed for two hours in the afternoon and the town's flags were flown at half-mast. **His widow, Sophia Hensel Bremer (1872-1959), took over management of the family properties and with the three Bremer children she would continue to play an influential role in Bremerton for many years. One of the family's signature projects was the construction in 1914 of the Bremerton Trust and Savings Bank building on the northeast corner of 2nd Street and Pacific Avenue, one of three buildings in Bremerton designed by noted Seattle architect Harlan Thomas (1870-1953).**

Employment at the yard reached 1,620 by the early summer of 1909, but the roller-coaster nature of an economy based on military needs became clear two months later when work slowed. The labor force was reduced by more than half almost overnight, only to grow to 1,500 again within a year, a pattern of ebb and flow that would be repeated with varying intensity for decades. And, of course, the population of Bremerton saw huge temporary spikes of military personnel -- in 1912 the Bremerton YMCA reported that it had been visited by 57,272 enlisted men.

World War I started to affect Bremerton two years before America's formal entry, when the navy yard began building submarines for Imperial Russia in 1915. (They were not completed before the Bolshevik Revolution, and were bought by the U.S. government to prevent them falling into communist hands.) By the time U.S. troops were sent overseas to fight in 1917, the yard employed 4,000, and that year money was allocated for a third dry dock. By 1918 employment at the yard stood at more than 6,500, most of whom lived on-base and all of whom spent money outside its gates.

Bremerton annexed the town of Manette, just across Port Washington Narrows, in 1918, but the two would not be connected by a bridge until 1930. The 1920 census showed that Bremerton's population had almost exactly tripled in 10 years, growing from 2,993 to 8,918. And although it had refused Bremer's earlier offer, the federal government in 1918 decided to buy up what had been Bremerton's "tenderloin" district, from Front Street down to the waterfront. Front Street disappeared behind the base perimeter, and it and its riotous days came to an end.

Heading for Depression

With peace went the booming prosperity of the second decade of the twentieth century, and Bremerton settled into a period of slower growth. Employment at the base tapered off from the wartime high of 6,500 to bottom out at fewer than 2,500 by 1927, but the town itself had grown to a point that many businesses could survive by serving the area's civilian population and the lessened needs of the military. Homes were being built, car dealerships opened, services expanded, and optimism prevailed.

Bremerton absorbed the next-door community of Charleston in 1927, further increasing its population and tax base. In 1928, construction began on the light cruiser USS Louisville, and employment at the naval yard jumped by 1,000, providing additional flotation to the local economy. In June 1929, just four months before the stock market crash and the beginning of the Great Depression, Bremerton voters passed an $835,000 bond issue to improve the city's water system and to build an electrical plant.

In November, after the bottom fell out of the world economy, work began on a bridge linking Bremerton with the former Manette, now East Bremerton, financed almost entirely by public subscription. When the full effects of the Depression set in, Bremerton, perhaps inured to some degree by the previous economic ups and downs of the naval yard, actually managed better than most towns and cities.

Surviving the Thirties

The Manette Bridge opened to great fanfare in June 1930, and with that completed the people of Bremerton tackled the Great Depression. A Puget Sound Navy Yard Stabilization Bureau was established to lobby in Washington D.C., for shipyard work, and each worker at the yard pledged $5 a year to support its efforts. They also agreed to regular payroll deductions to help support Kitsap County's unemployed, and all employed workers in the county were asked to give up one day's pay a month for the same purpose.

The federal government did its part too, and the shipyard actually expanded during the Depression years. Concerns over Japan's actions in the Pacific led to orders for several new ships. County projects funded by the Works Progress Administration also helped. So successful were these combined efforts that Bremerton experienced record growth in 1934 and 1935, and by the end of the decade its population had increased by half, to over 15,000. By 1940, when the national unemployment rate was still well over 14 percent of the labor force, Bremerton's stood at just 6.9 percent. Bremerton was doing well, and in 1937 its incorporated status was upgraded to city of the second class.

Business was good enough that the Bremerton Chamber of Commerce, which had been in existence since 1907, saw fit to formally incorporate in March 1938. The incorporation papers were signed by its treasurer, William H. Gates Sr., grandfather of Microsoft co-founder Bill Gates. And during the late 1930s and early 1940s, Bremerton was also home to the controversial founder of the Church of Scientology, L. Ron Hubbard.

More War, More Work

The global disaster that was World War II was a huge boon to Bremerton almost from day one. Five of America's warships damaged during the Pearl Harbor attack of December 7, 1941, were towed or limped under their own power into what was then called Navy Yard Puget Sound for repair. Soon the city fashioned itself "Home to the Pacific Fleet," and its population ballooned to as many as 80,000, including more than 32,000 shipyard workers. With most working-age men being sent off to fight, they were replaced in the shipyard by wives and girlfriends, marking a major cultural shift and helping give rise to World War II icon "Rosie the Riveter."

Bremerton during this era was filled with young people, and with the shipyard running three shifts, dances were held at all hours of the day and night, including afternoon USO-sponsored affairs on the decks of dry-docked aircraft carriers. But housing all these new people was a challenge that was never fully met. Two housing developments, Westpark and Eastpark, were built early in the war by the federal government and a third, Sheridan Park in East Bremerton, somewhat later, but they didn't nearly fill the need. Tents and trailers abounded, and people lived in converted garages and chicken coops. "Hot-bedding," in which workers on different shifts would alternate sleeping in the same bed, was common. By the end of the first full year of war Bremerton had 69 apartment houses, four hotels, three hospitals, six theaters, six dance pavilions, and nearly 6,000 students enrolled in its schools. Also in 1942, Bremerton's incorporation status was upgraded again, to city of the first class.

With this latest boom, and with Prohibition no longer the law of the land, alcohol, gambling, drugs, increased crime, and other social ills again became more visible. The city's police force increased from 12 officers to 54 during the course of the war. But this time there were no threats to pull work away from the shipyard; it was simply too critical to the war effort, and a certain tolerance took hold during those years of crisis, especially for the occasional indulgences of sailors on leave.

One controversy that did cause friction with the federal government was the Bremerton Housing Commission's practice (which it denied at the time) of separating black and white workers and families in allocated housing. The federal census counted only seven "negroes" in Kitsap County in 1940, but by 1945 the number exceeded 4,500. Although Bremerton had largely shunned the resurgent Ku Klux Klan during the 1920s, there was still a deep strain of white fear and bigotry. During the war years, most African Americans, and virtually no whites, were assigned to live in the Sinclair Park area of West Bremerton, and many downtown businesses posted "Whites Only" signs. Well-known Bremerton activist Lillian Walker (b. 1913), the wife of a shipyard worker, started her long career in civil rights in 1941 by organizing protests at the navy base against such discrimination. Despite these actions and steady pressure from the federal government, the practice of de facto segregation persisted after war's end, and it took until the 1960s for the last vestiges of overt racism to recede.

On December 1, 1945, the name of Navy Yard Puget Sound was changed to the Puget Sound Naval Shipyard, and with the end of World War II Bremerton had reason to worry about its future. A labor force that had peaked at 32,000 was reduced to 9,000 by the end of 1946, and the estimated 80,000 peak population of the war years dropped to 27,678 in the 1950 census. But there were a few bright spots. In 1946 the Bremerton School District opened Olympic Junior College (now Olympic College) and admitted 575 students to its inaugural class, and in 1948 its first graduates were honored with a visit by President Harry S. Truman (1884-1972). The state took over operation of the college in 1967 and still runs it today.

Then, once again, Bremerton was helped by war. North Korea invaded South Korea on June 25, 1950, and the yard was put to work recommissioning mothballed warships. The respite was temporary -- when a truce was signed in July 1953, Bremerton entered an extended period of stasis, to be followed three decades later by a steep decline.

Doing Without War

With the huge population decrease after the war, Bremerton found itself with too many buildings for too few people, and it showed. The economy was not particularly bad during the 1950s, but the city took on a somewhat desolate and semi-abandoned air simply because it had been overbuilt during the war years.

City tourism got a boost in 1955 with the coming of the famed USS Missouri, on the deck of which the Japanese had signed their formal surrender on September 2, 1945. The Iowa-class battleship stayed in Bremerton as part of the Pacific Reserve Fleet before being reactivated in 1985. Bremerton fought to get the "Mighty Mo" back when she was again retired in the 1990s, but the venerable battleship ended up in Honolulu.

By the 1950s the Manette Bridge, despite being partially rebuilt in 1949, had become totally inadequate for the traffic volumes across Port Washington Narrows. In 1958 the four-lane, $5.3 million Warren Avenue Bridge was completed about a half mile to the northeast of the old span. (In 2011 the 1930 Manette Bridge was demolished. Its replacement span was completed in 2012.)

The days of wars fought with vast navies seemed over, and the government's demand for new ships diminished. The Puget Sound yard did build two guided missile frigates in the late 1950s and kept fairly busy refurbishing existing ships. But it was not enough to fuel growth, and the 1960 federal census showed that Bremerton's population shrank slightly in the preceding decade.

Years of economic ups and downs had made city leaders quick on their feet, and one of their most ingenious moves was the annexation of the Puget Sound Naval Shipyard in 1961. This was done by simply extending the city's eastern boundary to the center of Sinclair Inlet, thus encompassing the base. Mayor H. O. Domstad (1909-1991) was not at all coy about the reasons for the annexation. With 10 ships due to arrive at the base by April 1961, the mayor calculated that the move would add at least 10,000 military personnel to the city's official population. Since the state distributed $13.18 per person per year to its cities, Bremerton would reap more money at a time that it was badly needed.

A Series of Unfortunate Events

At the end of the 1960s, Bremerton could be proud that it had survived and largely prospered for seven decades, through war and peace. But in the last three decades of the twentieth century the town hit a patch of bad luck that almost brought it to its knees, and from which it has yet (2010) to fully recover. An indication of how bad things were can be found in the population figures. In 1970, Bremerton's population was 35,301. Thirty years later, it had increased by less than 2,000, to 37,259.

Even at the start of the 1970s, thing were not rosy: The unemployment rate in King County was 6 percent; Bremerton's was almost double that, at 11.9 percent, and every slight downward tick in that number represented not a new job, but the migration of another working family. William Brenner's son John, who had managed the family's extensive holdings in downtown Bremerton, died in 1969, and his younger brother, Edward, was a poor manager. Leases expired and weren't renegotiated; necessary upkeep and repairs went undone; even the valuable waterfront property owned by the family sat largely unused except for parking cars.

A major blow came when the federal government selected Bangor, located on Hood Canal about 12 miles north of Bremerton, as the home port for the first squadron of Trident nuclear submarines. The Bangor facility, which had served as a humble ammunition depot from 1942 until 1973, suddenly became the new center for military construction and spending on the Kitsap Peninsula. The demand for labor to convert the old depot to a modern submarine base drew workers and their families away from Bremerton and towards Silverdale, which stood about half way between Bremerton and Bangor. After adding nearly 10,000 residents between 1960 and 1970, Bremerton grew by less than a thousand over the next decade.

At Silverdale, a sleepy little unincorporated community in central Kitsap County, a subsidiary of the Safeco Insurance Company started building the huge Kitsap Mall. It opened in 1985 and quickly replaced Bremerton as the dominant commercial center for the entire Kitsap Peninsula. The J. C. Penney store was first to pull out of downtown Bremerton and move to Silverdale, and this led to more defections. Sears, Montgomery Ward, Nordstrom Place Two, Woolworth, and Rite Aid all closed their downtown Bremerton stores in the 1980s and early 1990s, and soon the commercial core of the city consisted of street after street of empty windows staring out from empty spaces. Edward Bremer died in 1987, and the properties were placed in a trust controlled by Olympic College, which seemed equally unable to do anything to break the downward spiral.

The death of Bremerton's commercial district had many causes, but to many the primary blame belonged to the family that gave the city its name. Wally Kippola, a past president of the Kitsap County Historical Society and former director on the Central Kitsap School Board, told the Seattle Post-Intelligencer in 1998:

"What drove people to Silverdale and out of Bremerton was the parochial attitude of (the late) Bremer brothers (John and Ed), whose father founded Bremerton and who owned most of the property there" (Seattle Post-Intelligencer, June 20, 1998).

That may have been a harsh judgment, but it was more than a little true. It is a sad irony that a city started through the initiative of one generation of Bremers was nearly destroyed by the ineptitude or inaction of the next.

Signs of Life

In June 1977 the Bremerton city council passed a resolution designating virtually the entire urban core of the city a "blighted area," a first step to obtaining expanded powers for urban renewal under state law, including enhanced powers of eminent domain and taxation. Much of the "blighted area" was still in the hands of the Bremer family, and Bremerton clearly was fed up with Edward Bremer's unwillingness or inability to make better use of his holdings.

Twenty-five years later, little had been done. The J. C. Penney building and most of the downtown core still sat vacant. In January 2003 a city ordinance acknowledged that "conditions have not changed since those designations (of blighted areas) to warrant repeal of said designations ..." (Bremerton City Ordinance No. 4830). In 2000, Bremerton voters had rejected a ballot proposal to create a recreational center in the downtown area, and the Bremer Trust, established by the brothers, had maintained for years that it wasn't economically feasible for it to subdivide large commercial buildings for rental to multiple small businesses.

But the logjam was actually loosening. In 2001 the city adopted a Downtown Revitalization Plan. The following year, the city council appointed the Kitsap County Consolidated Housing Authority to oversee the city's community renewal efforts. In 2003, ground was broken for the Norm Dicks Government Center and City Hall, and it opened its doors in November 2004. In that same year, the adoption of a Comprehensive Plan gave additional impetus to the city's revitalization efforts. Also in 2004, a conference center with a hotel, restaurant, offices and shops opened next door to the ferry terminal, and another hotel and a tunnel to redirect ferry traffic from downtown streets were under construction.

The arts are being seen to, as well. In July 2005, Bremerton's city council passed an ordinance establishing the Bremerton Arts Commission and enacting a

"1% For Arts" program which requires all city-funded capital improvements to allocate 1 percent of their construction cost to support public art projects. A downtown Arts District centered on 4th Street and Pacific Avenue hosts monthly "First Friday Arts Walks," and there are also "Last Saturday Arts Walks" in the Charleston district of West Bremerton. The downtown Arts District features several fine galleries, three museums, two performing art stages, unique shops, various restaurants and cafes, and clubs featuring jazz and other live music.

Among the art on permanent display are the sculptural fountains of Harbour Fountain Park and at least four other public sculptures, one of which, a two-part piece entitled "Fish and Fisherman," has not been free of criticism since its installation in 2010 on diagonal corners at 4th and Pacific. But disputes about the merits of individual art works aside, the welcoming civic atmosphere, city-sponsored programs, relatively low prices for commercial space, and a core of established artists, galleries, and workshops should ensure that Bremerton's art scene continues to make major contributions to the city's eclectic personality.

A major boost came in late 2007, when the Bremer Trust agreed to sell the long-vacant J. C. Penney building to Ron Sher, a Seattle developer. Sher announced plans to create a new downtown commercial center, with a bookstore, health facility, restaurant, residential units, and a large commons area for community use. Also in 2007, the city opened the 2.5-acre Harborside Fountain Park as part of its Harborside Redevelopment Plan, and in May 2008 the Port of Bremerton dedicated a greatly expanded 300-slip marina.

Once again, however, events much larger than Bremerton's local concerns conspired to hamstring the city's economy and stymie its redevelopment plans. The global financial crisis that started in 2008 slowed or halted progress on several proposed projects, including the redevelopment of the J. C. Penney building, and many slips at the new marina remained unfilled. But there was one big difference this time, and reason for optimism. Bremerton had to look beyond its historical reliance on the military and by 2010 the city had on its books a detailed blueprint for urban revitalization and a more durable and stable economic footing.

History of Bremerton Chamber of Commerce

https://www.bremertonchamber.org/history-of-the-chamber/

Serving Bremerton for over 100 Years!

Although the Bremerton Chamber of Commerce celebrated its 100th birthday in 2007, most people would be surprised to know that chambers of commerce existed in this country before we even became a country! The first chambers of commerce were formed in the colonies in the 1760's. And they've been growing stronger ever since.

The Bremerton Improvement Club began in the year 1902. The Bremerton Board of Trade was started in 1904. The Board of Trade absorbed the BIC, and was organized to promote PSNS and the affairs pertaining to the well being of Bremerton. The name was changed to Bremerton Chamber of Commerce in 1907.

Early history shows the Board of Trade/ Chamber helped to secure the US Navy staying and growing in Bremerton. In 1903 the Navy almost moved from Bremerton due to the 'shadiness' outside it's gates, which included Bremerton business selling alcohol, and other colorful activities.

Also the Chamber in 1908 aided by getting outside investors from Seattle to supply the capital for building housing for the military and their families.

Airport and Incorporation

In 1935 the Bremerton Chamber of Commerce proposed the plans for a landing field in Gorst which grew into today's Bremerton Airport. In 1938 the Chamber incorporated. It's interesting to note that the Treasurer of the Board of Directors was William Gates, grandfather of Microsoft founder Bill Gates. The Gates family owned a furniture store in downtown Bremerton and William Gates signed the Chamber's Articles of Incorporation.

Pier 5 is somewhat famous, because it is where the steamer Spokane, carrying President Theodore Roosevelt, landed in Seattle, with great fanfare, on May 23, 1903. Early on the pier was known, along with Pier 4, as one of the two Arlington Docks. The Arlington Dock Company operated as an agent for steamships carrying passengers from several West Coast cities to Alaska, Asia and Europe. The pier is best known, however, as the base of operations for Frank Waterhouse and Company, which began to thrive during the Klondike Gold Rush. According to Clarence Bagley, during the 1900s, Frank Waterhouse and Company was already one of the major Seattle steamship lines. Frank Waterhouse was considered one of the waterfront's most successful and energetic entrepreneurs. The firm not only provided transportation to the Yukon and Alaska, including a Bering Sea service, but also delivered U.S. Army transports to Manila, during the Spanish American War of 1898-1899. Frank Waterhouse's firm, which also provided service to Hawaii, the Mediterranean and Russia, endured through the end of World War I.

A leading firm which has been intimately identified with the development of Seattle as a port is that of Frank Waterhouse & Company, first established in 1898 by Frank Waterhouse as president, Messrs. Neal H. Begley vice-president, R. D, Smalley secretary, and J. Richard Lane treasurer.

Besides the general offices at Seattle the company has branches in New York, Chicago, San Francisco, Vancouver, Kobe, Singapore and Calcutta.

The firm is especially prominent in the transportation of cargoes between Seattle and other Pacific Coast ports and the Far East, including Japan, China, and the various colonies and presidencies British India.

Earl Winfrey Brian, Jr. (born 1942) is an American businessman who served as Director of California's Department of Health Care Services, and then as Secretary of California's Agency for Health and Welfare under Governor Ronald Reagan. Following an unsuccessful run for the U. S. Senate in 1974, Brian headed several technology based firms during the 1970s and 80s. In 1991 however, Infotechnology, the venture capital firm he headed, filed for bankruptcy. Brian was later charged with conspiring to cover up the firm's financial difficulties and sentenced to four years in prison. Dr. Brian died on November 2, 2020, at the age of 78 in Easton, MD.

Early career[edit]

Brian graduated from medical school at Duke University and served in the Army Medical Corps in Vietnam.[1]

Political career in California[edit]

After leaving the service in 1970, he was appointed first as Director of California's Department of Health Care Services (DHCS), then Secretary of Health and Welfare. During his term as secretary, Brian succeeded in implementing a requirement for a $2 co-payment from Medi-Cal recipients for each doctor's visit,[2] but failed in an attempt to curtail medical benefits available under Medi-Cal when the state lost a suit brought by the California Medical Association.[3] In 1974 Brian resigned his cabinet post and ran for the U.S. Senate seat held by Senator Alan Cranston (D–CA), but lost the Republican primary.[1]

Business and expansion[edit]

Brian then turned to business and in 1980 established his own company, Biotech Capital, a venture capital firm that invested in companies developing medical technology.[4] Biotech later shifted its focus to news and information services, acquiring interest in the Financial News Network (FNN) and changing the name Biotech in 1987 to Infotechnology.[4] In 1988, the company acquired United Press International, one of the two major American news wire services at the time.[1]

Conspiracy and fraud conviction[edit]

Infotechnology encountered financial difficulties and filed for bankruptcy in 1991, as did FNN and UPI.[5] In 1995, Brian was charged with conspiracy and fraud for inflating the value of FNN and UPI in an attempt to secure loans to shore up the companies.[6] He was convicted of the conspiracy charges in 1996 and sentenced to four years in prison.[7]

[HL005T][GDrive]

Dr. Earl Winfrey Brian, Jr., died on November 2,2020 at the age of 78 in Easton, MD.

Earl Brian, born February 26,1942, the only son of Earl Winfrey Brian MD. Sr and Blanche Barringer Brian, spent his youth in Raleigh, NC. Early on, he excelled in academics and quickly developing the remarkable intelligence and determined confidence that became part of his life-long personality.

Following the footsteps of both his parents, he enrolled at Duke University at age 16 and entered Duke Medical School at age 19, graduating in 1965. He accepted residency at Stanford University Medical Center Palo Alto in their prestigious surgery/neurosurgery program. In 1967, drafted by the US Army, he went to officers training at Fort Sam Houston, then Surgeons' Flight School in Fort Ruckers, Alabama. He was then stationed at the Presidio before serving in Vietnam. There he earned the Bronze Star, the Silver Star and the Air Medal for Valor becoming the most decorated physician of the conflict. He rose to the rank of major prior to coming home at the end of 1968. He never forgot the young men lost in service and the brave men who died there.

During his youth, he fell in love with tennis. He learned to play the game at Royster Courts simply by watching others play. Even though he was self-taught, he won the North Carolina Men's Singles Junior title at age 14. He continued to play tennis the rest of his life with his hitting partner and teacher, Jay Aldridge of Cambridge MD. He loved to watch his children and grandchildren play the game.

Deciding not to pursue a career in the military, he returned to California and worked as a neurosurgeon at University of Southern California School of Medicine. In 1971, after receiving a surprise from the Governor Ronald Regan, he accepted a position working for him. He quickly rose to a cabinet position becoming the youngest director of Health and Human Services in California's history. A staunch Republican all his life, he managed to reach across the aisles on a number of occasions to ensure bipartisan approval. He prided himself on innovative and cost-effective legislation particularly in healthcare. During his tenure, he helped move California from a ranking of 48 out of 50 states in healthcare costs to 2nd out of 50 within 4 years. His innovations included a modest co-payment from patients, the first ever implemented in the country. In 1975, he was awarded One of the Top Outstanding Men of America along with co-recipient, Joe Biden. In 1976, he left Regan's cabinet, but he continued his involvement in national healthcare issues and reforms for many more years. Although he briefly entertained a career in politics, after an unsuccessful bid for US Senate in 1978, he moved on to pursue a business career as an entrepreneur.

He moved with his family to NYC and began several business ventures including Infotech, UPI, Hadron and FNN. He fondly remembered his colleagues and kept up with many of them through the years. His lasting contributions to business include 24/7 financial news updates and ticker displayed prices in real time displayed at the bottom of the TV screen. His goal of providing real time financial analysis on TV was one of the first of its kind. Dr. Brian's work as a venture capitalist began in 1982 and continued until 2017. He invested in many startup companies particularly in health and tech fields, some performing well. During this time, he served as chairman of Duke Hospital Advisory Board.

His Life's passion however, revolved around the mathematical proofs of stock market trends by computer algorithms. He worked on this analysis from age 18 to 75. He felt much gratitude to his long time colleague "Joey" Dong Ping Zhou for their hours of work together. He much appreciated the work of Kan Devani as they spent many hours discussing business plans.

In passing, he is predeceased by his parents, Earl Sr. and Blanche. He leaves behind his wife, Molly (Mary) B. Brian, MD and children: Earl W Brian III (Nina), Jennifer M Brian (Chet), Natalie Dent, Christopher Brian (Ellen), Alexandra Brian and stepson Robert A Burgoyne (Laura). His grandchildren are: Earl W Brian IV (Winn), Baron Brian (Bo), Audrey Dent, John Dent and Vivian Brian. His beloved sisters, Betsy Rollins and Leigh Cooper also survive him; as well as, his first cousin Henry Hawthorne (Beth); and his nephew Dave Schmickel (Amy) and the Schmickel family. His step grandchildren are Connor and Emelia Burgoyne. He owes a debt of gratitude to former wives Jane and Diana and all those who supported him in good times and bad.

Earl Brian will be buried at Arlington National Cemetery with military honors at a future date. In lieu of flowers, consider a donation to local charities he thought highly of:

Shirley Armitage Chidsey Bridgwater (born 1907)

1936 - Age 29

1936-09-07-the-san-francisco-examiner-pg-24-clip-mrs-dbchidsey-1.jpg / https://drive.google.com/open?id=15Z5L7nxQPLmkN8_iynL7qlT0rrsT3s52

INTRO

"**Shirley Armitage Chidsey [Bridgwater]** was born in Philadelphia in 1907, and later married **Donald Barr Chidsey (born 1902)** , a novelist and biographer. Shirley worked as an editor and assisted Charles Nordhoff and James Norman Hall, both authors, on The Bounty Trilogy (The Mutiny on the Bounty, 1932; Men Against the Sea, 1933; and, Pitcairn's Island, 1934). Later, Shirley became an assistant editor at Knopf. She stayed in publishing most of her. After divorcing Donald Barr Chidsey, she remarried and took on the name Shirley Bridgwater. This book has an excellent provenance and was purchased from an estate of one of Shirley Chidsey's relatives in Philadelphia . ." (See 2019-07-mtgothictomes-com-f-scott-fitzgerald-pg-23.pdf / https://drive.google.com/open?id=14v1fI0jt2K7gmb5R49R9qWdhrgqoTUmJ)

*"**Shirley Chidsey** [was] born **Elinor Shirley Stewart** [.] Her features were plain, but she had an intelligent, independent, and lively air, which made her almost beautiful. OSS files record that she had grey eyes, brown hair, a fair complexion, and petite build: just five foot one inch tall, weighing 52 kg."* [aa1][GDrive]

Up to 1930

The San Francisco Examiner (San Francisco, California) · 07 Sep 1936, Mon

1 of 2 matches donald barr chids

And we remember MR. and MRS. DONALD BARR CHIDSEY, he a one-time newspaperman turned author. Biography, as we recall, is mostly his dish, and it seems to us that the latest studies of Sir Francis Drake and Sir Walter Raleigh are those that have come from his pen. Right now, though, he's looking for material on anything he can get. If he finds it in Hawaii (he, too, was a Malolo customer) he'll pause to note it there. If not, he may continue on to some other part of the world.

His wife, until she married him a year or so ago, was secretary to Author J. P. Marquand, so she's well used to writers. A little queer as a breed, she says, but not so bad after you get to know them.

1940 - EARLY 1944

From a review of The Female Spy Who Kept Uranium Out of the Nazis' Hand : See [aa1][GDrive]

In August 1939 Albert Einstein signed a letter to President Franklin Roosevelt, warning of the potential of Adolf Hitler's Nazi regime to use uranium to develop an atomic bomb. "The most important source of uranium," he added, was in Africa—in the Belgian Congo (now the Democratic Republic of Congo). It was therefore a priority for the U.S. to build its own bomb and to secure all available Congolese ore. But there was a risk that uranium might be smuggled out of the Belgian colony to Germany. To prevent this, the 🌐 **Office of Strategic Services (OSS)** , America's new intelligence service and forerunner of the CIA, established a station in the Congo. The station's agents included a courageous woman named Shirley Chidsey, one of the small number of women OSS agents to serve overseas.

[...]

When the U.S. entered the war, **[Shirley Chidsey]** joined the Office of Strategic Services in New York as a stenographer in French. As a woman, she was in a minority in OSS, which was dominated by men and male attitudes. The Ivy League universities that most of them had attended "were all male, and the OSS was very heavily so." One agent, Elizabeth MacDonald, wrote a memoir after the war entitled Undercover Girl, which describes the sexism of the organization. "Women have no place in the war," one colonel told her dismissively. "All the time I've put in overseas—and that's four years—I've only come across one who was worth her salt." When General William Donovan, the head of OSS, gave instructions about the "right types" of women to be hired, one definition of right type was a Smith graduate who could pass a filing exam. Most of the 26,000 women who joined OSS worked in the secretarial field and only a small percentage—some 700—served overseas.

These attitudes held women back. But Chidsey was eager to serve overseas and when an opportunity came up in French Equatorial Africa in 1943, she jumped at it, though it meant leaving OSS. The post was that of transcriber at Radio Brazzaville, a radio transmitter beaming propaganda on behalf of Free France. This, thought Chidsey, would be an ideal way of doing her bit for the war.

But she was unhappy in Brazzaville and wondered if it might have been better to join the Women's Army Auxiliary Corps. "Rather wish," she mused with feeling to her mother, "I had joined the WAACS tho' and perhaps got to North Africa with them." It was not all bad news though. "But I did have one nice thing happen," she reported home. "I had dinner with a handsome naval officer and sat on his terrace overlooking the Congo and saw the full moon rise big & red out of the dark river and had a tall whisky and soda …"

Then another nice—but far more significant—thing happened: she was able to return to OSS. But this time, it was to work not in the New York office, but in the OSS station in Léopoldville (now Kinshasa), the capital of the Belgian Congo. In Brazzaville she had met Dock Hogue, the OSS chief of station in Léopoldville, on the opposite side of the Congo River. Thirty-four years old and just short of six feet three, Hogue was athletic and strikingly good-looking, with a narrow moustache. A sombre and very clever civil engineer, he nursed a dream of becoming an author. But for now, he was carrying out a top secret mission for his country: keeping Congolese uranium out of the hands of the Axis powers. His cover was the investigation of diamond smuggling and his codename was TETON.

Hogue and Chidsey had much to talk about, including their shared interest in literature. They were also both isolated and lonely. Shirley told Dock about her "urgent desire to escape Brazzaville" and her "extremely disagreeable living and working conditions." He suggested that she cross the river to Léopoldville, to become his assistant. No doubt he felt sorry for her. But he was also overburdened with work and she seemed ideal: she spoke French fluently and had even worked previously for OSS.

Hogue asked Rud Boulton, the head of the Africa Section in Secret Intelligence at OSS headquarters in Washington, for permission to hire Chidsey. It was vital that he had "a loyal and competent person" he could trust, he pointed out, since he was the only OSS representative in the Congo. It was essential, he argued, that the secretary in Léopoldville be herself "of 'agent stature' … [and] she must have complete loyalty to OSS and the proper feeling for the security of operations."

Boulton was impressed by Chidsey's record and in December 1943 he initiated a security check and sent some inquiries. A question about sports and hobbies elicited an arch response: "None particularly." When asked if she had ever used intoxicants, she responded: "The usual 'occasional cocktail.'" By late January 1944, she had been cleared to work for the Africa Section of OSS. Her codename would be ANGELLA and her codenumber would be 1080.

The OSS station was transformed by Chidsey. It had been over nine months since Hogue had first arrived in the Congo—a period of intense difficulty, sickness, and excessive travel, in the context of harsh colonial racism and severe inequities. But he no longer had to worry about leaving the office unattended and, in addition, ANGELLA was adept at cultivating informants and information. Hogue was proud of the information he and Chidsey sent to Washington. "How does our little office stack up for volume?" he inquired. "I won't ask about quality," he commented with his usual self-effacing humor, "because that is always a problem."

Chidsey was also good company—a smart, kind, and funny woman, with unusual hobbies—she was an enthusiastic railfan and avid reader of Railroad Magazine, a journal devoted to trains. This interest was useful, given the importance of the Congo's vast rail networks to the export of uranium ore to America.

JULY 1944 -

From a review of The Female Spy Who Kept Uranium Out of the Nazis' Hand : See [aa1][GDrive]

In July 1944 Hogue and Chidsey were joined by Henry Stehli, a sophisticated but easygoing man whose cover was his role in the family business—the famous Stehli Silks Corporation; his codename was LOCUST. The OSS station appeared to be growing steadily. But just days before Stehli's arrival, Hogue's cover was unexpectedly blown open, putting him in danger of his life. He was also vulnerable as a result of information he had gathered about collaboration between businessmen and senior policemen in the Belgian Congo with the Nazis.

Realizing he may have to escape at any moment, Hogue prepared to hand the station over to Stehli. "ANGELLA knows pretty well what our files contain, and can be of assistance in this respect," he told him. "Her memory is excellent regarding names of persons on whom we have dossiers, and can save you a lot of time." But he was concerned about her. If she were to leave the Congo, she would need a flight with Air Transport Command, which was extremely difficult for women. "After six months service with us," he hoped, "she should be made eligible for ATC transportation to the United States … I personally feel that her services merit this consideration." Her work, he said, was very good: "ANGELLA has tapped a mine of information in Poskin, the news editor of L'Avenir Colonial Belge." So, he added with self-mocking humor, "except for the Chief who can't stay out of trouble, things are going along pretty well."

Hogue survived two threats on his life. But when he was attacked by a gunman in his bedroom at home, he immediately implemented his plan for escape. Stehli took over, relying on ANGELLA as "a loyal and trusted agent." But he became very ill: a thin and exhausted shadow, who had no choice but to leave the Congo in April 1945.

This meant that Shirley Chidsey became de facto chief of station. She was now based in the U.S. Consulate and sending reports to OSS. "1080," noted Boulton in Washington with evident approval, "is developing rapidly into a competent source during this interim period."

***

After Germany surrendered in May 1945, there was no longer any reason to fear a German atomic bomb and, in any case, Nazi Germany had failed to build one. Leading German physicists attributed this failure to the lack of uranium ore, which can be considered a tribute to the clandestine OSS mission in the Congo. OSS operations in Africa were now being reduced, but the station in the Congo was maintained. In June 1945, a senior OSS official flew to the Congo to arrange cable communications for ANGELLA. There were now "1 secretary at the Léopoldville station, 4 informants regularly used, and 1 undercover agent."

But in September, OSS representation ceased in the Congo too, "with the official closing of the Congo office by 1080," who left Africa. Very shortly afterwards, President Truman abolished OSS.

Chidsey returned to the Congo in January 1946 to work for the U.S. consul. Boulton arranged with the State Department for her to send reports back to the Central Intelligence Group, which had replaced OSS. "Anything you hear from me so far," she wrote to Boulton, "is completely unofficial and unsponsored. I shall keep it up to whatever extent seems practicable, and meanwhile keep a sort of background file which will be ours … Best to you all, and I miss hearing from you."

Shirley Chidsey finally left the Congo in September 1947. She became editorial assistant on Railroad Magazine and then worked on literary projects as an editor, including a translation of The Pillow Book by Sei Shōnagon. She remarried, taking the surname Bridgwater. Neither she, Hogue, nor Stehli received any recognition of any kind for their brave contribution to the fight against fascism.

Chapter 21 ("Atomic Spies") in the book "Spie2 in the Congo") : 2016-spies-in-the-congo-americas-atomic-mission-in-ww2-susan-williams-ch-21-ocr.pdf / https://drive.google.com/open?id=148rwgILKmGrEZJwpN7eu6OYHSq9Fjvkj

Shirley Chidsey [...] *returned to the Congo in late January 1946 to continue working for the US Consul, Robert Buell. Boulton arranged with the State Department for her to be allowed to send reports back to the Central Intelligence Group, which had replaced OSS. She was given a new code number - 987/50 - and stayed at La Rotonde, a simple but popular hotel attached to a cafe and restaurant. 'Anything you hear from me so far,' she wrote to Boulton, 'is completely unofficial and unsponsored. I shall keep it up to whatever extent seems practicable, and meanwhile keep a sort of background file which will be ours Best to you all, and I miss hearing from you.'*

After finally leaving the Congo in September 1947, Chidsey became editorial assistant on ***Railroad Magazine****; by 1951 she had left this position but was still contributing to the magazine. She worked on a number of literary projects as an editor and co-edited a translation of* ***The Pillow Book*** *by the Japanese writer Sei Shonagon. While doing this work in New York, she met* ***Dr William ('Bill') Bridgwater****, who was Editor-in-Chief of Columbia University Press. They married in 1955 and Shirley found married happiness for the first time; she and Bill lived peacefully together in Harlem and enjoyed outings to watch the Yankees play baseball. After only nine years, Bill died. Shirley was bereft but resolved within less than ten years to start a new adventure. Though well into middle age, she moved to Austin, Texas, in 1974, where she worked at the state university on literary projects. She died on 27 September 1987.*

1987 (Oct 1) - Passing of Shirley A. Bridgwater

NOTICE TO ALL PERSONS HAVING CLAIMS AGAINST THE ESTATE OF SHIRLEY A. BRIDGWATER

Notice is hereby given that original Letters Testamentary for the Estate of Shirley A. Bridgwater were issued on the 7th day of December, 1987, in Cause No. 53,000, pending in the Probate Court No. 1 of Travis County, Texas, to:

Lawrence M. Hermes

The residence of such Executor is Harris County, Texas. The post office address is: c/o William D. Bryce
Attorney at Law
511 Main Street
Georgetown, Texas 78626

All persons having claims against the Estate which is currently being administered are required to present them within the time and in the manner prescribed by law.

DATED the 14th day of December, 1987.

William D. Bryce
Attorney for the Estate

2 Arrested, 2 Still Sought In Sale Of Electronic Goods To Soviet Bloc

Associated Press

LOS ANGELES — Two persons have been arrested on charges of selling bugging devices and other strategic technology for shipment to the Soviet Union.

The arrests were made Wednesday, shortly before those two and two other persons were charged in a 60-count indictment handed up by a federal grand jury in Los Angeles.

Arrested were Anatoli Maluta, 61, a Soviet-born U.S. citizen who lives in Redondo Beach, and Sabina Dorn Tittel, 31, of Rancho Palos Verdes. Assistant U.S. Attorney Theodore Wu said they would be arraigned Monday. Both were held in lieu of $800,000 bail.

Still being sought are Werner Bruchhausen, 42, of West Germany, and Dietmar Ulrichshofer, 41, of Austria. "They're overseas for sure," said Alan Walls, deputy regional director of U.S. Customs. Authorities indicated they were probably in Europe.

Neither Walls nor Wu would say how the case was broken, although Walls said the investigation began 18 months ago. Walls said West German authorities cooperated.

"We're talking of a suspected $8 million worth of strategic technology," he said. "We can document and prove approximately $2 million and have a good indication of the remaining $6 million."

Walls said exporting such technology illegally is common: "It's also common that . . . it is exported to friendly countries and then diverted to hostile countries. It's difficult (to prove intent) but it's possible and we think we have," he said.

The indictment charged that during 3½ years ending in June 1980, the four conspired to ship strategic technology to West Germany and elsewhere without obtaining U.S. export licenses.

Maluta, Bruchhausen and Ulrichshofer were accused of exporting electronic monitoring and communications systems, computer components, semiconductors, manufacturing and testing equipment.

Maluta and Ms. Tittel allegedly told their employees to tell manufacturers the items were being purchased for Maluta's security business and facilities in Arizona and Alaska, officials said.

Bruchhausen owns and controls six California technology corporations and two West German corporations. Maluta, an officer and director, controlled the daily operations of the six California firms.

Named as an unindicted coconspirator was Hans Koenig, a West German and owner of a company called Elmasch, which allegedly sold high technology products from the United States to Soviet-bloc countries.

Sales To Dr. Guenther Forgber

German Customs Agent Ulrich Schulz and U. S. Customs Agent Roger Urbanski developed information on June 23, 19S1 indicating that the Watkins-Johnson 900 microwave receiving systems had not been sold to the Yugoslav Defense Ministry but directly to Mashpinborintorg in Moscow. It was reported that only one of the Fairchiid/Xincom memory test systems was sold to Tungsram of Hungary and three had been sold to Dr. Guenther Forgber of East Germany.

Schulz and Urbanski obtained documentation from Ulrichshofer's sales of American manufactured electronic equipment to Soviet and Soviet Bloc customers including the sale to Dr. Guenther Forgber of Narda microwave amplifiers and power dividers and a Fairchild automatic testing system and Xincom manuals; and to Mashpinborintorg of Moscow of Watkins-lohnson 9*0 microwave receiving systems, manuals and tuners.

Koenig Described Work In CTC Syndicate

On June 6 and 12, 1981, Hans-Juergen Koenig was interviewed in the U. S. Embassy in Bonn, West Germany by Stephen Dodge of the U. S. Customs Service, Robert Rice of Commerce and Theodore Wu, an Assistant U. S. Attorney in Los Angeles.

Koenig, reciting his recollections in fluent English, said that he first went to work for the CTC group of companies in June of 1977, serving as general manager of Analog and Digital Technik, or ADT, of Dusseldorf.

Koenig said ADPs sales were largely electrical components to West German firms but one department of the enterprise, managed by Sybille Ziogas, was devoted exclusively to the sale of electronic equipment to the Soviet Union. Ziogas worked in ADT from August of 1977 until late 1978 when she joined another CTC entity.

His tour at ADT lasted six months, Koenig said. While he was not trained in technical matters, Koenig did learn the technical side of the business and how the

CTC enterprises operated. Koenig came to realize that ADT had two principal interests — sales to West German firms, and sales to the Soviet Union.

CTC executives explained to Koenig that all sales by ADT to the Soviet Union were made through Electronorgtechnika, also known at Elorg, the Soviet state purchasing agency for electrical components, test equipment {or components and computers. Koenig said he learned while working (or ADT that the CTC group bought most of the electrical components and computers for the Soviet Union from the United States. Koenig said CTC was managed by Tony Maluta, a Russian born American who spoke English, German and Russian and who had technical experience and knowledge of high technology equipment. Maluta was assisted by Sabina Dam Tittel, a German woman whom Koenig met for the first time in Dusseldbrf in 1977 shortly after he joined ADT.

It was the opinion of CTC executives in Germany that AOTs sales of American manufactured high technology to the Soviet Union did not violate German laws because the goods never formally entered West Germany but instead were only "in-transit" — or passing through — in route to Switzerland and then on to the U.S.S.R-, Koenig said. They felt they were breaking no law when they shipped high technology freight through Vest Germany and on to the Soviet Union with no German export licenses.

But Koenig doubted this legal interpretation, pointing out that export licenses were required for freight shipped "in-transit* through Vest Germany and that it was apparant that Vest German authorities never knew about CTCs sales to the Soviets.

West German executives of CTC also held the legal opinion that Tony Mahitas shipments out of the U. S. did not require American export licenses because Maluta declared the shipments in a deceptive way, describing them in deliberately vague terms such as "electricals." Because their destination was Vest Germany, CTCs shipments were undetected.

However, Koenig said, CTC officials knew that if they had listed the Soviets as recipients of the goods, export licenses would have been refused. Koenig said Tony Maluta declared Fairchikl/Xincom computer equipment as being "electricals" when he knew the machinery was more sophisticated than that. Because of Maluta** "deceptive methods," Koenig said, he believed that Maluta recognized the legal requirement for proper export licenses was being circumvented.

While he was learning ADT procedures, Koenig said, he had differences with management over how the firm should be run. The differences led to Koenig's quitting ADT. However, he remained on good terms with ADT. In fact, company officials put up »,000 Deutschemarks of their own money to enable Koenig to establish another enterprise, Elmasch, GmbH. The founding of Elmasch enabled Koenig to put into practice an idea he had of selling electrical and computer components to the Warsaw Pact nations. Koenig explained how and why Elmasch came into being:

- By early 1978, 1 was knowledgeable of ADT's methods of doing business with the Soviet Union. During this period, 1 discussed.. .my ideas about doing business with the other Eastern Bloc nations. As part of my attempts to establish business contacts with the Soviet Bloc customers after the establishment of Elmasch, I attended a trade fair in Hannover, West Germany, in April, 1978. At that time, I anticipated selling electrical components and semiconductors to my customers, but I learned that certain electric components were very easy for Soviet Bloc customers to obtain from West Germany and Austria. I determined that.. ..the price for such components was relatively low and their sale to Eastern Europe was not profitable. In about Tune, 1978, I obtained from Bulgaria an inquiry for U. S. ball-bonding , die-bonding and etching equipment used in semiconductor manufacturing, and this inquiry became an official order in September, 1978. This inquiry was sent by me in Bulgaria to ADT then to Maluta at CTC... Later on, less than a week after my return from Bulgaria, ...I talked with Tony (Maluta) about this inquiry by telephone from ADT's office, using a telephone loud speaker.

While Koenig was in the process of setting up Elmasch, GmbH, he established another business, Techma, GmbH, to take over ADT's transactions with the Soviet Union. ADT officials wanted to have no further sales to the Soviets. Koenig was listed as Techma's general manager but Sybille Ziogas, who had supervised ADT's Soviet sales, took on the same assignment with the new entity.

CTC executives held a party in April or May of 1978 near Dusseldorf which was attended by about 20 persons, including Maluta and Koenig. Koenig and Maluta were told to get to know each other and to be on good terms.

Koenig discussed an order he had received from Czechoslovakia for Intel 2708 integrated circuits and an Intel microcomputer develoment system model MDS231. Maluta's judgement was that Koenig was on the right track in planning to use Elmasch, GmbH, as a vehicle to supply Eastern Bloc orders. Maluta told Koenig to accept orders from Warsaw Pact nations and to transmit them directly to him at CTC in California. Maluta said there would be "no problem" with CTC delivering U. S. machinery to Elmasch.

Koenig said he frequently heard CTC officials talking long distance with Maluta. They talked about the availability of machinery and prices. It was obvious what they were talking about, Koenig said. CTC executives in Germany were afraid their telephones were monitored and were careful not to mention Soviet Bloc customers by name.

Koenig remembered one telephone conversation between one CTC executive and Ualuta that he overheard on the loud speaker. The two men discussed a possible order from Bulgaria which Koenig knew about. But neither man referred to Bulgaria or the prospective buyer by name.

The circuitous nature of the telephone conversations did not prevent Maluta from knowing what was happening, Koenig said. Maluta knew that alt the orders from Elmasch were from Eastern Bloc nations.

The Soviets' invasion of Afghanistan in late 1979 triggered new U. S. government assurances that the flow of high technology to the Soviet Bloc would be made more difficult. The grain embargo was imposed and, Koenig said, there were indications that illegal shippers like Maluta were likely to face stronger U. S. export controls.

To prepare for such an eventuality, the CTC group called a meeting with Koenig and Maluta for London in February of 1980. Maluta said a tightening of export controls might be attempted but that they would not succeed, Koenig recalled. Moreover, Maluta added that he had noted no increase in efforts by the U. S. government. In short, Maluta declared, there was no need to devise a new method for shipping high technology out of the U. S. because no new safeguards had been set up. But, Maluta did say that a Commerce Department agent had visited him, a recollection by Maluta which was doubted by both Koenig and other CTC representatives. They believed Maluta was exaggerating the "dangers involved in ordering U. S. goods" as a ploy to get the CTC syndicate to pay him more money, Koenig said.

Horst Jonas, a customer of CTC, was suspected by the West German national police (Bundes kriminal amt or BKA) of having illegal dealings with the Soviet Bloc. The BKA interviewed CTC executives about 3onas. The encounter troubled them to such an extent that they moved ADT to new quarters in Ousseldbrf in 1977 and then moved the company offices to Munich in 1979, Koenig said. Donas was arrested and imprisoned for IS months by German authorities for alleged espionage activities.

Referring to his contention that Tony Maluta was well aware of the activities of the West German businesses in the CTC syndicate, Koenig recalled a conversation he had during the London meeting with Maluta. He told Maluta that Bulgaria was Elmasch's biggest customer. To conceal the true destination

of the Bulgarian shipments, Elmasch gave them the order code of 7200. Maluta knew all 7200 codes were for Bulgarian customers, Koenig said. Similarly, Maluta also knew that Techma, GmbH, was selling to the Soviet Union, Koenig said. He added:

- I am of the opinion that Maluta knew all orders from Elmasch and Techma were for Eastern European and Soviet customers, except for a very small portion of Techma orders for Zabel, a West German firm. My opinion is based on the fact that I told Maluta in May 1978 that Elmasch was set up specifically to do business with Eastern Europe other than the U.S.S.R., and Maluta had to know Techma was selling primarily to the U.S.S.R. because it followed ADT in the Soviet business, and simply was a change of name for business with the Soviet Union already being conducted by ADT.

Early in 1980 CTC executives began to suspect that Maluta and his assistant, Sabina Dorn Tittel, were cheating them, charging them exorbitant prices for U. S. equipment.

On a Monday morning in May, Werner 3. Bruchhausen and Koenig made an unexpected visit on CTC in Los Angeles. Their arrival caused tension between Bruchhausen and Maluta. Later that day the two men quarreled. When Maluta left the offices, Bruchhausen and Koenig searched the files and found evidence that Maluta was overcharging his employer 10 to 20 percent. Bruchhausen fired Maluta and Sabina Tittel.

Maluta's pay, Koenig said, had been $2,000 to $3,000 a month but he was given another $25,000 a month by charging the CTC entities through a fictitious advertising account which CTC executives had agreed to. The CTC executives set aside another $150,000 to be used by Maluta should he be arrested and face big legal fees. Suspicions that Maluta was stealing from CTC were well founded and Koenig estimated that Maluta embezzled about $800,000 from CTC entities.

Koenig recalled his first meeting with Sabina Dorn Tittel, saying he met her in August of 1977 while she was on vacation in Dusseldorf. He said Tittel may not have known about ADT's Soviet sales at the time but that it was his "common sense assumption that Maluta must have told her at some time."

Page 390 to 395

The following summary of the CTC case was written by Fred Asselin of the Subcommittee Minority staff. It is based on information provided by Commerce and Justice Department, U.S. Customs and other sources.

CTC Network Was Formed In 1977

On October 23, 1974, Werner Jurgen Bruchhausen, a 34-year-old West German residing in Los Angeles, incorporated four companies in Southern California for the purpose of buying and selling sophisticated electronic equipment. The firms all used the address of 4676 Admiralty Way in Marina Del Rey. Subsequently, Bruchhausen incoporated eight other entities in Southern California.

Bruchhausen, who was born on November 5, 1939 in Dortmund, West Germany and who listed his home as being D8019 Niederseeon 21 in West Germany, enlisted the aid of two associates in setting up his firms -- Anatolij T. M. Maljuta of 231 Calle Mayor, Redondo Beach, California; and Sabina Dorn Tittel of 30605 Cartier Drive, Rancho Palos Verdes.

Maljuta, who was born in Kharkov, Russia on January 25, 1920, was a naturalized American citizen. He used three aliases -- Anatoli T. M. Maluta, Tony Maluta and Tony Metz. Tittel was born on January 13, 1950 in Gumbsheim, West Germany. Divorced, Tittel was unmarried, as was Bruchhausen. Maluta's wife was named Aida.

Of the four companies Bruchhausen created in 1974, the principal enterprise was CTC California Technology Corporation. From its inception through 1980, CTC utilized 18 other trade styles, 12 of which were incorporated in California. In the four-year period of 1977 to 1980, CTC and its variants, under the direction and supervision of Anatoli Maluta and Sabina Dorn Tittel, purchased high technlogy electronic equipment, peripherals and components valued in excess of $10.5 million. Most of the items they purchased were classified as strategic commodities, controlled for national security purposes and requiring United States export licenses granted by the Departments of State and Commerce.

In the same four-year period, CTC exported from the United States to Germany, the Soviet Union, or the Soviet Bloc more than 300 shipments consisting of strategic commodities. None of the commodities had proper export licenses. The shipments were documented with fraudulent U. S. Shipper's Export Declarations (SED's). Most of the exports were sent to West Germany consigned to companies controlled by or associated with Werner 3. Bruchhausen. From West Germany, most ol the commodities were transshipped to Switzerland or Austria or to other intermediate countries and then transported to the USSR or to a Warsaw Pact nation.

The entities located in Southern California that comprised the Bruchhausen or CTC group were as follows:

CTC Group Used Companies Overseas

In addition to the California-based entities comprising the CTC group, Bruchhausen also controlled or was associated with several other enterprises, including entities in West Germany, Austria and Switzerland.

The CTC group's associates in West Europe included Dietmar Ulrichshofer, Hans-Jurgen Koenig, Sybille Ziogas, and Frank and Karin Nassauer.

Ulrichshofer, born in Austria on May 27, 19*0, owned electronics supply companies in Vienna and Bad Reichenhall, West Germany. Koenig, who lived in Bonn, was born on May 12, 19*0, and was general manager of electronics supply firms in Dusseldorf, and the West German capital.

The foreign entities utilized or owned by the Bruchhausen group were as follows:

ADT Analog Und Digital Technik
D-8019 Neiderseeon 21, West Germany
Commenced Business: 1978
General Manager: Werner Bruchhausen
Operation: Import, export, distribute and manufacturer electronic building parts and equipment

Elubat Vertriebsgellschaft Fur Elektronik Und Batterien Mbh
Goethestrasse 11, *000 Dusseldorf, West Germany
Commenced Business: December 30, 1977, under Registry number HRB 595, dated April 7, 1978
Managers: Detlef Lackmann, Werner Bruchhausen

Managers: Detlef Lackmann, Werner Bruchhausen
Ownership: ADT Analog and Digital Technik Bauelemente and Gerate-Vertrieb, Gmbg - 50%, Detlef Lackmann - 50%
Operation: Wholesale of electronical elements, batteries and similar articles

Techma Technische Maschinenhandels - Gesellschaft Mbh Koeingstrasse 10, D-4000 Dusseldorf, West Germany Commenced Business: February 27, 1978, under Registry Number HRB 13228, dated February 27, 1978 General Manager: Hans-Jurgen Koenig Ownership: Hans-Jurgen Koenig - 100% Operation: Distribution, import and export of machine and products of the mechanical engineering, as well as electric devices Elmasch Vertriebsgesellshaft Fur Produkte Der Electrotechnik Und Des Maschinenbaues Mgh Bergstrasse 185, 5300 Bonn 1, West Germany Commenced Business: February 27, 1978, under Registry Number HRB 2478, dated June 19, 1979 General Manager: Hans-Jurgen Koenig Ownership: Hans-Jurgen Koenig - 90%, Stefan Wagner - 10% Operation: Distribution, import and export of electrotechnical and mechanical products Electronic Elektronechnische Bauelmente Handelsgesellshaft 4951 Ameisasse, 1140 Vienna, Austria Commenced Business: October 30, 1974, under Registry Number B-9060, dated November 23, 1964 Managers: Dietmar Ulrichshofer, Helmut Hartner Ownership: Dietmar Ulrichshofer Operation: Distribution of electronic component parts and apparatus as well as other technical articles, mainly in Eastern Europe (80%) Ing. Ulrichshofer, Dietmar Vertrieb Electronischer Bauelmente Und Elektronischer Gerate Baderstrasse 5,823 Bad Reichenhall, West Germany Commenced Business: November 1974 under Registry Number HRA 3530, dated 1976 Sole Proprietor: Dietmar Ulrichshofer Ownership: Dietmar Ulrichshofer Operation: Wholesale in (5%) import of (20%) and export (75%) electronic components, mainly semiconductors. Exports to European countries. Solid State Electronics SA DBA: SSC Solid State Commerz AG, Zurich, Switzerland Commenced Business: April 26, 1971 Director: Dr. Juraj Tamas Zabratzky Operation: Trade in products of the electronic industry and related products, take-over of agencies of all kinds, rendering of commercial services of all kinds, acquisition of participations and real property as well as acquisition, registration and exploitation of patent rights of all kinds. Intra-engineering, GmbH Goethestrasse 11, D-4000 Dusseldorf, West Germany Commenced Business: December 30, 1977, under registry HRB 13197 General Manager: Ing. Gerhard Drost Operation: Development, planning and construction of plants. Universal Transport GmbH Cologne, Dusseldorf and Munich, West Germany

Commenced Business: July 19, 1968, under Registry No. HRB 2296, dated July 27, 1978 Operation: Forwarding and transports of all kinds (air, road and water); especially international forwarding for import and export; customs clearance and air freight. Panalpina AG Zurich, Switzerland Commenced Business: 1920 Operation: Freight forwarder to all parts of the world. Wholesale trade with various butcher articles, such as sausage machines, guts, etc. The firm does mainly transit trade, and there is practically no activity in Switzerland. Copex Air B. V. Subsidiary of shipping and forwarding "SAFF" B. V. Schiphol, Metherlands Commenced Business: January 18, 1977 Managers: G. H. F. Smit, A. M. Hageman Operation: Air freight forwarding.

Microchips: Baubles for modern-day smugglers

By CHARLES J. HANLEY
Associated Press

High tech

First of three parts

FRANKFURT, West Germany — In today's dangerous world of microchip-packed missiles and computerized spy satellites, Werner Bruchhausen is a new kind of global power broker.

Over several years, U.S. authorities say, the friendly young West German importer funneled $10 million worth of illegally exported U.S. high technology to the Soviet bloc — enough, theoretically, to equip an entire plant producing microelectronic brains for new generations of weapons.

Bruchhausen, who faces trade-law charges if he returns to the United States, protested in a telephone interview from his Bavarian villa that "volume-wise, what I've done is Mickey Mouse."

When asked whether that meant others were selling greater amounts of restricted high-tech hardware to the Soviets, Bruchhausen said "Quite definitely."

Bruchhausen is one middleman in what a U.S. Central Intelligence Agency report calls a "massive, well-planned and well-managed" effort by the Soviets to obtain Western high technology for their own arsenals and for military-support industries.

The U.S. government says Moscow uses legal and illegal means, including traditional espionage, systematic review of research literature and participation in Western scientific conferences.

One of the most successful Soviet techniques is reliance on brokers

Microchips: Baubles of a new piracy

• Continued from A1

who make seemingly legitimate purchases of advanced microelectronics.

This twisting high-tech trail leads from the research labs of California's "Silicon Valley," through Frankfurt's bustling jetport, to warehouses in Switzerland or other neutral countries, and on to the design shops of Moscow's defense establishment. For the Bruchhausens along the way, it is a lucrative trade.

"It is the most severe intelligence threat we face today," FBI intelligence chief Edward J. O'Malley said in a Washington interview.

The Reagan administration has mounted a counter-offensive.

It has bolstered enforcement of U.S. export regulations, which require licenses for export of specific high-tech items with possible military use or forbid altogether their export to potential adversaries.

The U.S. administration also has been pressuring European governments and has restrained the free flow of research information that is a hallmark of American science.

But this campaign could flare into a showdown with the American high-tech elite, who complain it stifles scientific creativity and commercial competitiveness, and who say the Soviet economy is unable to absorb the latest technology anyway. At the same time, the U.S. effort is causing friction with West European allies that depend on trade with the Soviets.

The secret commerce includes laser and materials technologies, precision machinery and radar gear. But the key is the microchip, building block of the computer age.

This tiny fleck of silicon, whose maze of electronic circuitry can perform as many as a million calculations a second, not only brings video war games to life, but will drive tomorrow's real wars as well. It has become the essential ingredient in guidance, detection and communication systems.

American defense officials are intent on keeping the latest high-tech items out of Soviet hands. But they say 150 Soviet weapons systems already incorporate elements of Western technology — including missile guidance systems, night-vision devices for ground troops, and sonar buoys for submarines.

"Sometimes we see them fielding equipment before we do, based on our design," Stephen Bryen, a deputy assistant defense secretary, said in Washington. "It takes away the edge we are trying to buy with our defense dollars."

The Soviets once relied on "reverse engineering" — trying to reproduce stolen microchips and other weapons components. But now their target is the sophisticated equipment that actually manufactures the microelectronics.

That kind of critical technology is what Bruchhausen and his U.S. accomplices, Anatoli T. Maluta and Sabina Tittle, were providing.

U.S. authorities say the trio operated in this way, typical of today's covert trade in high tech:

● Using a dozen or so front companies in California and Europe, they bought U.S. items embargoed for export to the Soviet bloc, telling the manufacturers they were for use in the United States.

● They then shipped the equipment to Bruchhausen firms in West Germany, evading U.S. export controls by labeling them "furnaces" or "electric meters."

● Once in Germany, the shipment would be trucked to Switzerland or Austria, and eventually flown out to Moscow or other East-bloc capitals.

Switzerland, Austria and other neutral countries are favored stopovers because they do not adhere to Western alliance restrictions on high-tech exports to the East.

The Bruchhausen network was uncovered in 1981 on the basis of a tip. The shipment of a $145,000 oxidizing machine, essential in the layering process that produces microchips, was intercepted en route in California.

Maluta and Tittle have been imprisoned. Bruchhausen, a West German citizen, is safe in his homeland because violations of foreign export laws are not an extraditable offense here.

He says he no longer deals with the Soviets. Some U.S. investigators are skeptical, but in the meantime they have plenty of other dossiers to follow.

"There is a numberless list of guys doing this sort of thing," said Viktor Jacobson, U.S. Customs attache at the American Embassy in Bonn.

"There's really big money in this. Sometimes their profit is 200 or 300 percent. Their attitude is, 'Business is business.'"

"There may be 15 guys getting an order from the Russians for the same scanner," John Luksic, a Customs investigator, said in Washington. "But the first who can fill the order is the one who can sell it to the Russians or East bloc for top dollar."

Jacobson and Luksic are part of a 18-month-old Customs Service program called Operation Exodus, in which 300 inspectors, investigators and others have mobilized to stop the flow of embargoed high-tech goods to the East. The customs teams are checking suspect shipments at U.S. air and seaports, and following up leads from abroad.

Customs officials said Operation Exodus has led to the seizure of 1,395 high-tech shipments valued at $79.6 million. These included goods headed for the Soviet bloc and other high-tech items being exported without license.

The officials said 229 people were arrested, and 146 convicted.

In addition, dozens of diplomats and other Soviets have been expelled from Western European countries in recent months, some of them alleged agents in search of high technology.

But one U.S. law-enforcement agent acknowledged that, despite the stepped-up surveillance, "we're missing tremendous amounts."

Hi-tech crackdown

Government pursues illegal exporters

Associated Press

WASHINGTON — The Commerce Department and Customs Service say they have about 50 court cases pending in their stepped-up campaign to stop the illegal export of U.S. technology, particularly to the Soviet Union.

Here are summaries of six cases over the past two years:

● A Swiss man was arrested at Los Angeles International Airport as he was about to board a flight to Zurich with two suitcases containing unlicensed test equipment for satellite and missile guidance systems. The equipment had been bought from an aircraft manufacturer by an international trading firm.

● Two Americans and a Canadian were arrested in the Washington area as they tried to ship a $5-million diesel engine assembly line to the Soviet Union for use at a truck plant. The government had banned shipment of the machinery. The men, who later pleaded guilty to export-law violations, had prepared false documents saying the assembly line was destined for France.

● Federal agents seized a "photoreading" system, used in manufacturing microelectronic equipment, as it was being shipped without license from New York's John F. Kennedy International Airport. The system, headed for a firm in Italy, is highly sought by the Soviet Union, U.S. officials said.

● West German customs agents, tipped by U.S. authorities, seized U.S.-made computer equipment worth $400,000 after it arrived in West Germany and was being diverted to Switzerland. U.S. Customs officials said the computers, bought in the United States by a Canadian firm and first shipped by way of Canada, were bound for the Soviet Union.

● Two Cuban diplomats at the United Nations were ordered expelled from the United States after Customs agents intercepted parts of a television-satellite monitoring system they had bought from a Florida firm and were trying to get out of the country.

● A West German was arrested by federal agents in New York before he could board a flight to West Germany with a suitcase-size microwave surveillance receiver system, used by the military and police to listen in on a broad range of microwave frequencies. The system reportedly was bound for Hungary.

High technology reaches Soviets via underground

By CHARLES J. HANLEY

FRANKFURT, West Germany (AP) – In today's dangerous world of microchip-packed missiles and computerized spy satellites, Werner Bruchhausen is a new kind of global power broker.

Over several years, U.S. authorities say, the friendly young West German importer funneled $10 million worth of illegally exported U.S. high technology to the Soviet bloc – enough, theoretically, to equip an entire plant producing microelectronic brains for new generations of weapons.

Bruchhausen, who faces trade-law charges if he returns to the United States, protested in a telephone interview from his Bavarian villa that "volume-wise, what I've done is Mickey Mouse."

Does that mean others are selling even greater amounts of restricted high-tech hardware to the Soviets?

"Quite definitely," he said.

Bruchhausen is one middleman in what a U.S. Central Intelligence Agency reprt calls a "massive, well-planned and well-managed" effort by the Soviets to obtain Western high technology for their own arsenals and for military-support industries.

The U.S. government says Moscow uses legal and illegal means, including traditional espionage, systematic review of research literature and participation in Western scientific conferences.

One of the Soviets' most successful techniques: reliance on brokers who make seemingly legitimate purchases of advanced microelectronics.

A lucrative trade

This twisting high-tech trail leads from the research labs of California's "Silicon Valley," through Frankfurt's bustling jetport, to warehouses in Switzerland or other neutral countries, and on to the design shops of Moscow's defense establishment. For the Bruchhausens along the way, it is a lucrative trade.

"It is the most severe intelligence threat we face today," the FBI's intelligence chief, Edward J. O'Malley, said in a Washington interview.

The Reagan administration has mounted a counter-offensive.

It has bolstered enforcement of U.S. export regulations, which require licenses for export of specific high-tech items with possible military use or forbid their export altogether to potential adversaries.

The U.S. administration also has been pressuring European governments and has restrained the free flow of research information that is a hallmark of American science.

But this campaign could flare into a showdown with the American high-tech elite, who complain it stifles scientific creativity and commercial competitiveness, and who say the Soviet economy is unable to absorb the latest technology anyway. At the same time, the U.S. effort is causing friction with West European allies that depend on trade with the Soviets.

The secret commerce includes laser and materials technologies, precision machinery and radar gear. But the key is the microchip, building block of the computer age.

This tiny fleck of silicon, whose maze of electronic circuitry can perform as many as a million calculations a second, not only brings video war games to life, but will drive tomorrow's real wars as well. It has become the essential ingredient in guidance, detection and communication systems.

American defense officials are intent on keeping the latest high-tech items out of Soviet hands. But they say 150 Soviet weapons systems already incorporate elements of Western technology – including missile guidance systems, ground troops' night-vision devices, and submarines' sonar buoys.

'Reverse engineering'

"Sometimes we see them fielding equipment before we do, based on our design," Stephen Bryen, a deputy assistant defense secretary, said in Washington. "It takes away the edge we are trying to buy with our defense dollars."

The Soviets once relied on "reverse engineering" – trying to reproduce stolen microchips and other weapons components. But now their target is the sophisticated equipment that actually manufactures the microelectronics.

That kind of critical technology is what Bruchhausen and his U.S. accomplices, Anatoli T. Maluta and Sabina Tittle, were providing.

U.S. authorities say the trio operated in this way, typical of today's covert trade in high tech:

Using a dozen or so front companies in California and Europe, they bought U.S. items embargoed for export to the Soviet bloc, telling the manufacturers they were for use in the United States.

They then shipped the equipment to Bruchhausen firms in West Germany, evading U.S. export controls by labeling them "furnaces" or "electric meters." Once in Germany, the shipment would be trucked to Switzerland or Austria, and eventually flown out to Moscow or other East-bloc capitals.

Switzerland, Austria and other neutral countries are favored stopovers because they do not adhere to Western alliance restrictions on high-tech exports to the East.

The Bruchhausen network was uncovered in 1981 on the basis of a tip. The shipment of a $145,000 oxidizing machine, essential in the layering process that produces microchips, was intercepted en route in California.

Maluta and Miss Tittle have been imprisoned. Bruchhausen, a West German citizen, is safe in his homeland because violations of foreign export laws are not an extraditable offense here.

He says he no longer deals with the Soviets. Some U.S. investigators are skeptical, but they have plenty of other dossiers to work on.

'Really big money'

"There is a numberless list of guys doing this sort of thing," said Viktor Jacobson, U.S. Customs attache at the American Embassy in Bonn.

"There's really big money in this. Sometimes their profit is 200 or 300 percent. Their attitude is, 'Business is business.'"

"There may be 15 guys getting an order from the Russians for the same scanner," John Luksic, a Customs investigator, said in Washington. "But the first who can fill the order is the one who can sell it to the Russians or East bloc for top dollar."

Jacobson and Luksic are part of a 1½-year-old Customs Service program called Operation Exodus, in which 300 inspectors, investigators and others have been mobilized to stop the flow of embargoed high-tech goods to the East. The Customs teams are checking suspect shipments at U.S. air and seaports, and following up leads from abroad.

In its first 18 months, Customs officials said, Operation Exodus led to the seizure of 1,395 high-tech shipments valued at $79.6 million. These included not just goods known to be headed for the Soviet bloc, but also other high-tech items being exported without license.

The officials said 229 people were arrested, and 146 people convicted.

In addition, dozens of diplomats and other Soviets have been expelled from Western European countries in recent months, some of them alleged agents in search of high technology.

"We know we've slowed it down," Bryen said. "There have been a lot of seizures, some of it apparently stuff the Soviets need very badly – scanning equipment for aircraft and spacecraft, elaborate computer devices."

But one U.S. law-enforcement agent acknowledged that, despite the stepped-up surveillance, "we're missing tremendous amounts."

One reason these guardians of America's technological genius are nervous: The U.S. microelectronics industry may soon produce "supercomputers" that could catapult the U.S. military into a vast lead in electronic warfare – if they are not stolen first.

High-tech trail

The twisting high-tech trail leads from the research labs of California's "Silicon Valley," through Frankfurt's bustling jetport, to warehouses in Switzerland or other neutral countries, and on to the design shops of Moscow's defense establishment. It is a lucrative trade.

50 court cases pending

WASHINGTON (AP) – The Commerce Department and Customs Service say they have about 50 court cases pending in their stepped-up campaign to stop the illegal export of U.S. technology, particularly to the Soviet Union.

Here are summaries of six cases over the past two years:

– A Swiss was arrested at Los Angeles International Aiport as he was about to board a flight to Zurich with two suitcases containing unlicensed test equipment for satellite and missile guidance systems. The equipment had been bought from an aircraft manufacturer by an international trading firm.

– Two Americans and a Canadian were arrested in the Washington area as they tried to ship a $5-million diesel engine assembly line to the Soviet Union for use at a truck plant. The government had banned shipment of the machinery. The men, who later pleaded guilty to export-law violations, had prepared false documents saying the assembly line was destined for France.

– Federal agents seized a "photoreading" system, used in manufacturing microelectronic equipment, as it was being shipped without license from New York's John F. Kennedy International Airport. The system, headed for a firm in Italy, is highly sought by the Soviet Union, U.S. officials said.

– West German customs agents, tipped by U.S. authorities, seized $400,000 worth of U.S.-made computer equipment after it arrived in West Germany and was being diverted to Switzerland. U.S. Customs officials said the computers, bought in the United States by a Canadian firm and first shipped via Canada, were bound for the Soviet Union.

– Two Cuban diplomats at the United Nations were ordered expelled from the United States after Customs agents intercepted parts of a television-satellite monitoring system they had bought from a Florida firm and were trying to get out of the country.

– A West German was arrested by federal agents in New York before he could board a flight to West Germany with a suitcase-size microwave surveillance receiver system, used by the military and police to listen in on a broad range of microwave frequencies. The system reportedly was bound for Hungary.

How Technology Is Smuggled Overseas

By Warren Richey
© Christian Science Monitor

TECHNOBANDITS. **By Linda Melvern, David Hebditch, and Nick Anning. Houghton Mifflin. 305 pages. $15.95.**

Technobandits may soon be regarded as required reading in the American high-technology industry.

It is the first book to examine the controversial issue of the smuggling of United States high technology to the Soviet Union. The book, which documents several of the most notorious cases of illegal high-tech diversion, is written in the style of a combination spy-thriller and journalistic expose.

The book's strength is that it endeavors to put real faces on many of the shadowy figures who, for the past several years, have made lucrative livings by buying and selling goods that have been controlled to protect U.S. national security.

Technobandits concentrates on exposing — as the book cover puts it — "How the Soviets are stealing America's high-tech future." It details law enforcement successes and bureaucratic bumbling, as well as the heated intra-Washington feud between the Commerce Department and the Customs Service over who should be top dog in policing high-tech diversion. The book also examines the strain this issue has placed on the Western alliance.

Technobandits

Readers expecting solutions may be disappointed. The book touches on the larger, more difficult questions but tends to concentrate at length on the spy-like stories of technology smuggling. It does not provide an in-depth examination of how U.S. export controls can be made more effective.

Nonetheless, it is an interesting and useful book — especially given the Commerce Department's recent announcement that large volume high-tech exporters will be required to keep a sharp eye out for potential technology smugglers.

The new regulations of the department — to take effect Jan. 15 — make it the responsibility of American high-technology firms and their employees to ensure that the company's products will not be illegally diverted to the Soviets. (In the past, enforcement responsibility fell entirely on government investigative agencies.)

Thus, a section of industrial America will soon gear up to head off such known diverters as Richard Mueller, Werner Bruchhausen, and Fredrich Linnhoff. In addition, America will probably be facing a new generation of even more sophisticated technobandits, say the authors.

"Technobandits know how to get around the rules that are in place now," says Melvern, an investigative reporter who has worked for the London *Sunday Times*.

The book devotes an entire chapter to Richard Mueller, perhaps the best-known and most sought technobandit. He is currently a fugitive. The authors call him a "superbandit." Mueller, operating since 1974, is said by U.S. officials to have set up some 41 dummy firms in Europe and Africa solely for the purpose of facilitating the diversion of sensitive American high tech.

He is the technobandit said to be behind the now-famous attempted VAX computer diversion last year from South Africa to the Soviet Union via West Germany and Sweden. The diversion trail, as outlined by the authors, demonstrates the lengths to which determined smugglers may go to attempt to avoid detection.

According to the authors, the sensitive computers were transferred from one of Mueller's South African firms, Microelectronics Research Institute (MRI) to another of his South African firms, Optronix. The computers were then resold to a Swiss firm, Integrated Time AG. The Swiss firm was a subsidiary of Mueller's German firm, Deutsche Integrated Time. In the meantime, the computers had been loaded on a ship bound for Sweden and the Soviet Union.

The authors also provide added details of another case involving shipments of VAX computer systems to the East bloc via Mueller front organizations.

This fall Digital Equipment Corporation paid a $1 million fine as a result of a sale of VAX computers in 1982 from a Norwegian firm to Mueller's West German firm, Deutsche Integrated Time. At the time company officials did not realize the firm was a Mueller front.

But, according to the authors, the story didn't stop there. He still had to find a way to get the computers to the East bloc.

Earlier that year, the authors write, Mueller took over a failing organ company in West Germany and used its loading dock to recrate and disguise the same VAX computers purchased by Deutsche Integrated Time. The contents of the boxes were listed on shipping documents as airconditioners, office furniture, light fixtures, and PVC foam filling.

Then on Oct. 29, 1982, according to the authors, a truck with Hungarian license plates carried the disguised computers across the East German border.

1985 (May 12) ARREST - IN KENSINGTON DISTRICT, LONDON

Full page : [HN00LX][GDrive]

'Techno bandit' arrested by Scotland Yard

LONDON (AP) — A West German was ordered held without bail Friday to face an American extradition demand on charges of exporting U.S. high technology to the Soviet Union and Eastern Europe.

Scotland Yard spokesman Mick Jordan said Werner J. Bruchhausen was arrested Wednesday at a hotel in London's fashionable Kensington district by the police extradition squad.

U.S. officials hailed the arrest as a major break in a drive to stop unauthorized exports to the East bloc.

In Washington, William von Raab, U.S. customs commissioner, described Bruchhausen as "one of the world's top techno-bandits."

Bruchhausen appeared at Bow Street Magistrates Court in central London today and Magistrate William Robins ordered that he be held in custody. A further hearing was scheduled for May 17.

The U.S. Embassy in London said that under the terms of the U.S.-Britain extradition treaty, Washington has until June 23 to provide Britain with documents to support its demand for Bruchhausen's extradition.

Trail of high-tech smugglers

By PAUL LASHMAR

DETAILS of an alleged multi-million dollar operation to smuggle western technology behind the Iron Curtain were revealed last week in a London court when the United States Government moved to extradite the alleged 'Mr Big' of the smuggling ring.

Werner Bruchhausen, 46, a West German businessman was arrested by Scotland Yard detectives at London's Kensington Hilton in May for alleged arms control breaches. According to the Americans, Bruchhausen has been selling embargoed high technology to the Soviet Bloc since 1976. They say he has been involved in arranging the smuggling of at least 400 items of equipment worth up to $24 million from California's 'silicon valley.' These include a surveillance system for missile tracking, a complete chip manufacturing plant and an innovative chip testing system.

Bruchhausen, who denies the allegations, is being held in custody in Pentonville prison pending the outcome of the extradition hearing which resumes later this month.

Bow Street magistrates court was told last week that when Bruchhausen was arrested he told police his name was 'Werner Haus' and was carrying a Brazilian passport in that name. His identity was revealed when his fingerprints were checked with West German police.

Werner Bruchhausen : extradition move

Related inquiries led to the arrest of a Durham businessman, Clifford Chadwick, 48, by Customs officers from Operation Arrow, a team especially set up by the British Government to deal with high technology smuggling. Two weeks ago Chadwick was sentenced to nine months in jail for sending two advanced VAX computers to Bulgaria.

Bruchhausen has been wanted by the US Customs since 1980. Following a tip-off from former employees, customs officers investigated one of his operations, California Trading Corporation, run by Antoli Baluti, a former US Air Force officer born in the Ukraine in 1920.

The US authorities issued a 60-count indictment against Bruchhausen, Maluti and the latter's German lover, Sabrina Dorn Tittel, for sending embargoed technology to the Soviets.

Bruchhausen was out of the country at the time and remains wanted by the US Customs. Following a trial in California at the end of 1981 Maluti was jailed for five years and fined $50,000. Tittel was jailed for two years and fined $25,000.

When Bruchhausen was arrested in London, the original 60-count indictment had been reduced to three. None of these charges was apparently extradictable, yet he remained in custody for a month while a grand jury was reconvened in California and a further four indictments were brought.

Bruchhausen denies the American charge that he is a fugitive from justice and says he has merely not been to the US recently. He also claims the charges are of a political character and therefore not extradictable.

In a BBC 'Panorama' interview in July 1983 Bruchhausen said it was not against the law to ship material from the US to Germany, from Germany to Switzerland, or from Switzerland to the Soviet Union.

West German 'Techno Bandit' Did 'Tremendous Harm,' Prosecutor Says

By JOHN KENDALL, *Times Staff Writer*

A West German businessman described as one the world's top "techno bandits" did "tremendous harm" to U.S. security by illegally diverting millions of dollars worth of American high technology to the Soviet Union, a federal prosecutor declared Tuesday.

Assistant U.S. Atty. William F. Fahey charged in Los Angeles federal court that Werner Bruchhausen, 47, had provided "tremendous benefits" to the Soviets by selling them more than $6 million worth of high technology and military equipment.

Bruchhausen, an electronics engineer who conducted his worldwide operation from a mansion outside Munich before his arrest in Britain in May, 1985, is on trial on 15 counts of mail fraud. He was extradited to the United States in June.

Fahey declared in an opening statement that the Soviets recruited Bruchhausen in the early 1970s to obtain U.S. technology that could not be shipped outside this country without export licenses issued by federal authorities.

The Soviets were so eager to obtain American-made electronic and computer equipment for military and civilian use that they were willing to pay Bruchhausen up to 10 times the value of the gear, Fahey said.

Just how well the Soviet Union succeeded in its buying efforts will be explored by expert government witnesses during the trial, according to Fahey. But he offered examples outside of court on Tuesday.

The Soviets acquired an entire plant enabling them to greatly improve their quality control in computer microchip production, increasing the number of good chips from 10% to 70% or 80%, Fahey said. Also, he said, they acquired U.S. military communications equipment that permitted them to monitor North Atlantic Treaty Organization forces.

Bruchhausen's attorney, Alan M. May, portrayed his client as an ambitious businessman who set out to make his fortune during a period of detente between the United States and the Soviet Union and ended up being a victim who was betrayed by lying associates and set up by federal officials.

Bruchhausen never talked to any U.S. manufacturers about sensitive equipment and never falsely filled out a government form, May said. "And now they say, 'Werner made me do it.' "

Quite a different opinion of Bruchhausen's role in securing U.S. technology was expressed when the British agreed to extradite him.

"We have spread our net wide and caught one of the biggest fish," said Customs Commissioner William Von Raab. "Werner Bruchhausen is one of the most important members of a small fraternity of shady characters who handle most of the transfers of forbidden technology to the Soviet Bloc."

Fahey alleged that Bruchhausen designed an elaborate scheme to smuggle American high-tech gear by setting up dozens of companies, several of them in California, and instructing his agents on how to export components without detection either by U.S. manufacturers and federal authorities.

The prosecutor charged that two of Bruchhausen's companies operated under different identities out of the same office, one to buy equipment and the other to illegally ship it out of the country by falsely declaring what was being shipped and concealing its value and final destination.

Fahey accused Bruchhausen of setting up two companies in Marina del Rey in October, 1974, to purchase and export technical commodities. He said the names of the firms were changed twice within six years before authorities became suspicious.

According to Fahey, Bruchhausen and his agents made at least 13 attempts to export high-tech equipment between 1978 and 1980, starting with his first successful attempt in November, 1978, when Bruchhausen purportedly acquired a Data General S/230 computer.

Sometimes equipment was sent to Switzerland, or West Germany, or Austria, Fahey said. But, he said, "Eventually all of it ended up in the Soviet Union."

Bruchhausen was originally named, along with two Southern California residents, in a 60-count indictment returned by a federal grand jury in Los Angeles in August, 1981.

The others, Russian-born Antoli (Tony) Maluta and Sabina Dorn Tittel, were sentenced to prison in 1981 for illegally diverting U.S. technology. Bruchhausen avoided arrest for four year.

Bruchhausen's lawyer described Maluta on Tuesday as a snake who, as Bruchhausen's agent, had lied to equipment manufacturers and U.S. Customs officials, and stolen $750,000 from the defendant.

The trial, which U.S. District Judge Alicemarie Stotler is hearing without a jury, is expected to last three or four weeks.

A West German imprisoned for selling classified technology to the Soviet Union and Eastern European countries tried to escape the Federal prison here in a helicopter Saturday, officials said today.

Federal officers were there to halt the escape of the prisoner, Werner Bruchhausen, before he could board the helicopter at the Federal Correctional Institution, a prison spokesman said.

Mr. Bruchhausen, 48 years old, began serving a 15-year prison sentence for wire fraud in May 1987.

A crew from a Tallahassee television station, WCTV, which had been notified that an escape was planned, waited outside the prison and videotaped the helicopter descend into the compound Mr. Bruchhausen was in the recreation yardat the time, said Lieut. Roy Gay, operations supervisor at the prison.

The authorities released few details about the escape attempt. WCTV said it had been told that Mr. Bruchhausen had offered to pay more than $100,000 to get out of prison.

Mr. Bruchhausen, was transferred to an undisclosed, more secure prison, Lieutenant Gay said.

Mr. Bruchhausen had fled the United States after a Federal grand jury in Los Angeles accused him and three others in August 1981 of conspiracy and violating the Export Administration Act, the Arms Export and Control Act and Federal income tax law. Mr. Bruchhausen was arrested in London on May 8, 1985, on immigration violations.

Techno-bandit's helicopter escape plan foiled

1988-08-30-european-stars-and-stripes-germany-pg-5-clip-bruchhausen

AP

Photos taken from television screen show helicopter taking off from prison yard and Werner Bruchhausen being taken away in handcuffs after unsuccessful escape attempt.

TALLAHASSEE, Fla. (AP) — Officers from four federal agencies foiled an attempt by a West German once described as "one of the world's top techno-bandits" to escape from a federal prison here in a helicopter, officials said Sunday.

Officials had been tipped of Werner Bruchhausen's escape plans and were on hand to prevent him from boarding the helicopter at the Federal Correctional Institution Saturday, prison spokesman Dan Rouse said.

A crew from Tallahassee television station WCTV, which had been tipped that an escape was planned, were outside the prison and videotaped the unmarked helicopter as it swooped down into the compound and lifted off a few seconds later.

"At the time he attempted to escape he was in the recreation yard along with scores of others," said Lt. Roy Gay, operations supervisor at the medium-minimum security prison. About six guards were watching the inmates.

Bruchhausen, imprisoned for selling classified technology to the Soviet Union and Eastern European countries, was transferred to a more secure prison, Gay said. He refused to disclose the location.

Unidentified sources told WCTV that Bruchhausen had offered to pay more than $100,000 to get out of prison.

"We're aware of a lot of details we still can't go with. If we let on to everything we know, we'll jeopardize the case," WCTV news director Jim Foy said Sunday night.

Asked about the tip, Foy said: "We were just alerted to this possibility. We had no idea whether it was a crank call. We went not knowing what was up, and lo and behold, a helicopter came out of the sky. It was Christmas in August."

Federal authorities are considering filing escape charges, said R.E. Honsted, warden of the prison, which holds about 1,000 inmates.

Bruchhausen, 48, began serving a 15-year prison term for wire fraud in May 1987.

He had fled the United States after a federal grand jury in Los Angeles accused him and three others in August 1981 of conspiracy and violating the Export Administration Act, the Arms Export and Control Act and federal income tax laws.

The 60-count indictment charged that from January 1977 through June 5, 1980, Bruchhausen and the others "conspired to export from the United States various high technology commodities" to East Germany and elsewhere without obtaining export licenses from the State and Commerce departments.

On May 8, 1985, London police arrested Bruchhausen on immigration violations and U.S. officials immediately began extradition proceedings.

Bruchhausen smuggled a microwave receiver system, semiconductor manufacturing equipment, a computer system and other military and scientific items to the Soviet bloc through dummy corporations in California and West Germany, U.S. Customs Commissioner William von Rabb said.

He called Bruchhausen "one of the world's top techno-bandits" and said his arrest was "a major break in this country's efforts to track and arrest people wanted for deceiving and defrauding American businesses by selling potential high technology to the Soviets."

Helicopter 'escape attempt' revealed as a trick

1988-08-31-european-stars-and-stripes-germany-pg-7-clip-bruchhausen

TALLAHASSEE, Fla. (UPI) — Federal officials used a disguised helicopter and a U.S. Customs pilot to trick imprisoned "techno-bandit" Werner Bruchhausen into trying to escape, then foiled the attempt, authorities revealed Monday.

Bruchhausen, 45, of West Germany, who is serving a 15-year sentence for selling high-tech secrets to the Soviet Union and other communist countries. He is considered to be one of the leading "techno-bandits" in U.S. history, and until Sunday was confined at Tallahassee's low-security Federal Correctional Institute.

About 7:30 p.m. Sunday, a black helicopter swooped over the prison wall and appeared to make a landing on an exercise field. Bruchhausen ran toward the helicopter, only to see it rise and take off as he approached.

"It was a government helicopter flown by a U.S. Customs Service agent," said Warden Robert Honsted, describing the scam. "That's what enabled us to apprehend Mr. Bruchhausen, obviously, and preclude him from boarding the craft and fleeing."

Bruchhausen has since been moved to the high-security Atlanta Federal Penitentiary and may be charged with attempted escape and conspiracy to escape. He could be sentenced to 10 more years in prison and fined up to on those charges.

Honsted said officials were tipped by unnamed sources 2½ weeks ago that Bruchhausen was planning an escape. Prison officials began monitoring Bruchhausen's outgoing telephone calls.

From those calls, they pieced together Bruchhausen's escape plans, which included a proposed $250,000 payoff to his rescuers.

Honsted and other officials said an investigation into the escape "conspiracy" is continuing and refused to give other details.

Honsted said a $5,000 down payment was in the custody of law enforcement officials, but refused to say if that payment had been delievered to one of the suspected co-conspirators.

U.S. Attorney Michael Moore said an indictment has been issued against a person who is not in custody. He refused to elaborate on that person's identity.

The escape attempt was videotaped by WCTV, a CBS affiliate that had been tipped to the story in advance. Moore said he would like to know where the station got its information, but that he did not plan to take any action against it.

Moore said WCTV knew authorities were already aware of the planned escape and so did not call prison officials. He said the escape was filmed from a nearby road and not from the prison grounds.

WCTV managing editor Richard Smith declined comment.

A government helicopter, disguised to look like one that inmate Werner Bruchhausen allegedly hired to help him escape, lifts off over the Federal Correctional Institute in Tallahassee, Fla. The scene was filmed by a TV station.

Officials learn escape plot, concoct another one to catch 'technobandit'

United Press International

TALLAHASSEE, Fla. — Federal officials used a disguised helicopter and a U.S. Customs pilot to trick imprisoned "technobandit" Werner Bruchhausen into trying to escape, then foiled the attempt, authorities said Monday.

Bruchhausen, 45, is serving a 15-year sentence for selling high-tech secrets to the Soviet Union and other Eastern bloc countries. He is considered to be one of the leading "technobandits" in U.S. history, and until Sunday had been confined at Tallahassee's low-security Federal Correctional Institute.

At about 7:30 p.m. Sunday, a black Vietnam-era helicopter swooped over the prison wall and appeared to make a landing on an exercise field. Bruchhausen ran toward the helicopter, only to see it rise and take off as he approached.

"It was a government helicopter, it was flown by a U.S. Customs Service agent," said Warden Robert Honsted. "That's what enabled us to apprehend Mr. Bruchhausen, obviously, and preclude him from boarding the craft and fleeing."

Bruchhausen since has been moved to the high-security Atlanta Federal Penitentiary and may be charged with attempted escape and conspiracy to escape. He could be sentenced to 10 more years in prison and fined up to $15,000 on those charges.

Honsted said officials were tipped by unidentified sources 2½ weeks ago that Bruchhausen was planning an escape attempt and began monitoring his outgoing telephone calls.

From those calls, they pieced together Bruchhausen's escape plans, which included a $250,000 payoff to his rescuers.

Honsted and other officials said an investigation into the "conspiracy" is continuing and refused to give out many details. Honsted said a $5,000 down payment was in the custody of law-enforcement officials but refused to say whether that payment had been delivered to one of the suspected co-conspirators.

U.S. Attorney Michael Moore said an indictment has been issued against a person who is not in custody. He refused to elaborate on that person's identity.

The escape attempt was videotaped by WCTV, a CBS affiliate that had been tipped to the story in advance. Moore said that he would like to know where the station got its information but that he did not plan to take any action against the station.

Moore said WCTV knew authorities were already aware of the planned escape and so did not call prison officials. He said the escape was filmed from a nearby road, off the prison grounds. WCTV Managing Editor Richard Smith declined comment.

Grand jury indicts pair in foiled escape attempt

Democrat staff report

A Tallahassee federal grand jury returned indictments Friday against Werner Bruchhausen and Margaret Winget, on charges stemming from a daring, but foiled, attempt to escape from the Federal Correctional Institution by helicopter.

Bruchhausen, a 48-year-old West German citizen considered by the U.S. Customs Service to be "one of the world's top techno-bandits" for selling millions of dollars worth of high-tech equipment to Soviet-bloc countries, was serving a 15-year sentence at the Tallahassee prison for wire fraud.

Winget, described as Bruchhausen's friend who lives in Los Angeles, is accused of helping the inmate relay telephone messages to his sister in West Germany.

According to Gail London, spokeswoman for the U.S. Attorney's Office, both Bruchhausen and Winget were indicted for conspiracy to escape, carrying a maximum penalty of five years in prison and a $10,000 fine. In addition, Bruchhausen is charged with attempted escape, and Winget is charged with assisting in the escape attempt. Those charges each carry a maximum penalty of five years in prison and a $5,000 fine.

On Aug. 27, Bruchhausen made his way to a helicopter that swooped low near Tom Brown Park, aiming for the prison softball field. According to federal agents, he got within 20 feet of the helicopter, which never landed. It was piloted by a U.S. Customs agent, authorities said, on a successful mission to trap Bruchhausen in his own escape plan.

Now, Bruchhausen is in an high-security federal prison in Atlanta.

Winget is free on $50,000 bail in Los Angeles, London said.

A hearing will be held Tuesday in Los Angeles to verify Winget's identity, London said.

No trial date has been set.

German conspired to escape

TALLAHASSEE — A West German considered by U.S. officials to be "the world's top techno-bandit," was convicted Friday in federal court on two counts of conspiracy to escape.

A jury found Werner Bruchhausen guilty of trying to escape from the Federal Correctional Institution last August.

Authorities foiled Bruchhausen's daring attempt by setting up a U.S. Customs helicopter as the escape aircraft. Bruchhausen, 48, reportedly offered to pay up to $250,000 for assistance.

Spy's escape attempt extends his prison time

1989-04-28-tallahassee-democrat-pg-33-clip-bruchhausen

By Albert Oetgen
Democrat staff writer

A federal judge sentenced a West German industrial spy on Thursday to another 30 months in prison for trying to break out of Tallahassee's federal prison, and delivered an impassioned defense of American justice in the process.

A jury convicted Werner Bruchhausen on Feb. 25 of conspiracy and attempted escape for plotting to fly out of the prison in a helicopter on Aug. 27.

He was already serving a 15-year sentence for selling high-tech secrets to the Soviet Union and other Eastern Bloc countries when he tried to escape. He has 13 years left on his original sentence.

The defendant's friends and family wrote U.S. District Court Judge William Stafford, urging leniency and criticizing the original sentence as too harsh.

Stafford was not happy with the tone of the criticism, nor with Bruchhausen's attempt to discredit his original conviction during his trial on the escape and conspiracy charges.

"No one should be critical of our system because they may be grieved by a particular decision," Stafford said, emphasizing that the two proceedings were entirely separate.

He offered a broad defense of the American judicial system and his view of the American way of life.

He suggested that it was "the European experience of those who drafted our Constitution" that led to the creation of an independent judiciary. He said that Bruchhausen and his friends should understand that "the court system in this government is not an agency of government. It indeed is a co-equal branch of government."

His remarks were not intended as a lecture or an admonition to Bruchhausen, Stafford said, "but just to share with you my thoughts about this great country."

"I don't see anyone trying to sail into Cuba (or) emigrate to the Soviet Union," Stafford said. "I don't know of anyone who's tried to go east over the Berlin Wall."

Stafford also levied a $40,000 fine, which he ordered Bruchhau-

Please see ESCAPE, 2C

Escape

From 1C

sen to begin paying upon his release from prison.

Prosecutors had asked the judge to go outside of prescribed guidelines and sentence Bruchhausen to 10 years in prison for the conspiracy and escape convictions.

But Stafford said the sentencing guidelines were adequate and fair, and used his ruling as another opportunity to lecture the defendant.

"That's the kind of legal system we have in a country in which the people have the maximum amount of freedom possible, short of anarchy," Stafford said.

The government said Bruchhausen had approached another inmate on work release and offered to pay $250,000 to escape and fly back with a helicopter to free Bruchhausen.

The inmate instead told authorities. They faked the escape of that inmate, then staged an escape attempt, using a U.S. Customs helicopter. It took off and Bruchhausen was arrested.

A pre-sentencing report included information from Scotland Yard that Bruchhausen once tried to escape from a London prison, and from federal penal officials that Bruchhausen had attempted an escape from federal prison in California.

He currently is being held in federal prison in Atlanta.

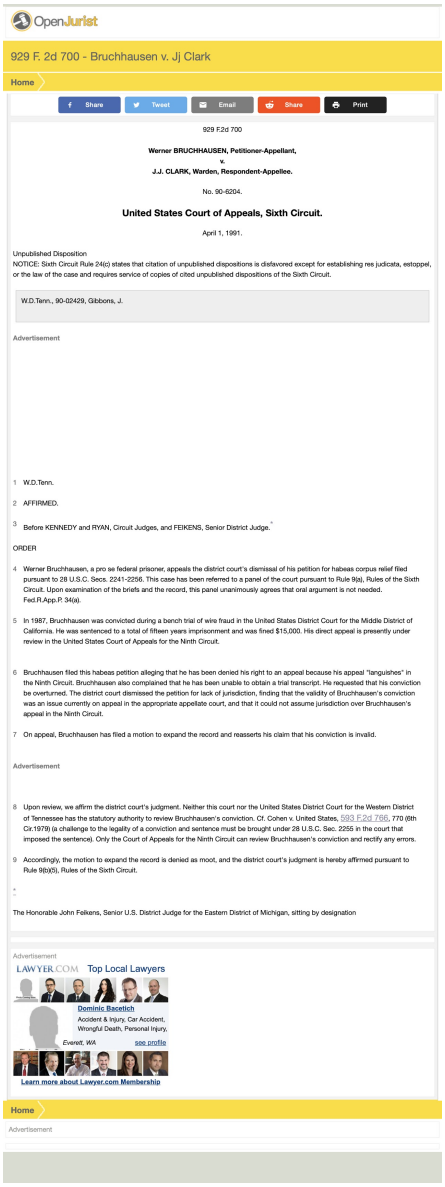
1991 - Appeal

Source = [HG002Q][GDrive]



[HG002R][GDrive]

W.D.Tenn.

1. AFFIRMED.
2. Before KENNEDY and RYAN, Circuit Judges, and FEIKENS, Senior District Judge.*
3. ORDER
4. Werner Bruchhausen, a pro se federal prisoner, appeals the district court's dismissal of his petition for habeas corpus relief filed pursuant to 28 U.S.C. Secs. 2241-2256. This case has been referred to a panel of the court pursuant to Rule 9(a), Rules of the Sixth Circuit. Upon examination of the briefs and the record, this panel unanimously agrees that oral argument is not needed. Fed.R.App.P. 34(a).
5. In 1987, Bruchhausen was convicted during a bench trial of wire fraud in the United States District Court for the Middle District of California. He was sentenced to a total of fifteen years imprisonment and was fined $15,000. His direct appeal is presently under review in the United States Court of Appeals for the Ninth Circuit.
6. Bruchhausen filed this habeas petition alleging that he has been denied his right to an appeal because his appeal "languishes" in the Ninth Circuit. Bruchhausen also complained that he has been unable to obtain a trial transcript. He requested that his conviction be overturned. The district court dismissed the petition for lack of jurisdiction, finding that the validity of Bruchhausen's conviction was an issue currently on appeal in the appropriate appellate court, and that it could not assume jurisdiction over Bruchhausen's appeal in the Ninth Circuit.
7. On appeal, Bruchhausen has filed a motion to expand the record and reasserts his claim that his conviction is invalid.
8. Upon review, we affirm the district court's judgment. Neither this court nor the United States District Court for the Western District of Tennessee has the statutory authority to review Bruchhausen's conviction. Cf. Cohen v. United States, 593 F.2d 766, 770 (6th Cir.1979) (a challenge to the legality of a conviction and sentence must be brought under 28 U.S.C. Sec. 2255 in the court that imposed the sentence). Only the Court of Appeals for the Ninth Circuit can review Bruchhausen's conviction and rectify any errors.
9. Accordingly, the motion to expand the record is denied as moot, and the district court's judgment is hereby affirmed pursuant to Rule 9(b)(5), Rules of the Sixth Circuit*

The Honorable John Feikens, Senior U.S. District Judge for the Eastern District of Michigan, sitting by designation

1992 (Oct) - Conviction overturned by 9th circuit !?!?

ATTORNEYS - William F. Fahey, Assistant U.S. Attorney ., Los Angeles , Cal., for plaintiff-appellee.

~ JUDGES William Cameron Canby , Alex Kozinski , Ferdinand Francis Fernandez

CANBY, Circuit Judge:

Werner J. Bruchhausen appeals his conviction for wire fraud in violation of 18 U.S.C. § 1343 and 18 U.S.C. § 2(b).

We reverse.

BACKGROUND

This case arises out of a scheme to smuggle American technology to Soviet Bloc countries. Bruchhausen, a German citizen, engineered the effort by deceiving the United States government and manufacturers. The deception spanned more than ten years and led to the diversion of millions of dollars in equipment.

Bruchhausen often relied on his American agents to deal directly with the manufacturers. With Bruchhausen's blessing, these agents assured company representatives that all equipment would be used in the United States. No manufacturer was told that the equipment actually was going to West Germany and then on to the Soviet Bloc. Representatives from these companies testified that they would never have sold to Bruchhausen had they known the truth .

The deception also took other forms. Bruchhausen's agents prepared two sets of invoices: one stating the shipment's true value, and a second reflecting only ten percent of this amount. The first invoice was sent to Bruchhausen in Germany. Meanwhile , the second invoice would accompany the delivery to freight forwarders and to United States Customs. Bruchhausen believed that this method would reduce the likelihood that officials would search the crates.

In addition, agents mischaracterized the shipments when preparing Shipper's Export Declarations. For example, they would label shipments of computers and military communications equipment as "electrical" or "meters." Further, Bruchhausen instructed them not to apply for export licenses in order to limit Customs' control over the shipments.

Throughout the deception, Bruchhausen relied on telex machines to communicate with these agents.

On August 19, 1981, a federal grand jury indicted Bruchhausen and his confederates for offenses ranging from tax evasion to export violations. During the next four years, Bruchhausen eluded authorities. On May 8, 1985, however, British authorities apprehended him. He was extradited to the United States.

On June 6, 1985, a second grand jury indicted Bruchhausen on sixteen counts of wire fraud, in violation of 18 U.S.C. § 1343 1 and 18 U.S.C. § 2(b). 2 After a *467 bench trial, he was convicted of fifteen of these counts. On May 1, 1987, the district court sentenced Bruchhausen to fifteen years in custody and fined him $15,000. Bruchhausen appeals.

The statute provides:

Whoever, having devised or intending to devise any scheme or artifice to defraud, or for obtaining money or property by means of false or fraudulent pretenses, representations, or promises, transmits or causes to be transmitted by means of wire, radio, or television communication in interstate or foreign commerce, any writings, signs, signals, pictures, or sounds for the purpose of executing such scheme or artifice, shall be fined not more than $1,000 or imprisoned not more than five years, or both.

The statute provides:

Whoever willfully causes an act to be done which if directly performed by him or another would be an offense against the United States, is punishable as a principal.

18 U.S.C. § 2(b) (1984).

DISCUSSION

Bruchhausen contends that the wire fraud indictment was insufficient as a matter of law. We review this issue de novo. See United States v. Buckley, 689 F.2d 893, 897-98 (9th Cir. 1982), cert. denied, 460 U.S. 1086, 103 S.Ct. 1778, 76 L.Ed.2d 349 (1983).

The indictment defined Bruchhausen's objectives as follows:

a. [to] defraud American manufacturers of high-technology commodities of their property and their right to make business decisions based on truthful information and representations;

b. [to] defraud the United States and its executive agencies, namely the Department of Commerce, the Department of State and the Customs Service of their right to conduct their affairs free from stealth, chicanery, fraud, false statements and deceit.

According to Bruchhausen, the indictment improperly relies on intangible property rights. This contention is without merit. The wire fraud statute is not limited to possessory interests, and can extend to rights in intangible property.

;:,ee <.„-arpenrevr . umrea ;:,rares, 4~4 u.~. I l::1,~ ::>, 1u ~ ~.L;t. 316,320, 98 L.Ed.2d 275 (1987) (information's "intangible nature does not make it any less 'property' protected by the mail and wire fraud statutes"); 18 U.S.C. § 1346 (Supp. 1992) (amending fraud statutes to include schemes to deprive another of "the intangible right of honest services").

The real question is whether the government's and manufacturers' interests can be considered property rights within the meaning of the statute. The

government contends that two other statutes recognize its interest in the future alienation of American high technology products - the Arms Export Control Act, 22 U.S.C. § 2751 et seq., and the Export Administration Act of 1979, 50 U.S.C. App. § 2401 et seq. To enforce these statutes, Congress enacted forfeiture provisions that permit the government to seize the products. 50 U.S.C. App. § 2410(g); 22 U.S.C. § 401(a) .

From these provisions, the government would have us derive a property right.

We reject this construct. The government's potential forfeiture interest is too ethereal to fall within the protections of a statute that "had its origin in the desire to protect individual property rights." Cf. McNally v. United States, 483 U.S. 350, 358-59 n. 8, 107 S.Ct. 2875, 2881 n. 8, 97 L.Ed.2d 292 (1987).3 We accordingly hold that this interest cannot support Bruchhausen's indictment.

Congress overrode the result in McNally in 1988 by passing 18 U.S.C. § 1346, which provides that a scheme to defraud includes a scheme "to deprive another of the intangible right of honest services."

Section 1346 does not affect the analysis in McNa//yupon which we rely.

A closer question is whether the manufacturers were defrauded of "Property" withiin the meaning f the statue.

The manufacturers received the full sale price for their products; they clearly suffered no monetary loss. While they may have been deceived into entering sales that they had the right to refuse, their actual loss was in control over the destination of their products after sale. It is difficult to discern why they had a property right to such post-sale control.

The government argues, however, that the manufacturers lost part of their bargain because they would not have sold the products if they had been told that the products were destined for the Soviet Bloc. *468 Thus, the assurance that the products would be used domestically was, in the government's view, part of the consideration for the sale, and the manufacturers were defrauded of that portion of their bargain. The government relies on Carpenter v. United States, 484 U.S. at 25-28, 108 S.Ct. at 320-22 , in which the Supreme Court held that the Wall Street Journal was defrauded of "property" when its employees leaked to conspiring brokers the prepublication contents of columns discussing stocks. The Court stated that the Journal "had a right to decide how to use [the confidential information] prior to disclosing it to the public," and that a scheme to defraud did not "require a monetary loss." Id. at 26, 108 S.Ct. at 321. The government analogizes the Journal's intangible interest in controlling prepublication information to the manufacturers' intangible interest here in controlling the destination of their products.

The government's argument is not without force, but the analogy is a strained one. Carpenter relied in part on the fact that "[c]onfidential business information has long been recognized as property. [---]. There is no comparable understanding that a manufacturer has a property interest in the destination of its products. Of course the manufacturer may have an interest in assuring that its products are not ultimately shipped in violation of law, but that interest in the disposition of goods it no longer owns is not easily characterized as property.

If we are to rely on an analogy, McNally provides a closer one than Carpenter. In McNally, government employees purchasing insurance for the state required the seller to share its commissions with other companies in which the government employees had an interest. There was no showing that the state paid more for its policies than it otherwise would have, or that it received less insurance. The employees were convicted of mail fraud on a theory that their actions defrauded the citizens and government of the state of their right to have the state's affairs conducted honestly. The Supreme Court reversed, holding that, under such a theory, no "property" had been taken by fraud within the meaning of the mail fraud statute, 18 U.S.C. § 1341.

The Court noted that "the original impetus behind the mail fraud statute was to protect the people from schemes to deprive them of their money or property." McNal/y, 483 U.S. at 356, 107 S.Ct. at 2880 .

In McNally it was doubtless true that the state would not have permitted the policies to be purchased if it had known of the arrangement for sharing of commissions. Yet the state's or the citizens' legitimate interest in preventing dishonest redistribution of commissions paid by the government did not qualify as "property" within the meaning of the mail fraud statute. We see no reason why a similar result should not obtain under the wire fraud statute. the relevant language of which is identical to that of the mail fraud statute. We conclude, therefore, that the interest of the manufacturers in seeing that the products they sold were not shipped to the Soviet Bloc in violation of federal law is not "property" of the kind that Congress intended to reach in the wire fraud statute.

Our decision is colored by the rule of lenity. As the Court instructed in McNa/ly, we may choose the harsher view of the statute only when Congress has spoken in clear and definite language. Id. at 359-60, 107 S.Ct. at 2881-82 .

Section 1343 provides no guidance, and section 1346 refers only to the intangible right to honest services. 18 U.S.C. § 1343, 1346. In the absence of definite language, we must conclude that the manufacturers' interest cannot support a criminal prosecution. McNally, 483 U.S. at 359- 60, 107 S.Ct. at 2881-82 .4

In this regard, we respectfully disagree with the Second Circuit's approach in United States v. Schwartz, 924 F.2d 410 (2d Cir. 1991). In assessing the manufacturer's interest, that court did not address McNallyand Carpenter. Id. at 420-21.

In light of this conclusion, we hold that the second indictment was insufficient as a matter of law. We therefore reverse *469 Bruchhausen's convictions. 5 Bruchhausen may be subject to punishment under other statutes, but his alleged conduct does not constitute wire fraud against the United States or the manufacturers.

We find it unnecessary to address Bruchhausen's argument that the indictment failed to provide notice of the charges against him. We also decline to address his arguments based on the statute of limitations, the sufficiency of the evidence, and delay on appeal.

REVERSED; CONVICTION VACATED; REMANDED.

[23] KOZINSKI, Circuit Judge, concurring:

Because the majority opinion and Judge Fernandez's concurrence are entirely consistent, and each interprets the applicable law correctly, I join both.

[25] FERNANDEZ, Circuit Judge, concurring:

I agree with the majority that the United States was not defrauded of its property within the meaning of McNally v. United States, 483 U.S. 350, 107 S.Ct. 2875, 97 L.Ed.2d 292 (1987). I also agree that the right of manufacturers to make decisions based on truthful information is far too ethereal to be a property right for the purposes of the wire fraud statute. See Carpenter v. United States, 484 U.S. 19, 25, 108 S.Ct. 316,320, 98 L.Ed.2d 275 (1987).

However, I do not agree that a person has not been defrauded of his property when he is induced by fraudulent representations to transfer that property to another. In reaching the contrary conclusion, the majority puts far too much weight on the fact that the defrauded companies received a monetary payment equal to the fair market value of the property.

In my opinion, at the very least ownership of a tangible object, whether it is a pen, a desk, or a piece of equipment, includes the right to retain that object and to refuse to transfer it to others. The right persists even if others are willing to pay fair market value for the object. Were it otherwise, everyone would have a private right of condemnation over the property of others; everyone could simply take another's property at will as long as fair market value was oaid. That concept is far outside our traditions. It is an acceptance of Holmes's "bad man" theory of the law which, though realistic in some sense, should not define this area.

See Oliver W. Holmes, The Path of the Law, 10 Harv. L. Rev. 457, 459-62 (1897). Perhaps a contracting party can properly consider the contract to be one to perform or pay damages, although I am dubious. Surely, however, the duty owed to a person who owns property is not merely a duty to respect that person's rights or pay damages. In short , a person can wrongfully invade another's property even when willing to pay fair market value. By the same token, a person can fraudulently deprive another of property even when willing to pay fair market value. The strictures an owner puts on his willingness to sell an item are not mere ephemera. When a prospective buyer lies in order to evade those strictures , a fraud has been committed upon the owner of the item just as surely as if the buyer had issued a rubber check.

This is not an exotic proposition. See, e.g., Walker v. Galt, 171 F.2d 613, 614 (5th Cir. 1948) ("'The vendor has the right to select the person to whom he will sell. ... [F]raud may be predicated upon misrepresentations as to the identity of the purchaser .... "') (citation omitted), cert. denied, 336 U.S. 925, 69 S.Ct. 656, 93 L.Ed. 1086 (1949). Cf., Earl V. Saks Co., 36 Cal.2d 602, 610-13, 226 P.2d 340 (1951) (a contract can be rescinded when induced by fraud, even if no pecuniary harm has been suffered); 37 Am.Jur.2d Fraud and Deceit§ 284 (1968) ("If one obtains from an owner, by a false representation of a fact which he deems material, property that he would not otherwise have parted with ... there is such an injury as will he redressed by equity."). Also, as the majority points out, the •410 Sec and Circuit agrees with the position taken in this concurrence.

United States v. Schwartz, 924 F.2d 410, 420-21 (2dCir . 1991) .

Here the various sellers simply refused to sell to persons like Bruchhausen who intended to export equipment from the United States without permits. Indeed, at least one of them, Watkins-Johnson Co., required a certification that the property would stay in the United States, period. If a buyer would not cert ify to that , the company would not sell its goods to that buyer . When Bruchhausen lied in order to evade that condition, he did commit a fraud. That fraud was the obtaining of the property of another (the equipment) by means of false representations. Thus, I cannot agree with the majority's conclusion that Bruchhausen's behavior could not constitute a violation of the wire fraud statute.

the concept of a tangible deprivation of property, even though there was evidence to support a determ ination on that basis. Thus, the finding of guilt was at best based upon an undefined mixture of legal theories too ephemeral to support that finding and an essentially unarticulated legal theory which would support it. Given that , Yates v. United States, 354 U.S. 298, 77 S.Ct. 1064, 1 L.Ed.2d 1356 (1957), militates in favor of the majority's determination. I say this with much hesitation because we deal here with a bench trial rather than with a jury trial. Here, however, given the fact that McNally overturned what had long been our approach to the wire fraud statute, it would be taking theory to an extreme to insist that the learned district judge who presided over this case could have been following the Mc Nally strictures. See, e.g., United States v. Bohonus, 628 F.2d 1167, 1170-73 (9th Cir.), cert. denied, 447 U.S. 928, 100 S.Ct. 3026, 65 L.Ed.2d 1122 (1980). Moreover, the district judge's comments made it rather clear that she was not following the McNally approach and that she saw the whole matter as one unified decision rather than as discreet legal elements which supplied alternate pathways to a finding of guilt.

Thus, I concur in the result.

1992 - Somehow, Bruchhausen is listed as having a San Diego address in 1992 !

1989 (Fall) : U.S. Treasury Department / Customs journal (magazine)

Source PDF : [HP000H][GDrive]

In May 1985 Scotland Yard Inspector Vernon Williams ended five years of frustration for U.S. law enforcement authorities when he arrested Werner Bruchhausen, a West German businessman, in a London hotel.

For almost 10 years Bruchhausen had smuggled sophisticated U.S. equipment and technology to the Soviet Union and its satellite countries. He made a fortune—millions of dollars—from hundreds of illegal shipments of specialized military and dual-use electronics and communications systems. He shipped enough equipment to set up a complete integrated circuit manufacturing plant complete with 100 percent spares.

In all, Bruchhausen advanced Soviet computer chip manufacturing and related capabilities by perhaps a decade.

Clandestine meetings with Soviet agents, an international sting operation, double agents and a missed opportunity to apprehend him in Canada, and evidence suggesting a scheme involving East German agents to spring him from an English prison all added to the intrigue of this dramatic case of high tech banditry.

It began with a casual meeting at a trade fair in Munich, West Germany between a Russia trade official (a suspected Soviet GRU agent) and Bruchhausen, who was manning a booth at the fair. For 10 years, despite numerous legal impediments, Bruchhausen relentlessly prospered.

In February 1987 a federal judge found Bruchhausen guilty of 15 counts of wire fraud. Less than three months later the same judge sentenced him to prison. (As of this writing, Bruchhausen remains in a federal prison in Florida.)

To date, the Bruchhausen case remains the most successful investigation and prosecution by the U.S. Customs Service of illegal technology diversion. It was the catalyst for the Customs Service's Operation Exodus, the successful, ongoing high-tech diversion investigations program.

How the case developed, delays in its investigation and the methods used to snare Bruchhausen, once considered unextraditable from the sanctuary of a foreign nation, point o u t lessons to be shared by the export control community.

Bruchhausen earned a degree in communications engineering in 1962 in his native West Germany. In 1965 he opened his first independent business, representing U.S., British, and French electronic firms in West Germany. By the end of the sixties, Bruchhausen was well established in the electronics trade and had traveled extensively throughout Europe. In 1973, he established his first California corporations, all of which purchased or exported U.S. technologies.

Bruchhausen's first (documented) illegal export to the Soviet Union, a Data General 51230 computer system, occurred in 1978. Bruchhausen purchased the system for about $135,000 and sold it to the Soviets for about $263,000. This profit margin, which became typical in Bruchhausen's dealings with the Soviets, financed his opulent lifestyle. He wore cashmere coats and expensive suits, carried a walking stick, and lived in a lavish estate outside of Munich. He allegedly refused to drive a Mercedes because, "every farmer in Germany has one."

The Bruchhausen network

Twelve California companies operating under 18 different names from many different addresses worked closely with nine European companies to coordinate Bruchhausen's illegal diversions. This complex network of companies shared an equally complex system of double invoicing, shredded records and false trails.

Incorporated between 1973 and 1980, the California companies initially purchased the high-tech items sought by the Soviets. These items were then transferred to their European counterparts for final shipment to the Soviet Union or one of its satellites. These diversions almost invariably shared several traits: (1) The California companies misrepresented the planned destination and purpose of the purchases to the manufacturers, as well as on the Shipper's Export Declarations (which typically misrepresented the real identity and value of the goods being shipped); (2) export licenses were never sought; and (3) in virtually every case, the equipment was extremely sophisticated and would not have been granted an export license.

Bruchhausen's California companies employed only a few people, mainly to maintain appearances, but also to manage the unavoidable mundane business concerns. Through an ad in the Los Angeles Times, Bruchhausen recruited Tony Maluta, a Russian-born, naturalized American citizen, and Sabina Tittel, a German-hem naturalized American citizen, to operate these companies. Maluta was well suited for Bruchhausen's needs. As an engineer, comfortable in the world of high technology and fluent with some of its vernaculars, Maluta played well his role as a company vice-president. Most manufacturing companies had no reason to question his appearance.

Tittel, alleged at the trial to be Maluta's lover, managed the day-to-day affairs of the offices. Perhaps her most important duty was to ensure that the few other employees did not understand thae multiple invoices and other abnormal paperwork. (Evidence suggests Bruchhausen paid her well. In May of 1980, Customs seized companies' records that showed Tittel had already earned over $500,000 for that year).

Scant legitimate business

Bruchhausen‘s American companies conducted little or no legitimate business. The companies used professional stationery and business cards, and, although exporting was their business, the companies never applied for export licenses.

The European side of the network involved about nine companies in West and East Germany, Austria, and the Soviet Union. Bruchhausen owned several of these companies; a business associate, Dietmar Ulrichshofer, owned several more; and still others, financed by Bruchhausen, were legally owned by yet another individual. Ulrichshofer mainly supplied East bloc countries with equipment purchased from one of Bruchhausen's West German companies. Bruchhausen's principal company in West Germany was Analog und Digital Technik (ADT).

To protect ADT, which conducted some legal business in Europe, he created Techma, based in Dusseldorf, to deal exclusively with the Soviets. Bruchhausen formed Elmasch, in Bonn, again through the manager of Techma, to sell electronic components to East bloc countries. These buffer companies, in both California and Europe, kept the operations separate and Bruchhausen safe in the confusion they created.

Scope of operations

Maluta and Tittel's document shredder prevents us from ever knowing exactly how much money this network controlled. However, records seized in U.S. Customs raids in May 1980 give a glimpse of the scope of the companies' operations. Though incomplete, the records identified about $10.5 million of high-tech purchases made by California companies between 1977 and 1980. These purchases eventually landed in Soviet hands.

However, evidence presented at trial identified a four-year period in which Bruchhausen sent Maluta and Tittel about $100,000 a week for purchases, almost twice the $10.5 million figure.

The companies worked in pairs. For example, California Technology Corporation (CTC) would purchase equipment from U.S. manufacturers at original equipment manufacturer's prices.

Then, another Bruchhausen company, Interorga International Components, would export it, typically to an intermediary country - Vienna, Austria; Munish or Dusselford, West Germany; or Zurich, Switzerland.

Invariably, neither of the American companies took delivery of the purchases or legally transferred ownership; they went directly to a warehouse or freight forwarder for export. Tittel rented a desk in an otherwise empty office in Santa Monica, California, to use as an address for two of Bruchhausen’s "export" companies.

In Europe, the goods typically changed hands several times before the final hop to the proscribed destination. Maluta and Tittel prepared two invoices. One, which accompanied the goods to the US. freight forwarders, falsely identified equipment as fumances, machinery, meters or other vague and innocuous sounding products, and valued it at a small percentage of its actual worth.

The Shipper’s Export Declarations, filed with the US. Customs Service at the port of export, similarly misrepresented the products to reduce the chances of a

Customs inspection.

With the nation more concerned with interdicting incoming drugs than outgoing technologies at its borders, this simple hit of deception went mostly unnoticed.

A second, and accurate, invoice was sent to Bruchhausen in West Germany. The other principals generated more invoices, with varying descriptions and valuations of the goods, for the intermediate changes of ownership in Europe. The Soviets received yet another invoice; this one accurately described the goods.

In Europe, Bruchhausen “neutralized" the goods to erase records of the original purchaser or exporter. A common and legitimate business practice, neutralizing is used to prevent the ultimate customer from dealing directly with the manufacturer or original shipper; it protects the business interests of the middle man.

But Bruchhausen extended the technique to obliterate the trail. Usually, by the time the goods reached their final destination, the paperwork had gone through at least as many changes as the number of companies that had owned or forwarded the shipment. The records were so confusing, US. Customs investigators required a computer to reconstruct the Byzantine routes of more than a hundred of Bruchhausen's shipments.

Hugh profits

Bruchhausen's average markup was 199 percent; on some shipments he made as much as 1,000 percent profit. His associate Ulrichshofer, who often owned and forwarded the goods at some point in their journey to the proscribed destination, added an average markup of 215 percent.

Despite these profits, the Soviets readily paid the bill for technologies they might otherwise have to do without or develop themselves. According to Lara Baker of Los Alamos National Laboratory, an expert in computer manufacturing technologies who analyzed the equipment and information that the Soviets got through Bruchhausen,

“The Soviets knew exactly what they wanted. They showed very good taste. They got the state-of-the art equipment. They knew it down to nine and ten digit part numbers."

Collapse

Bruchhausen's scheme eventually collapsed under the weight of suspicious U.S. manufacturers and U.S. and West German Customs investigations that included a sting operation in which Customs investigators substituted sand for the state-of-the-art equipment bound for Moscow.

In March of 1980, officials at the Gasonics Corporation, which produced the most sophisticated silicon chip manufacturing equipment in the world, contacted the Department of Commerce. They were suspicious of a company called California Technology Corporation. Its vice-president, Tony Maluta, had expressed interest in purchasing two of their high-pressure oxidation (Hipox) systems, at that time the most advanced machinery for growing oxides on silicon microchips.

According to Theodore Wu, then a federal prosecutor, subsequently head of the Commerce Department's enforcement operations, “My understanding was that at the time the Gasonics equipment was so state of the art, an export license would not have been granted even to a NATO country."

Initially, Maluta told dubious Gasonics officials that CTC needed the Hipox systems for a secret U.S. Army installation in Arizona. In May, Maluta paid cash for two Hipox systems and instructed Gasonics to deliver them directly to Kamino, an international freight forwarder, because CTC's manufacturing plant in the San Fernando Valley had just burned.

By then, both Commerce and Customs were following the developments with great interest; Gasonics was keeping Customs informed of the transaction.

Convinced that the equipment was earmarked for illegal export (the Shipper’s Export Declaration misrepresented the equipment's identity, value and ultimate destination), Customs officials had identical crates built, filled them with pounds of sand, and allowed them to continue just as Bruchhausen and his associates had planned.

The West German Customs Service in Dusseldorf agreed to cooperate in the investigation. Their agents followed the crates from Munich to an intransit holding facility near the Austrian border. By then, five separate companies had "owned" and transferred the shipment. It was now tagged for a KLM/Aeroflot flight to Moscow.

At about that time Stephen Dodge and Theodore Wu visited the West German Customs Service and entered a formal agreement to exchange documents and information. When Dietmar Ulrichshofer discovered the sand, U.S. and German Customs had served search warrants at various Bruchhausen companies and principals' residences.'

In all, they recovered about 45,000 documents. Those recovered in California - inquiries, purchase orders, telexes between Bruchhausen and the California companies, export freight bills - revealed the purchasing end of a major operation. The documents seized in Europe (Bonn, Munich and Dusseldorf) provided a picture of the delivery side of the operation.

Dodge spent 10 months doing nothing but reading the documents, trying to piece together a coherent picture of the magnitude and methods of Bruchhausen's operations. Eventually, using a computer to sort and correlate the information, Dodge was able to trace 102 shipments from California, through Europe, to a final destination in the Soviet Union or East bloc.

The work resulted in a 60-count indictment against Bruchhausen, Ulrichshofer, Maluta and Tittel.

In 1981 Maluta and Tittel plead guilty to illegal export. Federal Judge William Matthew Byrne, Jr. sentenced Maluta and Tittel to five and two years, respectively, in federal prison. The judge also fined Maluta $60,000 and Tittel $25,000. These were the stiffest sentences the courts had ever meted out for illegal export of high-technology equipment.

Still, the mastermind, Bruchhausen, remained free, almost flaunting the nature of his continuing business - he called one of his West German companies American Data Technology.

The West German Customs Service had cooperated in the investigation, but Bruchhausen and Ulrichshofer were n o t extraditable under existing treaties. Most Western European countries consider illegal export to be a political, and therefore n o t extraditable, offense

Extradition and trial

Although untouchable, Bruchhausen was not forgotten. Unbeknownst to him, a Greek undercover informant had been shadowing Bruchhausen for several months before his arrest. (After the investigations in 1981, Bruchhausen relocated the bulk of his continuing operations to Greece, Turkey and Bulgaria.)

U.S. and British authorities were aware of Bruchhausen's trip to England, via Zurich, to arrange the delivery of some VAX computers to Bulgaria. In fact, Scotland Yard agents awaited him at Heathrow Airport and followed him for six days before making the arrest.

U.S. authorities were elated when they learned of Bruchhausen's arrest in London - unlike West Germany, the British government was able to act on an extradition request.

Still, British law allowed authorities to hold Bruchhausen for a limited time on the false passport charge, No extradition treaties specifically covered illegal export. However, Bruchhausen was extraditable under a general extradition treaty with England and North Ireland, ratified by the U.S. Senate in June 1976. Two of the long list of offenses covered by the treaty fit Bruchhausen's crimes: 1) obtaining property, money or valuable securities by false pretenses or other form of deception; and 2) false accounting.

But the clock was ticking - U.S. authorities had only about two weeks to submit, through the Justice and State Departments, an extradition package to the British government.

The first order of business was to re-indict Bruchhausen for crimes that fit the treaty. He had used a teletype for all of his communications with Maluta and Tittel, which, considering the nature of his business, constituted wire fraud.

U.S. Customs had seized boxes of these telexes in their 1980s raids. In addition, the misrepresentations Maluta made to American manufacturers and the false documents that accompanied Bruchhausen's shipments constituted fraud against both the manufacturers and the federal government.

Within a week, William Fahey and Ronald Boos, the U.S. attorneys who subsequently prosecuted the case, put together a second indictment package against Bruchhausen consisting of 15 counts of wire fraud. Although hastily put together, the document satisfied Fahey and Boos. The maximum jail term of five years for fraud was the same asthat for illegal exporting, and 15 counts were enough to justify a fair jail term. A quickly convened grand jury returned the indictment.

The next order of business was to prepare an extradition package for the British government.

Dodge flew up and down the West Coast in a Customs airplane to gather affidavits. After several false starts, Dodge became almost desperate, afraid that Bruchhausen might slip free while Dodge got more and more tangled in legal requirements. "You talk about scramble! We had about a week left to get our act together," Dodge recalls.

The State Department sent an extradition package to the British government just days before Britain would have been forced to free Bruchhausen. The British accepted the package, and in October 1985 ordered Bruchhausen to be extradited.

Getting him on a plane proved another matter because Bruchhausen immediately appealed the British decision. Finally, in June 1986the House of Lords, Bruchhausen's last resort, allowed the extradition order to stand. U.S. federal officials immediately flew Bruchhausen to California to await trial.

Throughout the extradition appeal process Bruchhausen remained in British prison. British authorities considered him a flight risk, particularly in view of a possible plan for escape.

Allegedly while in custody in Great Britain, Bruchhausen made arrangements with East German (GDR) agents to pick him up from an undisclosed location with a helicopter, and transfer him to the GDR. British authorities searched his cell and found maps of several London airports, a credit card, and other items that suggested an escape attempt was in the works.

The case

Dodge had put together continuous paper trails (from purchases in California to delivery to the Soviets or the East bloc) for 102 of the approximately 300 shipments attributed to Bruchhausen. Of these 102, the prosecution presented 13 during the trial.

To prove a scheme, the prosecu~ tion presented evidence regarding the purchase, lack of export license, shipment routes through intermediate countries and final delivery to the Soviet Union.

To prove false statements, Fahey and Boos presented documents, given to American manufacturers by Maluta and Tittel, that indicated no export was planned, as well as fraudulent Shipper's Export Declarations. In all, the prosecution presented 15 false statements associated with the 13 shipments.

To prove that wire communications had figured in the scheme, the prosecution presented the telexes that had been seized in the 1981 Customs raids.

Export violation cases are unique in their typical use of international witnesses and the sheer volume and complexity of documentary evidence. The Bruchhausen trial was no exception.

The prosecution submitted 218 exhibits comprising more than 2,000 documents and called 30 witnesses, including European law enforcement agents, West German Customs officials, technical experts who demonstrated the enormous benefit the Soviets gained from doing business with Bruchhausen and employees of his California corporations.

The prosecution also entered into the court record excepts from interviews the West Germany Customs Service conducted with Bruchhausen in 1982, in which he described his intent to establish a confusing network of interrelated companies. In addition, in a 1982 interview with the BBC, Bruchhausen . . . insisted that it was not illegal to ship the goods from the United States to West Germany, from there to Switzerland and from Switzerland to the Sovietbloc. He characterized his operations as follows: " I t might have been a slight infringement of the rules, but it's no crime.

The defense attorney, Alan May, presented Bruchhausen as a successful, although somewhat naive businessman interested in contributing to the spirit of detente and taking advantage of it to further his business interests. "Maluta did it" was the thrust of the defense.

After four weeks of testimony, Judge Alicemarie Stotler, in a very brief decision, found the evidence "indeed overwhelming" and Bruchhausen guilty of all 15 counts. On May 1, Judge Stotler sentenced Bruchhausen to 15 years in federal prison and fined him $15,000 - one year and $1000 for each count.

What Bruchhausen shipped

The equipment Bruchhausen and his associates shipped was among the most sophisticated of the time. In testimony to the U.S. Senate in 1982, Lara Baker

described the Bruchhausen pipeline as "certainly one of the most successful for the Soviet Union, and perhaps one of the most damaging to the U.S."

Baker examined documentation (seized by Customs in the United States and Europe) on more than 400 Bruchhausen shipments to the Soviet Union and the East bloc. All of these shipments were illegal – no export license had been sought and none would have been granted.

Among the most significant of the Soviet purchases were those used to equip a complete, medium-sized integrated circuit production plant. At the time, process control and quality assurance problems seriously hampered the Soviet integrated circuit/ microcomputer development industry.

Other equipment Bruchhausen shipped, not related to integrated circuit development and production, included high-speed oscilloscopes, military microwave and radio receivers, and hundreds of electronic cables, testers, circuits and related pieces of hardware.

Bruchhausen even instructed Maluta in a telex to get the optics from the Surveyor spacecraft. For once, in a return telex, Maluta refused.

The Watkins-Johnson microwave tuners the Soviets received had direct military applications. These systems operated in the frequency range used by NATO forces. One of the systems included an antenna designed for missile tracking and telemetry applications. Another shipment, 10,000 256-bit random access memory (RAM) circuits in military packages, had possible direct military applications.

Typically, the Soviets use Western equipment for R&D rather than in fielded military systems. At the time the Soviets were capable of manufacturing RAM circuits. A reasonable inference is that the Soviets procured these circuits for an existing system.

The continuing saga

Bruchhausen established acquisition and delivery networks at will, and continued to sell proscribed goods to the Soviet block after authorities shut down his California companies.

After his arrest, Swiss authorities seized a suitcase belonging to Bruchhausen, then turned it over to the U.S. Customs Service. He had been storing it in a Swiss locker, perhaps to protect it from possible seizure at one of his German addresses.

The suitcase contained hundreds of documents - business records, personal notes and business cards of his American, Soviet, and European associates - as well as numerous original Bulgarian and Czech shopping lists ,purchase orders, and evidence of completed sales to the Soviet bloc.

The records in the suitcase indicated that between 1983 and 1985 Bruchhausen shipped e equipment that could be used for engineering and development of logic and microcircuit technologies.

The following equipment was shipped, probably through a Zurich based company, to Czechsolvokia and Bulgaria, and additional orders worth millions of dollars were pending.

- Thousands of semiconductor devices made by Advanced Micro Devices, National Semi-conductor, Motorola, and Intersil (est. $63,000)
- One DEC Vax 11/730 computer ($135,000)
- One Intel Corporation logic development system ($105,000)
- One Hewlett Packard semiconductor analysis system ($38,360)
- Nine CAD/CAM systems (eight of which were Megatek) (est. $1,165,000)
- Two Tektronix hard disk systems ($15,000)
- One Tektronix instrument ($20,000)
- One MTS single disk certifier ($370,000)
- One GCA/D.A. Mann Mod. 4800 direct step-on wafer system ($65,000)
- Control Data Corp. disk drives and DEC computers 780/730 ($1,109,000)
- Tektronix computer graphics terminals ($150,000)

.. Then and Today section

Then

Enforcement of export regulations has changed dramatically since Bruchhausen's chicanery came to light. The initial, sluggish response to reports of his activities, described below, is no longer typical.

The first tips were two anonymous letters, both signed “former employees," sent to the U.S. Consulate in Dusseldorf. The first letter arrived in 1977, and accused Bruchhausen of violating U.S. export controls and falsifying export documents.

The second letter arrived about nine months later, in 1978, and contained even more details, including copies of documents proving that Bruchhausen had shipped commodities to a proscribed country.

The Consulate translated the letters, then forwarded them to the Commerce Department Compliance Division. About a year and nine months after the first letter to the Consulate in Duseldorf, Perkin-Elmer Company reported to Commerce that Bruchhausen's CFC was probably a front; Maluta had represented several companies, with various addresses.

The Commerce Compliance Division sent an agent to interview Maluta, who could not produce an export license application for the equipment in question, a Micralign semiconductor testing machine worth $150,000. Maluta said that he knew little about export license requirements, and cancelled the shipment. Bruchhausen and his American employees later referred to the affair as the "Perkin-Elmer problem".

Eight months later, Fairchild contacted the COmmerce Department, the Office of Defense Intelligence and the FBI. Maluta had ordered $740,000 worth of semiconductor memory test systems. A routine investigation by the Fairchild export administration manager had made that company suspicious. However, none of the federal agencies expressed concern because Maluta had signed a standard declaration stipulation that Department of Commerce regulations would be observed if the equipment were resold.

About a month later, Watkins-Johnson wrote Commerce for advice. Bruchhausen's companies had changed names frequently and Maluta had four orders pending for microwave receiving and antenna systems, totaling over $980,000. Special Agent Robert Rice became involved and learned that Maluta had told Watkins-Johnson that one of the systems was to be used at the Army's Fort Huachuca, in Arizona. Headquarters there informed Rice they had never ordered anything from Maluta.

(Also, Maluta had previously purchased similar systems and refused installation, instruction or repair assistance.) At that point, more than three years after the first tip, the Commerce Department contacted Dodge and Wu and the investigation began.

... And Today

Today, the Department of Commerce plays a principal role in the enforcement of export laws. Under Title 28, 1982, the Commerce Department's enforcement staff became separate from other export administration activities and increased from a handful of investigators (who made up the old Compliance Division) to more than 160 full-time enforcement officers, with arrest and seizure authority

There are now eight domestic field offices, as well as offices in Sweden and Austria. About 35 intelligence specialists work in enforcement - more than the entire staff of the Compliance Division when the Bruchhausen case was originally investigated.

According to Wu, who became Deputy Assistant Secretary for Export Enforcement (created under title 28), "The foreign field offices have raised international sensitivities and increased cooperation in investigations and prosecution." In addition, the cooperation among U.S. enforcement agencies has improved dramatically. Joint Commerce, Customs, and FBI investigations are common Again, according to Wu, 'The working atmosphere between Commerce and Customs has improved enormously. We have daily contact."

The Customs Service has also increased and redirected its exports enforcement activities. The Exodus operations are supported by the Office of Enforcement and the Office of Intelligence, which employ about 1,600 people. Twelve hundred work in criminal investigation and about 400 work in intelligence, including about 200 analysts who identify trends and conduct other analyses.

A Customs-to-Customs agreement with Sweden, signed during the summer of 1987, allows the US. Customs Service to cooperate directly with the Swedish Customs agency on investigations of illegal diversions of technology and armaments, bypassing other diplomatic channels.

Extract from the resolutions passed at the extraordinary general assembly on July 31, 2015.
First decision

The General Meeting decides to accept the resignation of the following members of the Board of Directors:

- **Mr. Pierre EKAMBA LOUMA**, delegate of the board of directors

- Mr. Klaus-Peter WASCHEWSKI

The following are appointed as new board members:

- Mr. Wermer BRUCHHAUSEN, dipl. Engineer residing in D-44139 Dortmund, Rheinlanddamm, 6

- Mr. Olivier LAM, Kauffmann, residing at F-06100 Nice, 2, rue Louis Roubaudi

The mandates of the members of the Board of Directors end with the Ordinary General Meeting of Shareholders which will take place in 2017.
Second decision

Mr. Wermer BRUCHHAUSEN, is appointed delegate of the Board of Directors with the authority of day-to-day management and the right to always represent the company alone. His mandate ends with the Ordinary General Meeting of Shareholders which will take place in 2017.
Third decision

The General Assembly decides to resign the current Commissioner LUX-AUDIT S.A. to accept. Mr. Robert ELVINGER, tax consultant, with professional address L-1370 Luxembourg, 16, Val Ste Croix, will become the new commissioner. His mandate ends with the Ordinary General Meeting of Shareholders which will take place in 2017.

Gazette Notice

Gazette Notice

In the year two thousand and eleven the fourteenth of February.

In front of the signed notary Joseph ELVINGER, based in Luxembourg.

An extraordinary general meeting of shareholders of the holding company DOMINGA HOLDING Aktiengesellschaft takes place, based in Luxemburg, 16, Val Sainte Croix;

Company mentioned, registered in the Luxembourg Trade and Companies Register, Section B under number 52247.

The meeting will take place under the chairmanship of Mr. Robert Elvinger living in Luxembourg.

The Chairman appoints as secretary and the meeting elects Ms. Flora Gibert, resident in Luxembourg, as the auditor.

The chairman opened the meeting and made the following statements, which the acting notary recorded.

A.- That a attendance list drawn up by the meeting board shows that all shareholders are present or legally represented in the current meeting; This attendance list, countersigned by the shareholders or their representatives and signed by the acting notary public, remains attached to the current deed to be registered with it, as well as the powers of attorney of the represented shareholders duly initialed by the appearing party and the acting public notary.

B.- The fact that the general meeting, in view of the presence or representation of all shareholders, is regularly composed and can pass validly on all items on the agenda.

C.- That the agenda includes the following:
Agenda

1. Change of the statute of the company, which from then on no longer has the status of a holding company according to the law of July 31, 1929, but that of a Soparfi share company.

2. Accordingly, amendment to Article 4 of the Company's Articles of Association regarding the purpose of the company:

"The purpose of the company is to acquire participations in any form in other domestic and foreign financial, industrial or trading companies. The company can acquire all types of securities and rights, be it through deposit, subscription, purchase option, purchase or otherwise, and sell the same through sale, assignment, exchange, or otherwise, and the Company may acquire and exploit patents and concessions, and may provide any support to the companies in which it is directly involved, whether through loans, guarantees, advances, or otherwise.

The company will generally carry out all financial, commercial and technical actions required to protect its rights and its corporate purpose. "

3. Removal of any reference to the 1929 Law in the articles of association.

4. Changes to the social contract in this regard.

After these points have been presented and confirmed by the General Meeting, the shareholders unanimously decide as follows:
First decision:

The assembly decides to give up the tax status created by the law of July 31, 1929 bereffend Holding and to assume the status of Soparfi.
Second decision:

In order to adapt the Articles of Association to the previous decision, the Assembly decides to amend Articles 4 and 1 of the Articles of Association as follows:

"Art. 4. The purpose of the company is the acquisition of participations in any form in other domestic and foreign financial, industrial, or trading companies. The company can acquire all types of securities and rights, be it through deposit, subscription, purchase option, Purchase or otherwise, and sell the same through sale, assignment, exchange, or otherwise. In addition, the Company may acquire and exploit patents and concessions; the Company may provide any assistance to the companies in which it is directly involved, whether through loans, guarantees, Advances or whatever.

The company will generally take all financial, commercial and technical actions required to safeguard its rights and its corporate purpose ".
Third decision:

The Assembly decides to amend Article 25 of the Statutes as follows:

"The law of August 10, 1915 on commercial companies and its subsequent amendments apply unless otherwise provided in these statutes.

The meeting is closed with no further items on the agenda.

About document, Recorded in Luxembourg, In the year, month and day as mentioned at the beginning.

And after the lecture, the aforementioned comparators signed the present deed together with the acting notary.

Signé: R. ELVINGER, F. GIBERT, J. ELVINGER.

Enregistré à Luxembourg A.C. le 16 février 2011. Relation: LAC / 2011/7742

Registered in Luxembourg A.C. on February 16, 2011. Relationship: LAC / 2011/7742. Received seventy-five euros (75.-?)

The Receiver (signed): Francis SANDT.

FOR CONFORMITY SHIPPING, delivered to the company on request

Luxembourg, February 23, 2011.

Publication reference: 2011027392/69.

(110033750) Deposited in the Luxembourg Trade and Companies Register, February 24, 2011.

Evidence Timeline

2008 (May 24) - Chris Brummer garners SEC Fellowship

https://law.vanderbilt.edu/news/chris-brummer-garners-sec-fellowship/

Next year, Professor Chris Brummer will become the first Academic Fellow for the Securities & Exchange Commission's Office of International Affairs.

Chris Brummer, whose scholarship focuses on securities regulation, **will spend part of the 2008-09 academic year as an Academic Fellow with the Securities & Exchange Commission's Office of International Affairs.**

Professor Brummer will be the first SEC Fellow to work with the SEC's Office of International Affairs (OIA), the arm of the SEC that addresses cross-border securities transactions. At the SEC, the OIA facilitates international regulatory and enforcement cooperation, the adoption of high regulatory standards worldwide and the development of technical assistance programs to strengthen the regulatory infrastructure in global securities markets.

"My research involves assessing how securities regulators coordinate with one another to formulate policy with regards to cross-border securities transactions," he explains. "In the U.S., the OIA is the focal point of such activity. This is quite an exciting time to be a research fellow in this office, because no other issue is quite as important right now as the issue of globalization."

Professor Brummer's research will address issues such as the regulation of new financial products, many of which are created in the U.S. and then sold overseas, as well as how to allow foreign companies to sell securities to investors. "I'll be analyzing the impact of SEC rules and actions on foreign market participants active in the United States, and advising the SEC regarding the effect of U.S. regulations on cross-border activities," he says. "There are concerns and questions about how to regulate new markets. There's obviously a need for cooperation on that front. In addition, as more companies choose to raise capital outside of the United States, there's a big push to ensure the competitiveness of American financial institutions. My role will involve researching those kinds of issues and providing analytical support and advice to senior staff on issues of regulatory policy."

Professor Brummer looks forward to the opportunity to gain a "deep, institutional understanding" of the inner workings of the Securities & Exchange Commission. "It's a somewhat unique opportunity," he says. "No scholar has had the opportunity to be embedded in the Office of International Affairs."

Professor Brummer joined Vanderbilt's law faculty in 2006, after practicing in the New York and London offices of Cravath Swaine & Moore. He teaches courses in Securities Regulation and International Business Transactions and is affiliated with both Vanderbilt's Law & Business and International Legal Studies programs.

Stock Exchanges and the New Markets for Securities Laws

Chris Brummer†

Introduction

For nearly a decade, leading scholars have bemoaned the absence of what can be termed a market for securities laws.[1] Unlike the federalist structure of US corporate law, which may incentivize some states to compete for corporate charters, no competition for firms animates the enactment of national securities laws. Instead, the federal government has enjoyed a virtual monopoly over the provision of securities laws. Ever since the passing of the Securities Act of 1933[2] ("Securities Act") and the Securities Exchange Act of 1934[3] ("Exchange Act"), firms have generally had to comply with US securities laws when selling their stocks and bonds to American investors. And because US stock exchanges were the most liquid in the world, there was little danger of foreign multinationals going elsewhere to raise capital. As a result, federal regulators have had few incentives to formulate efficient regulatory policies.

A revolutionary transformation of global equity markets is, however, currently underway. American stock exchanges are no longer unrivaled venues of capital market activity. Instead, foreign exchanges have developed liquid markets of their own, and now consistently attract over 90 percent of the world's initial public offerings (IPOs) and half of all investor activity.[4] The success of foreign exchanges has sparked

† Assistant Professor of Law, Vanderbilt University Law School. This Article has benefited from the comments and suggestions of Professors Bobby Ahdieh, Douglas Baird, Margaret Blair, Bill Bratton, William Christie, Steven Davidoff, Gillian Hadfield, Paul Heald, Larry Helfer, Donald Langevoort, David Millon, Erin O'Hara, Bob Rasmussen, Hans Stoll, Bob Thompson, Joel Trachtman, and Todd Zywicki. The Article also benefited from faculty workshops at the University of Georgia, the University of Pennsylvania, the University of Southern California, and Northwestern University. I would also like to thank Murray Teitelbaum, James Duffy, and the staff of the New York Stock Exchange for their time and valuable insight.

1 The notion that such a market is missing in securities regulation was popularized in Roberta Romano's seminal article. See generally Roberta Romano, *Empowering Investors: A Market Approach to Securities Regulation*, 107 Yale L J 2359 (1998) (advocating competitive federalism for securities regulation where states compete for investors by offering different sets of securities laws).

2 15 USC §§ 77a–77bbbb (2000).

3 15 USC §§ 78a–78mm (2000).

4 Committee on Capital Markets Regulation, *Interim Report of the Committee on Capital Markets Regulation* 2 (Nov 30, 2006), online at http://www.capmktsreg.org/pdfs/11.30Committee_Interim_ReportREV2.pdf (visited Aug 29, 2008) ("Interim Report") (stating that the US share of

Page 01

consolidation in the trading industry as US stock exchanges, including the behemoth New York Stock Exchange[5] (NYSE) and Nasdaq,[6] have moved to acquire major European competitors in order to regain market share. These new transatlantic combinations will have significant implications for the regulation of securities. Perhaps most important, US exchanges will be able to provide an alternative through their foreign affiliates' listing services for companies seeking to avoid costly disclosure and corporate governance regulations like the Sarbanes-Oxley Act of 2002[7] ("Sarbanes-Oxley" or SOX) that attach when securities are traded in the United States.

Several scholars have acknowledged that the growing competitiveness of foreign exchanges and capital markets may pressure US regulators to provide regulation that more effectively attracts issuers to the United States,[8] a perspective which is likely to gain currency as American regulators incur significant reputational losses in the wake of the US-generated credit crisis.[9] However, virtually no commentator has provided a theoretical framework for assessing these developments in the securities industry.[10] Academics have instead largely fo-

global IPOs declined from 48 percent in the 1990s to only 6 percent in 2005, and its share of global stock market activity dropped from 60 percent in 2000 to 50 percent in 2005).

5 See *NYSE and Euronext in $20bn Merger*, BBC News Online (June 2, 2006), online at http://news.bbc.co.uk/2/hi/business/5039412.stm (visited Aug 29, 2008) (reporting that the NYSE agreed to buy the pan-European Euronext exchange in response to competitive pressures).

6 See Nick Clark, *Nasdaq Poised to Complete OMX Deal*, The Independent (UK) 40 (Jan 3, 2008) (reporting that Nasdaq will take over the Nordic group OMX after it concedes a 19.9 percent stake in the combined company to Borse Dubai).

7 Sarbanes-Oxley Act of 2002, Pub Law No 107-204, 116 Stat 745, codified at 15 USC § 7201 et seq (2006).

8 See, for example, James D. Cox, *Rethinking U.S. Securities Laws in the Shadow of International Regulatory Competition*, 55 L & Contemp Probs 157, 157 (1992). See also Eric J. Pan, *Why the World No Longer Puts Its Stock in Us* *9 (Cardozo Legal Studies Research Paper No 176, Dec 2006), online at http://papers.ssrn.com/abstract_id=951705 (visited Aug 29, 2008).

9 See Philip Stephens, *The Financial Crisis Marks Out a New Geopolitical Order*, Fin Times 9 (Asia ed, Oct 10, 2008). Some commentators and leaders have furthermore argued that the United States will lose its superpower status in the world of international finance. See Bertrand Benoit, *German Minister Predicts US Will Lose Financial 'Superpower Status,'* Fin Times 1. See also Andrew E. Kramer, *Moscow Says U.S. Leadership Era Is Ending*, NY Times A6 (Oct 3, 2008). As a result, regional financial centers have sought to displace now largely discredited US capital markets. See Ariana Eunjung Cha, *Financial Hubs See an Opening Up at the Top*, Wash Post D01 (Oct 1, 2008). The degree of success they will have is, however, unclear.

10 Notably, John Coffee has perceptively argued that cross-listings between exchanges may create pressures on regulators to provide credible, and often stringent, regulation. See generally John C. Coffee, Jr., *Racing towards the Top?: The Impact of Cross-listings and Stock Market Competition on International Corporate Governance*, 102 Colum L Rev 1757, 1757 (2002). However, this account focuses primarily on how stricter US regulations may pressure foreign regulators to provide more stringent regulation, not the other way around. See Larry E. Ribstein, *Cross-listing and Regulatory Competition*, 1 Rev L & Econ 97, 99 (2007) (noting that Coffee's model involves a "limited" form of regulatory competition in which a firm opts into a stricter regime in the United States). Stephen Choi and Andrew Guzman have also emphasized the

Page 02

I. The Presumption of Regulatory Monopoly

A. Territorial Governance of Securities Transactions

US securities law takes what many scholars consider to be a paternalistic approach to investor protection: firms wishing to buy or sell stocks to the public, or in a way that impacts the US economy, are not permitted to bargain with investors individually or to negotiate independently rules governing the quality of information they may provide investors. Instead, a mandatory set of rules applies.[12] Most notably, federal laws generally require that firms file with the government a registration statement disclosing sensitive financial information relating to their operations.[13] Issuers may also potentially have to distribute a prospectus to investors containing a portion of the registration statement before sales are allowed as well as provide periodic disclosures concerning the firm's economic activities.[14] These disclosures must be made with no material misstatements or omissions, or issuers will be subject to possible civil and criminal sanctions.

Compliance with US securities laws, as in most countries, is ensured by a "territorial" or geographically based approach to jurisdiction exemplified in the Securities Act and the Exchange Act. Under the Securities Act, all individuals seeking to sell stocks and bonds in the United States who make means of "instruments of transportation or communication in interstate commerce" must comply with the country's disclosure laws.[15] The Exchange Act meanwhile dictates that listing a security on a stock exchange located in the United States subjects an issuer of securities to US registration requirements.[16] Thus if a firm wishes to seek financing from any of the country's vast capital markets—the NYSE, Nasdaq, or the American Stock Exchange—the firm must become subject to US securities laws. The Exchange Act further holds that an issuer must generally file a registration statement

12 Romano, 107 Yale L J at 2365 (cited in note 1). Those mandatory rules may, however, have notable and important exemptions. See note 63 for a discussion of Rule 144A transactions.

13 See 15 USC § 77e (2000) (outlining § 5 of the Securities Act of 1933, the cornerstone of the regulation of primary transactions in the United States). Numerous exceptions do exist, however. See Thomas Lee Hazen, *The Law of Securities Regulation* § 4.1–4.36 at 177–294 (West 4th ed 2002).

14 Choi and Guzman, 71 S Cal L Rev at 909 (cited in note 11).

15 "Interstate commerce" is defined by the statute as implicating "trade or commerce in securities or any transportation or communication relating thereto" of one "state, territory or the District of Columbia" with another. 15 USC § 77b(a)(7). Issues deemed to be made outside the US are exempt from the statute's registration requirements. Because under the terms of the Act interstate commerce includes not only transportation "between any foreign country and any State, Territory, or the District of Columbia" but also communications via email, internet, or phone lines, virtually all sales involving US persons—as well as many foreign transactions—are covered by the Securities Act. Id.

16 15 USC § 78l(a) (2000).

Page 06

if it has assets in excess of $10 million and a class of equity securities held by at least five hundred shareholders worldwide (of whom at least three hundred are US investors).[17]

By attaching to both interstate trading activities and US-based intermediaries facilitating investment, federal securities laws provide deep geographic coverage touching virtually all "transactions that occur within its borders, or that have substantial effects within its territory."[18] Issuers and investors wishing to sell stocks and bonds in the United States are unavoidably bound by US securities laws unless exempted by regulators. And in some limited instances, territorially based securities laws may even have an extraterritorial reach where foreign transactions touch or have a connection to the United States.[19]

B. Choice-of-Law Reforms and Pure Regulatory Markets

Though the broad reach of US securities laws was designed to ensure the protection of US investors from fraudulent and abusive practices, the territorial basis of US securities law has been criticized extensively in the literature.[20] If one views regulation as the price a national regulator charges issuers in order to sell their securities in their home market, regulators, as the sole sellers of law, have monopoly power over the price they charge firms.[21] Critics consequently argue that federal regulators may not have much incentive to offer optimal regulation or

17 See 15 USC § 78l. Notably, however, under Rule 12g3-2(b), such foreign issuers can enjoy an exemption from registration under this provision where a foreign listing is maintained and the US trading volume of its securities is no greater than 20 percent of the security's worldwide trading volume. See 17 CFR 240.12g3-2(b)(1)–(5). See also Larry D. Soderquist, *Understanding the Securities Laws* § 9.3 at 9-3 (PLI 2004).

18 Frederick Tung, *From Monopolists to Markets?: A Political Economy of Issuer Choices in International Securities Regulation*, 2002 Wis L Rev 1363, 1371. Relief from registration is available only to issuers that have chosen not to use exchanges to sell securities. See 17 CFR § 240.12g3-2 (2007). See also James D. Cox, Robert W. Hillman, and Donald C. Langevoort, *Securities Regulation: Cases and Materials* 552 (Aspen 5th ed 2006).

19 This is particularly the case in the United States under § 5 of the Securities Act and Rule 10b-5 of the Exchange Act. See Choi and Guzman, 71 S Cal L Rev at 909 (cited in note 11) (discussing the expansive extraterritorial reach of the Securities Act over any offerings that have a connection, no matter how remote, to the United States).

20 See generally Romano, 107 Yale L J at 2362–63 (cited in note 1) (noting that US investors are often harmed by the expansion of US securities jurisdiction because foreign firms often exclude them from takeover offers in order to avoid the application of US law); Choi and Guzman, 71 S Cal L Rev at 918 (cited in note 11) (maintaining that the strict territorial approach to jurisdiction is flawed because it binds together two separate aspects of value for investors—the capital and regulatory regimes of the country).

21 See Roberta Romano, *The Need for Competition in International Securities Regulation*, 2 Theor Inq in L 387, 390–96 (2001) (asserting that a market for regulatory regimes is superior to a monopolist regulator or "regulatory cartel" of internationally harmonized regimes). See also Tung, 2002 Wis L Rev at 1379 (cited in note 18); Joel P. Trachtman, *Regulatory Competition and Regulatory Jurisdiction*, 3 J Intl Econ L 331, 334 (2000).

CROWDFUNDING:

MAXIMIZING THE PROMISE AND MINIMIZING THE PERIL
A ROUNDTABLE DISCUSSION

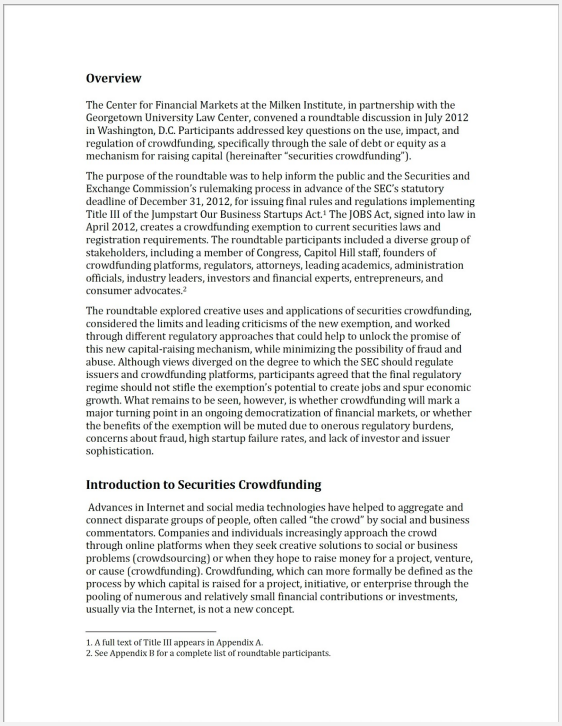
IN PARTNERSHIP WITH GEORGETOWN UNIVERSITY LAW CENTER

AUGUST 2012

BRADLEY D. BELT, CHRIS BRUMMER, AND DANIEL S. GORFINE



Overview

The Center for Financial Markets at the Milken Institute, in partnership with the Georgetown University Law Center, convened a roundtable discussion in July 2012 in Washington, D.C. Participants addressed key questions on the use, impact, and regulation of crowdfunding, specifically through the sale of debt or equity as a mechanism for raising capital (hereinafter "securities crowdfunding").

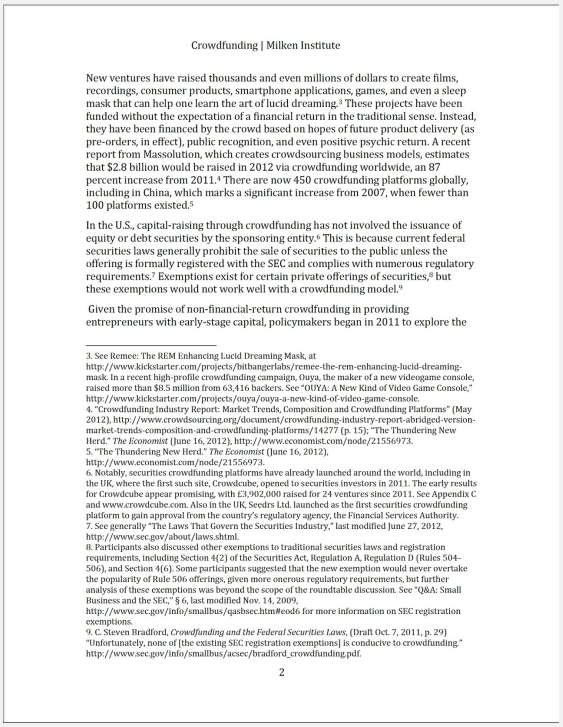
The purpose of the roundtable was to help inform the public and the Securities and Exchange Commission's rulemaking process in advance of the SEC's statutory deadline of December 31, 2012, for issuing final rules and regulations implementing Title III of the Jumpstart Our Business Startups Act.[1] The JOBS Act, signed into law in April 2012, creates a crowdfunding exemption to current securities laws and registration requirements. The roundtable participants included a diverse group of stakeholders, including a member of Congress, Capitol Hill staff, founders of crowdfunding platforms, regulators, attorneys, leading academics, administration officials, industry leaders, investors and financial experts, entrepreneurs, and consumer advocates.[2]

The roundtable explored creative uses and applications of securities crowdfunding, considered the limits and leading criticisms of the new exemption, and worked through different regulatory approaches that could help to unlock the promise of this new capital-raising mechanism, while minimizing the possibility of fraud and abuse. Although views diverged on the degree to which the SEC should regulate issuers and crowdfunding platforms, participants agreed that the final regulatory regime should not stifle the exemption's potential to create jobs and spur economic growth. What remains to be seen, however, is whether crowdfunding will mark a major turning point in an ongoing democratization of financial markets, or whether the benefits of the exemption will be muted due to onerous regulatory burdens, concerns about fraud, high startup failure rates, and lack of investor and issuer sophistication.

Introduction to Securities Crowdfunding

Advances in Internet and social media technologies have helped to aggregate and connect disparate groups of people, often called "the crowd" by social and business commentators. Companies and individuals increasingly approach the crowd through online platforms when they seek creative solutions to social or business problems (crowdsourcing) or when they hope to raise money for a project, venture, or cause (crowdfunding). Crowdfunding, which can more formally be defined as the process by which capital is raised for a project, initiative, or enterprise through the pooling of numerous and relatively small financial contributions or investments, usually via the Internet, is not a new concept.

1. A full text of Title III appears in Appendix A.
2. See Appendix B for a complete list of roundtable participants.



New ventures have raised thousands and even millions of dollars to create films, recordings, consumer products, smartphone applications, games, and even a sleep mask that can help one learn the art of lucid dreaming.[3] These projects have been funded without the expectation of a financial return in the traditional sense. Instead, they have been financed by the crowd based on hopes of future product delivery (as pre-orders, in effect), public recognition, and even positive psychic return. A recent report from Massolution, which creates crowdsourcing business models, estimates that $2.8 billion would be raised in 2012 via crowdfunding worldwide, an 87 percent increase from 2011.[4] There are now 450 crowdfunding platforms globally, including in China, which marks a significant increase from 2007, when fewer than 100 platforms existed.[5]

In the U.S., capital-raising through crowdfunding has not involved the issuance of equity or debt securities by the sponsoring entity.[6] This is because current federal securities laws generally prohibit the sale of securities to the public unless the offering is formally registered with the SEC and complies with numerous regulatory requirements.[7] Exemptions exist for certain private offerings of securities,[8] but these exemptions would not work well with a crowdfunding model.[9]

Given the promise of non-financial-return crowdfunding in providing entrepreneurs with early-stage capital, policymakers began in 2011 to explore the

3. See Remee: The REM Enhancing Lucid Dreaming Mask, at http://www.kickstarter.com/projects/hithangerlabs/remee-the-rem-enhancing-lucid-dreaming-mask. In a recent high-profile crowdfunding campaign, Ouya, the maker of a new videogame console, raised more than $8.5 million from 63,416 backers. See "OUYA: A New Kind of Video Game Console," http://www.kickstarter.com/projects/ouya/ouya-a-new-kind-of-video-game-console.
4. "Crowdfunding Industry Report: Market Trends, Composition and Crowdfunding Platforms" (May 2012), http://www.crowdsourcing.org/document/crowdfunding-industry-report-abridged-version-market-trends-composition-and-crowdfunding-platforms/14277 (p. 15); "The Thundering New Herd," *The Economist* (June 16, 2012), http://www.economist.com/node/21556973.
5. "The Thundering New Herd," *The Economist* (June 16, 2012), http://www.economist.com/node/21556973.
6. Notably, securities crowdfunding platforms have already launched around the world, including in the UK, where the first such site, Crowdcube, opened to securities investors in 2011. The early results for Crowdcube appear promising, with £3,902,000 raised for 24 ventures since 2011. See Appendix C and www.crowdcube.com. Also in the UK, Seedrs Ltd. launched as the first securities crowdfunding platform to gain approval from the country's regulatory agency, the Financial Services Authority.
7. See generally "The Laws That Govern the Securities Industry," last modified June 27, 2012, http://www.sec.gov/about/laws.shtml.
8. Participants also discussed other exemptions to traditional securities laws and registration requirements, including Section 4(2) of the Securities Act, Regulation A, Regulation D (Rules 504-506), and Section 4(6). Some participants suggested that the new exemption would never overtake the popularity of Rule 506 offerings, given more onerous regulatory requirements, but further analysis of these exemptions was beyond the scope of the roundtable discussion. See "Q&A: Small Business and the SEC," § 6, last modified Nov. 14, 2009, http://www.sec.gov/info/smallbus/qasbsec.htm#eod6 for more information on SEC registration exemptions.
9. C. Steven Bradford, *Crowdfunding and the Federal Securities Laws*, (Draft Oct. 7, 2011, p. 29) "Unfortunately, none of [the existing SEC registration exemptions] is conducive to crowdfunding." http://www.sec.gov/info/smallbus/acsec/bradford_crowdfunding.pdf.

FinTech: Building a 21st-Century Regulator's Toolkit

By Chris Brummer and Daniel Gorfine

October 2014

In recent years we have witnessed a torrent of technology-driven innovation in financial markets and services. This innovation, in turn, is reshaping how markets are structured, how investors receive and use information, how customers receive and use financial services, and how companies access and deploy capital. Ranging from new digital payment systems and digital or electronic currencies to online investment/finance platforms and data analytics, these developments, collectively called FinTech, are already having an impact on traditional financial markets and services. Less discussed, however, is how the rise of FinTech challenges underlying precepts of existing regulatory approaches and requires fresh thinking as to how regulation can best foster the responsible development of this industry.[1]

How can regulation best foster the responsible development of the FinTech industry?

We tackle some of these issues in the pages that follow. That said, we do not proclaim absolute policy prescriptions, which are rarely possible in a world of dynamic, sophisticated, ever-changing markets. Instead, as we will argue, regulatory policies that match these dynamics with the versatile application of agile approaches and tools, as discussed further below, will more likely ensure market integrity and transparency, investor protection, and capital formation.

With this in mind, this paper outlines characteristics of FinTech that drive the need for new thinking about today's regulatory approaches, and then details the pros and cons of alternative regulatory responses—which themselves can and will be deployed in varying contexts and scenarios.

Rapid change and innovation are already the norm in technology-driven sectors, and perhaps more so in financial markets and services. A failure to account for these trends will result in regulatory frameworks that fall short of their goals, impede positive innovation, and reduce competitiveness of local economies and businesses. The following discussion, which begins with a brief summary of the growth of FinTech, is an attempt to catalyze efforts to provide policymakers with a "toolkit" that can keep pace with FinTech developments.

2019 (April 08) - "Chris Brummer joins the Milken Institute as a Senior Fellow, brings expertise in international finance to Institute's Center for Financial Market Understanding in Washington, D.C."

https://milkeninstitute.org/articles/chris-brummer-joins-milken-institute-senior-fellow-brings-expertise-international-finance

2019-04-08-milken-institute-chris-brummer-joins-the-milken-institute-as-senior-fellow.pdf

(LOS ANGELES) — Chris Brummer, professor of law at Georgetown University Law Center, has joined the Milken Institute as a senior fellow. He will bring his expertise in international financial regulation, market microstructure, securities regulation, and international trade to the work of the Institute and its recently established Center for Financial Market Understanding in Washington, D.C.

The Center is charged with increasing policymakers' understanding of the operations of financial markets in the U.S. and worldwide, with a focus on the myriad impacts of policy decisions, both intended and not. Brummer's grasp of the connectedness of markets around the world will help the Milken Institute offer legislators, regulators, executives and journalists a greater insight into how markets function.

"Chris brings an entrepreneurial approach to his work — a trait that's perhaps unusual in law professors," said Bradley Belt, senior managing director and head of the Center for Financial Market Understanding. "His depth of knowledge about regulation in overseas markets and the increasingly connected global economy will enrich the resources we can offer to leaders in policy and business."

Brummer has taught at the University of Basel, and will serve as a visiting professor next year at the University of Heidelberg and the London School of Economics. Before coming to Georgetown, he was an assistant professor of law at Vanderbilt University Law School. He also practiced law in the New York and London offices of Cravath, Swaine & Moore, where his practice focused on high-yield debt offerings. In 2008, he was the Securities and Exchange Commission's first academic fellow, and worked in the Office of International Affairs.

"I'm delighted to have the opportunity to join the Milken Institute, particularly at this point in time, when one sees the need for a more focused, less ideological policy discussion on financial markets and their role in society," Brummer said. "No other institution brings to the table the energy and creative thinking required for tackling the emerging challenges of the modern financial marketplace."

Brummer's research has appeared in many of the country's most prestigious journals, including the California Law Review, the University of Chicago Law Review, the Georgetown Law Journal, the Southern California Law Review and the Vanderbilt Law Review. He periodically serves as an expert on NASDAQ hearings panels on de-listings.

Brummer lectures widely on finance and global governance at universities. His book, "Soft Law and the Global Financial System," will be published later this year by Cambridge University Press. He earned his J.D. from Columbia Law School, where he graduated with honors, and holds a Ph.D. in Germanic studies from the University of Chicago.

Also 2019-04-08 - "PRESS RELEASE : Milken Institute and Georgetown University launch congressional staff briefing series"

https://milkeninstitute.org/articles/milken-institute-and-georgetown-university-launch-congressional-staff-briefing-series

The interactive, informal session, "The Future of Wall Street After Dodd-Frank," covered market responses to the legislation and looked at how the markets have changed since Dodd-Frank was enacted. This is the first in a monthly series of Milken Institute-Georgetown University briefings for congressional staff on topical financial markets issues.

"The Milken Institute is pleased to partner with Georgetown in launching this briefing series," said Bradley Belt, senior managing director of the Milken Institute. "We believe it is critically important to bring a market-based perspective to the discussion of how the laws and regulations affect markets and whether the results intended by the sponsors will be achieved."

Opening today's discussion were leading financial experts from Georgetown University and the Milken Institute, including Rohan Williamson, associate professor of finance and Stallkamp Faculty Research Fellow at the McDonough School of Business, along with Phillip Swagel, professor of international economic policy at the University of Maryland.

"We found this a terrific opportunity to engage with congressional staff members who want to gain a deeper understanding of the intended and unintended effects of financial legislation," said Chris Brummer, professor of law at Georgetown and a Milken Institute senior fellow. "Our discussion focused on market responses to the law and to other forces and events."

2021 (Jan21)

https://www.pymnts.com/personnel/2021/biden-announces-admin-changes-sec-ftc-cftc/

(also see - https://www.coindesk.com/chris-brummer-to-be-bidens-cftc-chair-crypto-friendly-tarbert-steps-down)

The new acting chair of the Securities and Exchange Commission (SEC) will be Commissioner Allison Herren Lee as designated by President Joe Biden, according to a press release.

“During my time as commissioner, I have focused on climate and sustainability, and those issues will continue to be a priority for me,” she said, according to the release.

Lee was sworn in as commissioner in 2019, and she has written, lectured and taught courses on the financial regulation and corporate law, the release stated. She has also been with the SEC for years in various roles, including counsel to Commissioner Kara Stein and as senior counsel in the Division of Enforcement’s Complex Financial Instruments Unit.

In addition, Federal Trade Commission (FTC) Commissioner Rebecca Kelly Slaughter will be acting chair of the agency as designated by Biden, according to a press release.

Slaughter, in her position as commissioner thus far, has advocated for greater FTC resources, promoting equity and inclusion efforts, the release stated. In addition, Slaughter has been “outspoken” about fighting systemic racism, growing threats to competition and the “broad abuse” of consumers’ data.

Also, Heath Tarbert, a former President Donald Trump nominee, has stepped down as Commodity Futures Trading Commission (CFTC) chair as of Thursday (Jan. 21), Reuters reported.

The leading candidate emerging to replace him is Georgetown University academic Chris Brummer, the report stated, with the White House expected to make a decision soon.

Democratic CFTC commissioner Rostin Behnam is set to serve as acting commissioner for the time being, Reuters reported. Tarbert is going to remain on the commission as he transitions to private life.

Biden took office Wednesday (Jan. 20) and set about signing executive orders, PYMNTS reported. Many of them focused on fighting the pandemic, including orders for mask mandates in federal buildings, establishing a coordinator of the COVID-19 response to lead vaccine rollouts, and establishing ways to safely reopen schools.

Did Melissa Hodgman and Chris Brummer work together at the SEC ?

We can find no evidence that they worked together directly, which is contrary to some claims found on the internet of alleged collusion. Only indirect, for example

Brent Fields + Melissa Hodgman working togehter (https://www.sec.gov/litigation/admin/2019/34-84998.pdf) , and Brummer worked with Brent Fields (https://www.sec.gov/comments/sr-iex-2018-06/iex201806-3492198-162258.pdf / 2018-04-sec-gov-iex201806-3492198-162258)

Tax policy

The Institute has held several events regarding Opportunity zones created by the Tax Cuts and Jobs Act of 2017. In May 2018, Treasury Secretary Steven Mnuchin instructed his staff to accept a non-low-income tract in Storey County, Nevada as an Opportunity Zone shortly after attending an Institute event in Beverly Hills with Michael Milken.[18] Milken was already an investor in the Nevada tract.[18] In August 2018, Mnuchin attended an Institute conference on Opportunity Zones in the Hamptons with Milken and latter accepted a flight to Los Angeles with Milken on his private jet.[18] Treasury later issued a regulatory guidance at the Institute's request that allows prior investors to benefit from newly designated Opportunity Zones.[18]

NOTE - "chris brummer" + "opportunity zones" , no connections found on Google

https://home.solari.com/opportunity-zones-prototyping-community-technocracy-with-patrick-wood/

In this segment, Patrick and I take a look at Opportunity Zones—a U.S. tax shelter investment vehicle authorized by the Tax Cuts and Jobs Act of 2017.

Opportunity Zones teams are prototyping technocracy's "last mile" in the United States. As global capital returns to North America, opportunities in real estate abound. Entrepreneurs and investors can shift enormous unrealized capital gains out of tech companies and the stock market at a relative high and into real estate (and related digital integration in communities) at relative low prices.

Put aside your prism of national competition. Look at the world through the prism of digital control—the competition to own and access the satellites, telecommunications, information systems, software, and AI that implement "the databeast" is reaching a fever pitch. Or, as Patrick says, "data is the new oil," and we are entering a new period of "digital despotism."

HENRY W. BUSE

H. W. BUSE DIES IN HOSPITAL

Widely Known Ridley Park Official Ill Only Short Time

Henry W. Buse, tax collector and former burgess of Ridley Park, died at 2 a. m. today in Temple University Hospital, Philadelphia, following a two weeks' illness. Death came after an operation which he underwent Wednesday.

Mr. Buse was widely identified with borough and county affairs, and was past president of the Delaware County Association of Burgesses and Township Commissioners, popularly known as the Burgi, in which he was very active.

He founded and was the first president of the Chester Pike Rotary Club, was a life member of Ridley Park Fire Company No. 1 and was a past president of the Men's Club of Christ Protestant Episcopal Church, Ridley Park.

Throughout the east he was known for his famous lecture on "What Fools We Mortals Be," which he gave many times in connection with his work with the Delaware County Safety Council and other highway safety groups. He was active in the Keystone Automobile Club.

Mr. Buse's other memberships included the Benevolent and Protective Order of Elks, Chester; the Union League, and E. Coppee Mitchell Lodge No. 605, F. and A. M., of which he was a past master. He was a former Ridley Park councilman.

Mr. Buse, who lived at 3 Bartol avenue, Ridley Park, was associated with the insurance business for many years, and formerly was connected with a typewriter company in Philadelphia.

He is survived by his widow, Mrs. Stella Buse; a daughter, Elizabeth Buse, of Ridley Park, and a son, Captain H. W. Buse, Jr., of the United States Marine Corps. A granddaughter, Barbara Ann Buse, also survives.

Another son, Rowland Buse, who was a U. S. Navy aviator, was killed in May, 1928, in a plane crash. Both Rowland and Captain Buse were graduated from the U. S. Naval Academy at Annapolis.

Passed-Over General Asks To Be Retired

locked door. The Brooklyn cam-

WASHINGTON (AP) —A senior Marine general whose star rose under former Secretary of Defense Robert S. McNamara has put in for retirement.

He is Lt. Gen. Victor H. Krulak, passed over for Marine commandant and considered a leading contender for two other top posts until they were filled earlier this month by others.

The White House said President Johnson is nominating Krulak for permanent rank of lieutenant general when he retires about June 1.

For the last four years, Krulak has commanded Fleet Marine Forces in the Pacific with headquarters in Honolulu.

Krulak, 55, came to McNamara's attention while serving as a specialist on counterinsurgency under the Joint Chiefs of Staff.

It was reported President John F. Kennedy also was impressed with Krulak, who is credited with a major role in developing clear-and-hold tactics used by the Marines in Vietnam until major North Vietnamese incursions changed the character of the war.

Although Krulak was considered at one time the leading contender for Marine commandant, Johnson chose Gen. Leonard F. Chapman Jr. last December.

Johnson made his announcement five days after McNamara's intention to leave the Pentagon was made public. Krulak reportedly was McNamara's first choice.

In subsequent months, sources said Krulak was a leading candidate to become commander in chief of all Pacific forces—a job that would have meant promotion to full general. He also was mentioned as possible deputy to the U.S. commander in Vietnam, also a four star post.

But on April 10 Johnson named Adm. John S. McCain Jr. to become commander in chief of the Pacific and Army Gen. Andrew Goodpaster for the deputy position in Saigon.

Krulak, a native of Denver, Colo. is said by some sources to be planning to retire to San Diego, Calif.

The Pentagon said his successor as commanding general of Pacific Fleet Marine Froces will be Lt. Gen. Henry W. Buse, 56, a native of Ridley Park, Pa. Buse now is chief of staff at Marine headquarters.

A good reference of Buse's activities in Vietnam is in the 1988 book **"United States Marines in Vietnam - High mobility and standdown"** by Charles R Smith (see 1988-us-marines-in-vietnam-high-mobility-and-standdown-full-charles-r-smith.pdf / https://drive.google.com/open?id=1Cq55zUDuHuRBI0gdw3Qbz50exY6g5_xJ)

Do You Own or Use a Typewriter?

THE NEW CUSHIONED KEYS SHOULD INTEREST EVERY MANUFACTURER, DEALER, OWNER AND USER OF A WRITING MACHINE.

An Operator Can do More Work, do it Better and with Less Fatigue. Your Machine will Cost Less for Repairs, Speed will be Increased, and the Operator's Life will be Worth Living. Do You go Home after a Hard Day's Work, ... Tired, Nervous and Exhausted? . . . . . .

Read the following from a young lady connected with one of New York's great daily papers:

"I want to express my deep appreciation of your inestimable patent cushions for the typewriter keys. They are one of the greatest labor-saving devices, and most valuable adjunct to the typewriter, ever invented.

Singularly, indeed, but at the end of the day now my hands are far more rested than formerly at the start. The cushioned keys save the fingers all toil, and wonderfully soften them by manipulation.

I trust the day may come when they shall have reached all typewriters, and none will be deprived of their benefit. With sincere appreciation and gratitude, etc."
